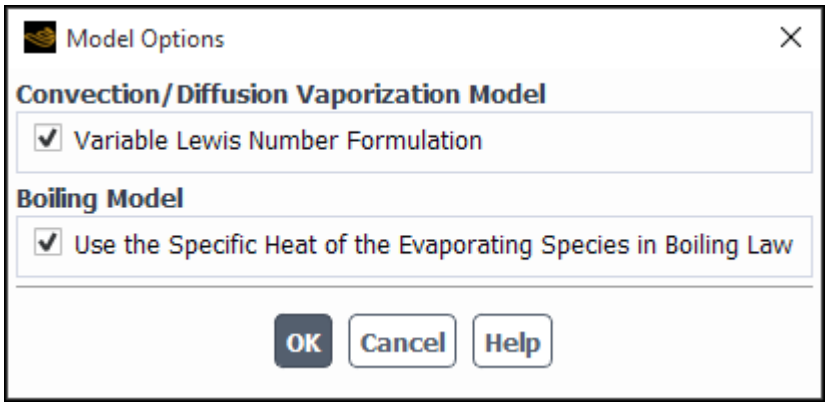
The **Model Options** dialog box allows you to select boiling model options and to enable the calculation of the Spalding heat number for the convection/diffusion vaporization model. This dialog box opens when you click **Edit...** next to **Vaporization Model** in the Create/Edit Materials Dialog Box (p. 4833).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Convection/Diffusion Vaporization Model

allows you to enable **Variable Lewis Number Formulation** if you want to compute the Spalding heat number from Equation 12.96 in the *Fluent Theory Guide*. This group box is available only when you select **convection/diffusion-controlled** for **Vaporization/Boiling Model**.

Boiling Model

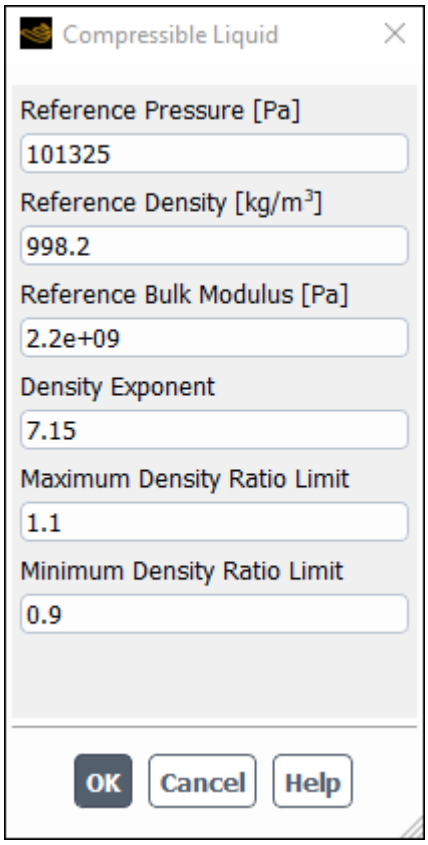
is where you can select the **Use the Specific Heat of the Evaporating Species in Boiling Law** option. This option sets the heat capacity of the gas ($c_{p,\infty}$ in Equation 12.101 in the *Fluent Theory Guide*) to the specific heat of the evaporating species selected in the **Set Injection Properties** dialog box. For the convection/diffusion controlled model with the **Variable Lewis Number Formulation**, this option is selected by default. This ensures consistency with the convection/diffusion controlled model expression for B_T in Equation 12.95 in the *Fluent Theory Guide*.

For more information, see Description of the Properties (p. 2814).

50.5.15. Compressible Liquid Dialog Box

The **Compressible Liquid** dialog box allows you to model liquid compressibility for high pressure applications using the Tait equation of state. This dialog box will open when you select **compressible-liquid** in the drop-down list next to one of the **Properties** in the Create/Edit Materials Dialog Box (p. 4833). See Compressible Liquid Density Method (p. 1600) for details about using the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reference Pressure

sets the reference pressure.

Reference Density

sets the reference density.

Reference Bulk Modulus

sets the reference bulk modulus.

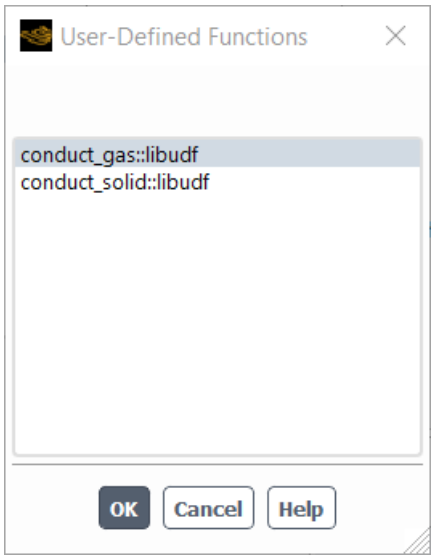
Density Exponent

sets the density exponent.

50.5.16. User-Defined Functions Dialog Box

The **User-Defined Functions** dialog box allows you to choose which user-defined function is to be used to define a material property. This dialog box will open when you select **user-defined** in the drop-down list next to one of the **Properties** in the Create/Edit Materials Dialog Box (p. 4833). See the separate Fluent Customization Manual for details about user-defined functions.

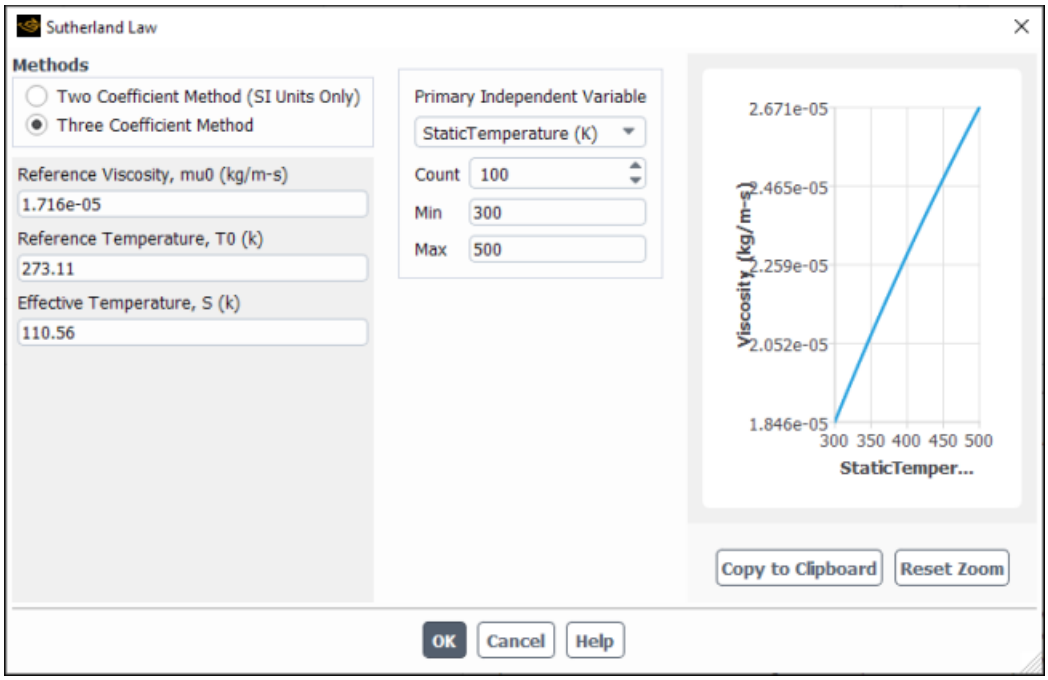
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The list will contain all available user-defined functions.

50.5.17. Sutherland Law Dialog Box

The **Sutherland Law** dialog box allows you to set the coefficients for Sutherland's law for viscosity. This dialog box will open when you select **sutherland** in the drop-down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See Sutherland Viscosity Law (p. 1610) for details about the items below.



Controls

Methods

contains options for selecting the **Two Coefficient Method** or the **Three Coefficient Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C1, C2

set the coefficients C_1 and C_2 in Equation 8.24 (p. 1610) in SI units. These inputs will appear if you select the **Two Coefficient Method**.

Reference Viscosity

sets the reference viscosity μ_0 in Equation 8.25 (p. 1610). This input will appear if you select the **Three Coefficient Method**.

Reference Temperature

sets the reference temperature T_0 in Equation 8.25 (p. 1610). This input will appear if you select the **Three Coefficient Method**.

Effective Temperature

sets the effective temperature S in Equation 8.25 (p. 1610). This input will appear if you select the **Three Coefficient Method**.

Primary Independent Variable

allows you to select which variable is the independent variable.

Count

allows you to specify the number of plot points.

Min

sets the minimum value for the independent variable.

Max

sets the maximum value for the independent variable.

Copy to Clipboard

copies the current plot onto your clipboard.

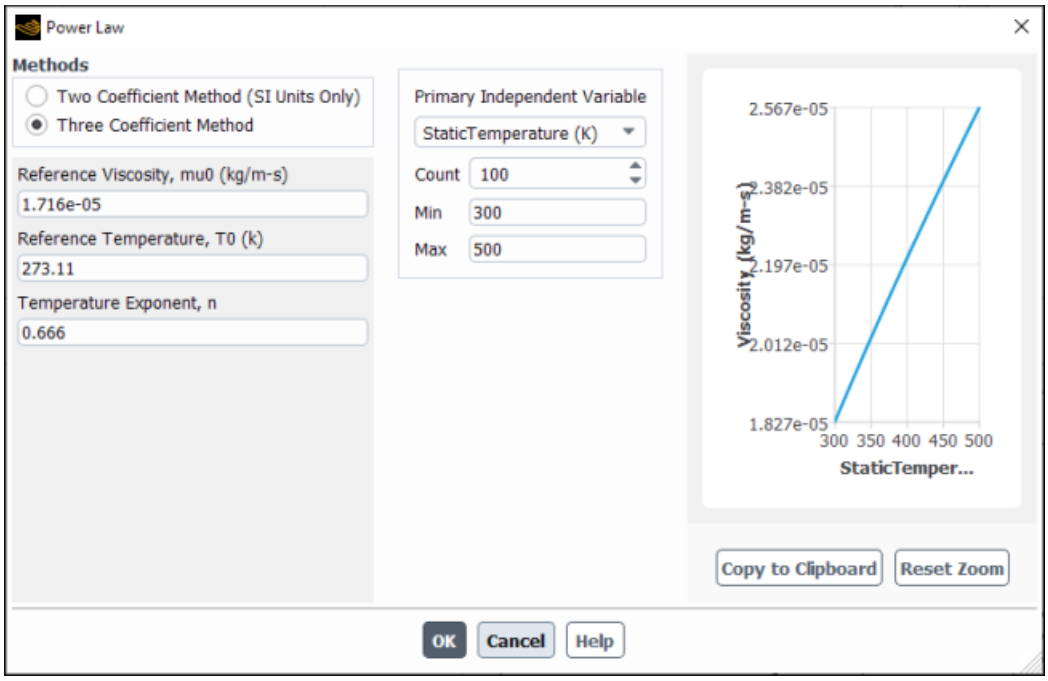
Reset Zoom

resets to the default zoom. *You can click and drag in the plot to change the zoom level.*

50.5.18. Power Law Dialog Box

The **Power Law** dialog box allows you to set the coefficients for the power law for viscosity. This dialog box will open when you select **power-law** in the drop-down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See Power-Law Viscosity Law (p. 1611) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods

contains options for selecting the **Two Coefficient Method** or the **Three Coefficient Method**.

B

sets the coefficient B in Equation 8.26 (p. 1611) in SI units. This input will appear if you select the **Two Coefficient Method**.

Reference Viscosity

sets the reference viscosity μ_0 in Equation 8.27 (p. 1611). This input will appear if you select the **Three Coefficient Method**.

Reference Temperature

sets the reference temperature T_0 in Equation 8.27 (p. 1611). This input will appear if you select the **Three Coefficient Method**.

Temperature Exponent

sets the temperature exponent n in Equation 8.26 (p. 1611) or Equation 8.27 (p. 1611), depending on your **Method** selection. If you are using the **Two Coefficient Method**, this input must be in SI units.

Primary Independent Variable

allows you to select which variable is the independent variable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Count

allows you to specify the number of plot points.

Min

sets the minimum value for the independent variable.

Max

sets the maximum value for the independent variable.

Copy to Clipboard

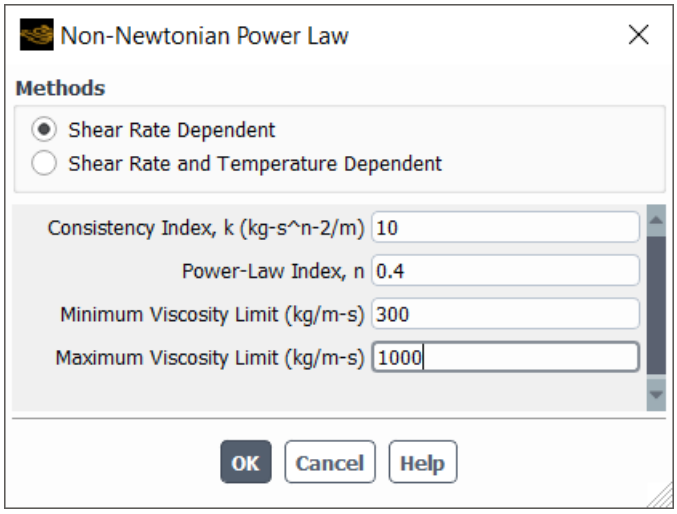
copies the current plot onto your clipboard.

Reset Zoom

resets to the default zoom. *You can click and drag in the plot to change the zoom level.*

50.5.19. Non-Newtonian Power Law Dialog Box

The **Non-Newtonian Power Law** dialog box allows you to set the parameters for the non-Newtonian power law for viscosity. This dialog box will open when you select **non-newtonian-power-law** in the drop-down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See Power Law for Non-Newtonian Viscosity (p. 1615) for details about the items below.



Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Consistency Index

sets the consistency index k in Equation 8.39 (p. 1615).

Power-Law Index

sets the power-law index n in Equation 8.39 (p. 1615).

Minimum Viscosity Limit, Maximum Viscosity Limit

set the minimum and maximum viscosity limits.

Reference Temperature

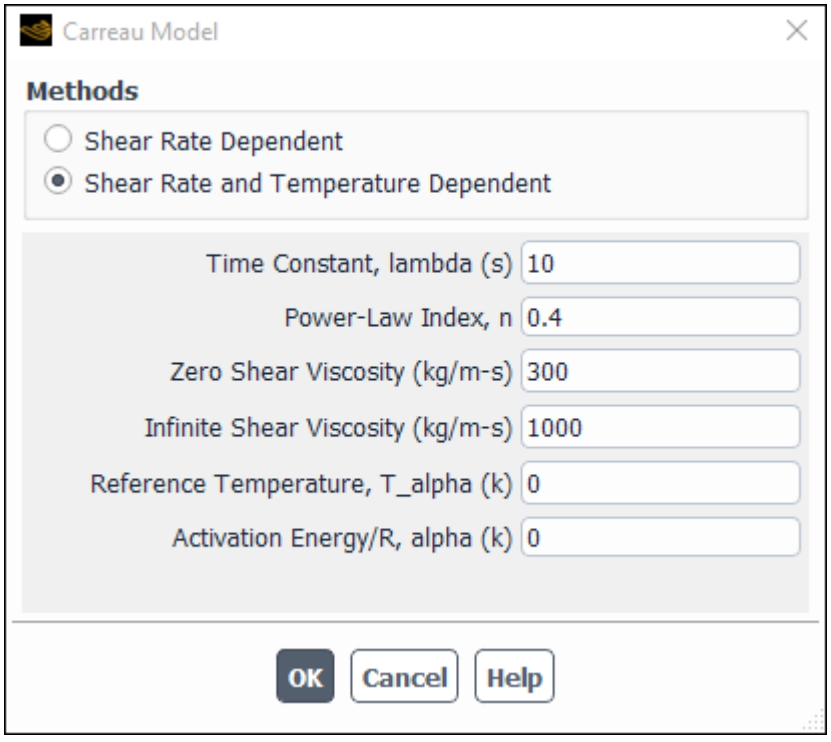
sets the reference temperature.

Activation Energy/R, alpha

is the ratio of the activation energy to the thermodynamic constant α in Equation 8.38 (p. 1614).

50.5.20. Carreau Model Dialog Box

The **Carreau Model** dialog box allows you to set the parameters for the non-Newtonian Carreau model for viscosity. This dialog box will open when you select **carreau** in the drop-down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See The Carreau Model for Pseudo-Plastics (p. 1615) for details about the items below.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Time Constant, lambda

sets the time constant λ in Equation 8.40 (p. 1615).

Power-Law Index

sets the power-law index n in Equation 8.40 (p. 1615).

Zero Shear Viscosity, Infinite Shear Viscosity

set the zero and infinite shear viscosity limits η_0 and η_∞ in Equation 8.40 (p. 1615).

Reference Temperature, T_alpha

sets the reference temperature T_0 in Equation 8.40 (p. 1615).

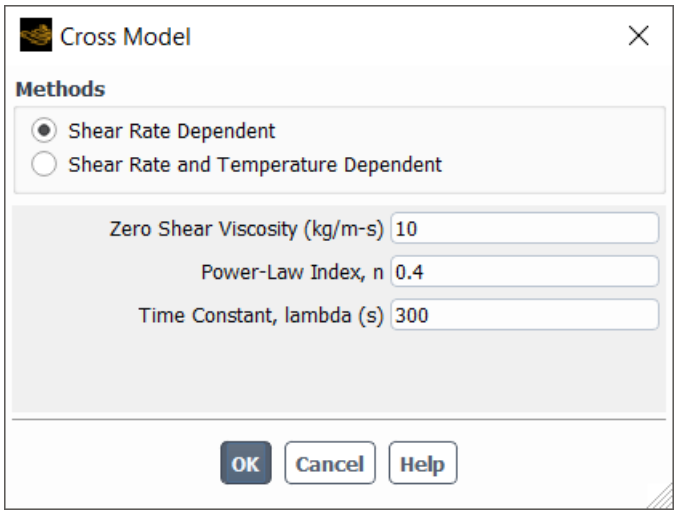
Activation Energy/R, alpha

is the ratio of the activation energy to the thermodynamic constant α in Equation 8.38 (p. 1614).

50.5.21. Cross Model Dialog Box

The **Cross Model** dialog box allows you to set the parameters for the non-Newtonian Cross model for viscosity. This dialog box will open when you select **cross** in the drop-down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See Cross Model (p. 1616) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Zero Shear Viscosity

sets the zero shear viscosity limit η_0 in Equation 8.41 (p. 1616).

Power-Law Index

sets the power-law index n in Equation 8.41 (p. 1616).

Time Constant

sets the time constant λ in Equation 8.41 (p. 1616).

Reference Temperature, T_alpha

sets the reference temperature T_0 in Equation 8.40 (p. 1615).

Activation Energy/R, alpha

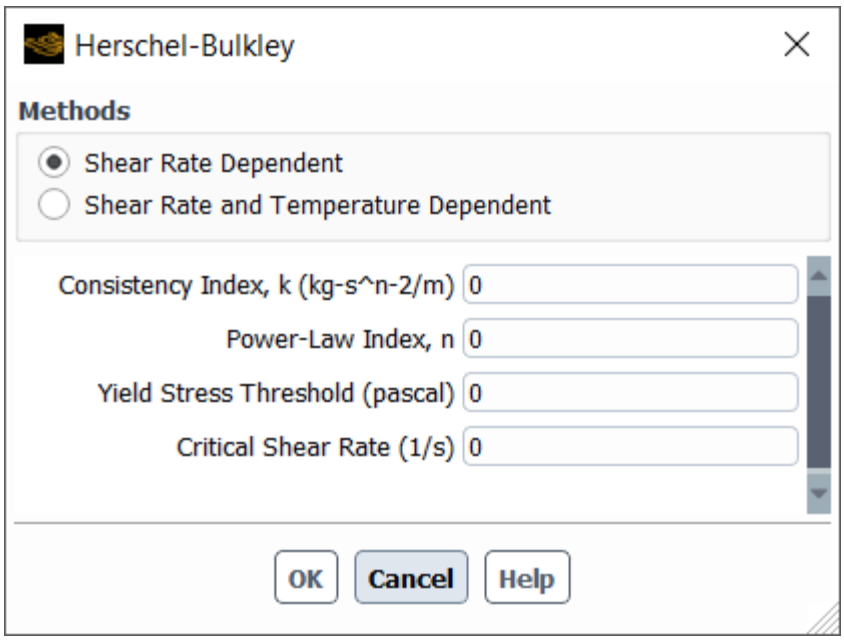
is the ratio of the activation energy to the thermodynamic constant α in Equation 8.38 (p. 1614).

50.5.22. Herschel-Bulkley Dialog Box

The **Herschel-Bulkley** dialog box allows you to set the parameters for the non-Newtonian Herschel-Bulkley model for viscosity. This dialog box will open when you select **herschel-bulkley** in the drop-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

down list next to **Viscosity** in the Create/Edit Materials Dialog Box (p. 4833). See Herschel-Bulkley Model for Bingham Plastics (p. 1617) for details about the items below.



Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Consistency Index

sets the consistency index k in Equation 8.43 (p. 1617).

Power-Law Index

sets the power-law index n in Equation 8.43 (p. 1617).

Yield Stress Threshold

sets the yield stress threshold τ_0 in Equation 8.43 (p. 1617).

Critical Shear Rate

set the critical shear rate $\dot{\gamma}_c$ in Equation 8.43 (p. 1617).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Temperature, T_alpha

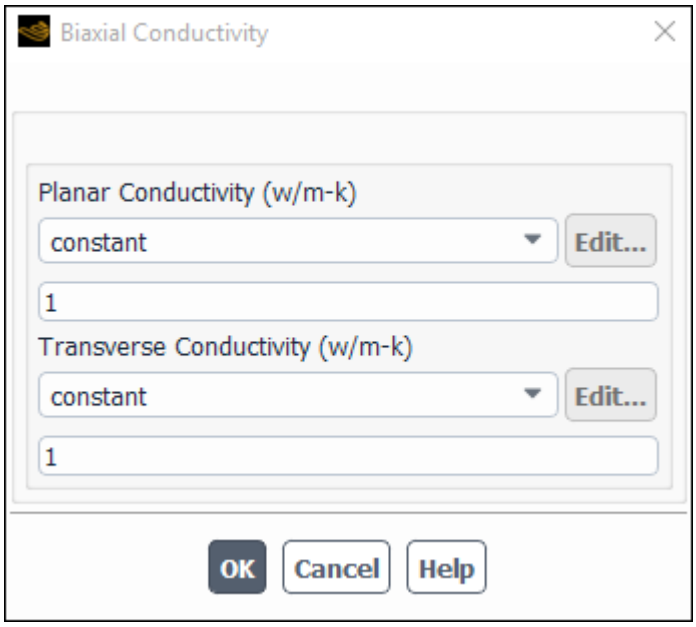
sets the reference temperature T_α in Equation 8.38 (p. 1614).

Activation Energy/R, alpha

is the ratio of the activation energy to the thermodynamic constant α in Equation 8.38 (p. 1614).

50.5.23. Biaxial Conductivity Dialog Box

The **Biaxial Conductivity** dialog box allows you to define a biaxial orthotropic thermal conductivity, which is applicable to solid materials used for the wall shell conduction model. This dialog box will open when you select **biaxial** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 4833). See Biaxial Thermal Conductivity (p. 1624) for details about the items below.



Controls

Planar Conductivity

specifies the conductivity within the shell (or solid) region.

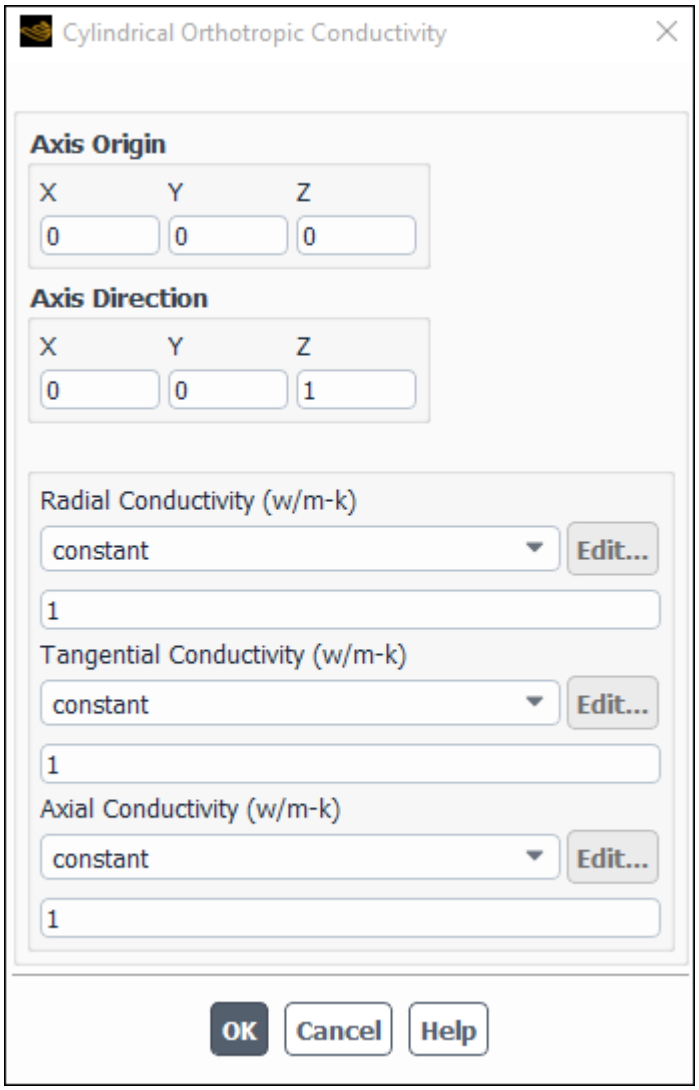
Transverse Conductivity

specifies the conductivity normal to the surface of the solid region.

50.5.24. Cylindrical Orthotropic Conductivity Dialog Box

The **Cylindrical Orthotropic Conductivity** dialog box allows you to define an orthotropic thermal conductivity in cylindrical coordinates. This dialog box will open when you select **cyl-orthotropic** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 4833). See Cylindrical Orthotropic Thermal Conductivity (p. 1626) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Axis Origin

allows you to specify the origin of the cylindrical coordinate system.

X, Y, Z

specify the X, Y, and (for 3D cases) Z coordinates.

Axis Direction

(3D only) allows you to specify the direction of the axis.

X, Y, Z

specify 1 against the direction of the axis.

Radial Conductivity

specifies the conductivity in the radial direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Tangential Conductivity

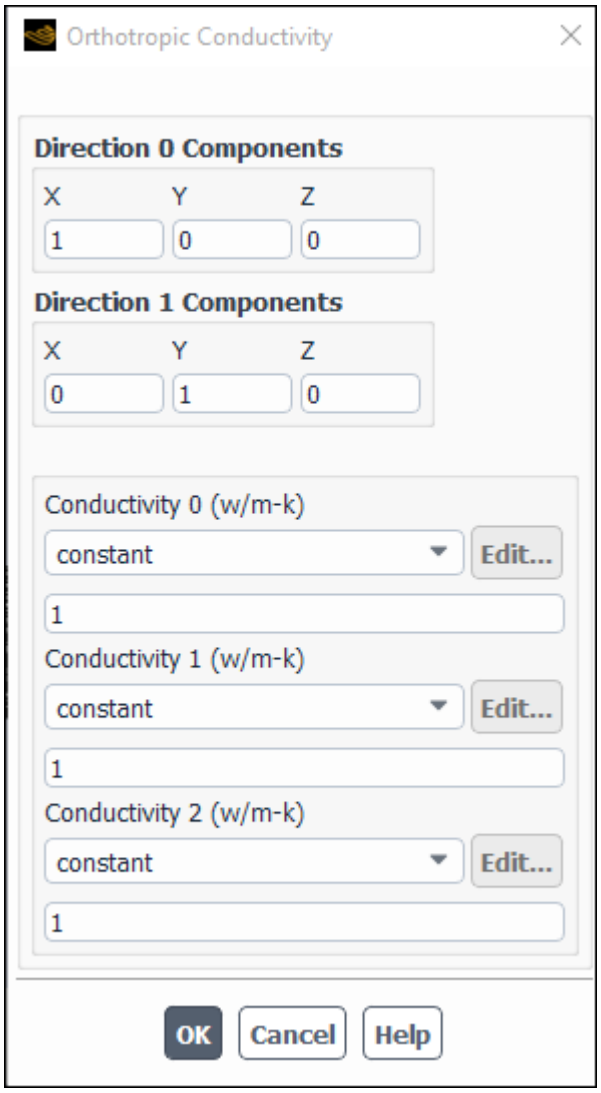
specifies the conductivity in the tangential direction.

Axial Conductivity

(3D only) specifies the conductivity in the axial direction.

50.5.25. Orthotropic Conductivity Dialog Box

The **Orthotropic Conductivity** dialog box allows you to define an orthotropic thermal conductivity for a solid material, using principal directions that do not have to aligned with the global coordinate system of the simulation. This dialog box will open when you select **orthotropic** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 4833). See Orthotropic Thermal Conductivity (p. 1624) for details about the items below.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction 0 Components, Direction 1 Components

specify the directions $\hat{e}_\xi$ and $\hat{e}_\eta$ in Equation 8.54 (p. 1624) as **X,Y,Z** vectors. For 2D cases, only **Direction 0 Components** will appear.

Conductivity 0, Conductivity 1, Conductivity 2

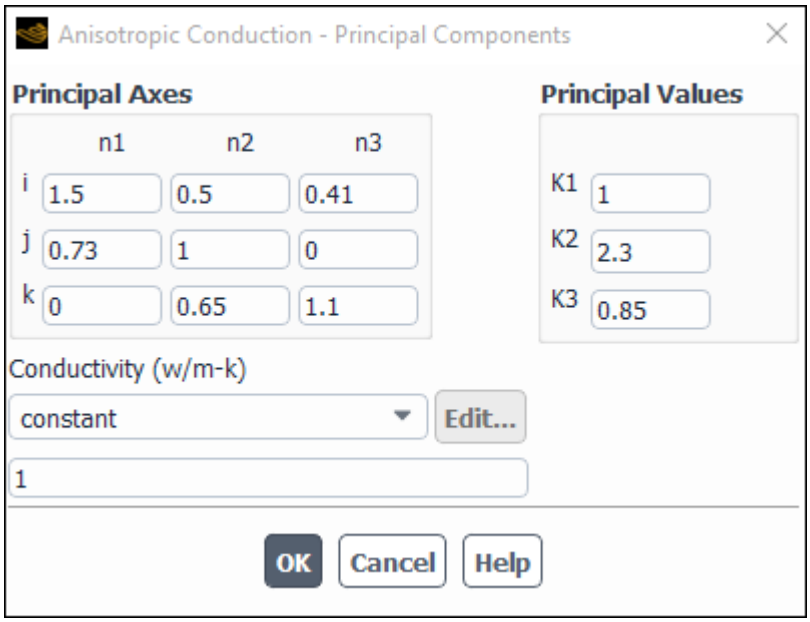
specify (k_ξ), (k_η), and (k_ζ) in Equation 8.54 (p. 1624) as **constant**, **polynomial**, **piecewise-linear**, **piecewise-polynomial**, functions of temperature, **user-defined**, or **expression**. For 2D cases, only **Conductivity 0** and **Conductivity 1** will appear.

Edit...

opens the appropriate dialog box so you can enter a temperature-dependent conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

50.5.26. Anisotropic Conduction - Principal Components Dialog Box

The **Anisotropic Conduction - Principal Components** dialog box allows you to define an anisotropic thermal conductivity using the components of the principal axes (which do not have to be orthogonal and/or aligned with the global coordinate system) and the associated principal values. This dialog box will open when you select **principal-axes-values** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 4833). See Principal Axes and Principal Values (p. 1628) for details about the items that follow.



Controls

Principal Axes

specifies the $\hat{i}$, $\hat{j}$, and $\hat{k}$ components of the $\vec{n}^1$, $\vec{n}^2$, and $\vec{n}^3$ vectors (in Equation 8.55 (p. 1628)) that define the principal axes of the anisotropic material. Note that these vectors must be linearly independent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Principal Values

specifies the principal values (K_1, K_2, and K_3 in Equation 8.58 (p. 1629)) associated with the principal axes.

Conductivity

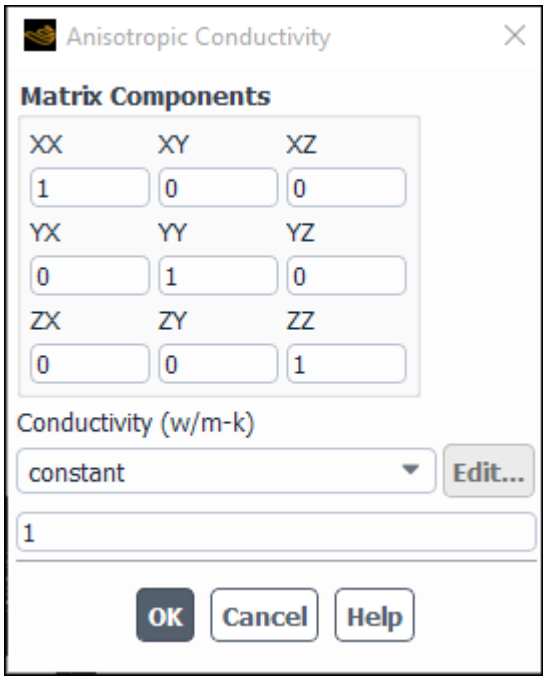
specifies the value of k (in Equation 8.58 (p. 1629)) as a **constant**, function of temperature (**polynomial**, **piecewise-linear**, **piecewise-polynomial**), or **user-defined** function.

Edit...

opens the appropriate dialog box for the definition of a temperature-dependent or user-defined conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

50.5.27. Anisotropic Conductivity Dialog Box

The **Anisotropic Conductivity** dialog box allows you to define a general anisotropic thermal conductivity. This dialog box will open when you select **anisotropic** in the drop-down list next to **Thermal Conductivity** in the Create/Edit Materials Dialog Box (p. 4833). See Anisotropic Thermal Conductivity (p. 1622) for details about the items below.



Controls

Matrix Components

specify the components of the matrix $\hat{e}_{ij}$ in Equation 8.53 (p. 1623).

Conductivity

specifies the value of k in Equation 8.53 (p. 1623) as a **constant**, function of temperature (**polynomial**, **piecewise-linear**, **piecewise-polynomial**), or **user-defined** function.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

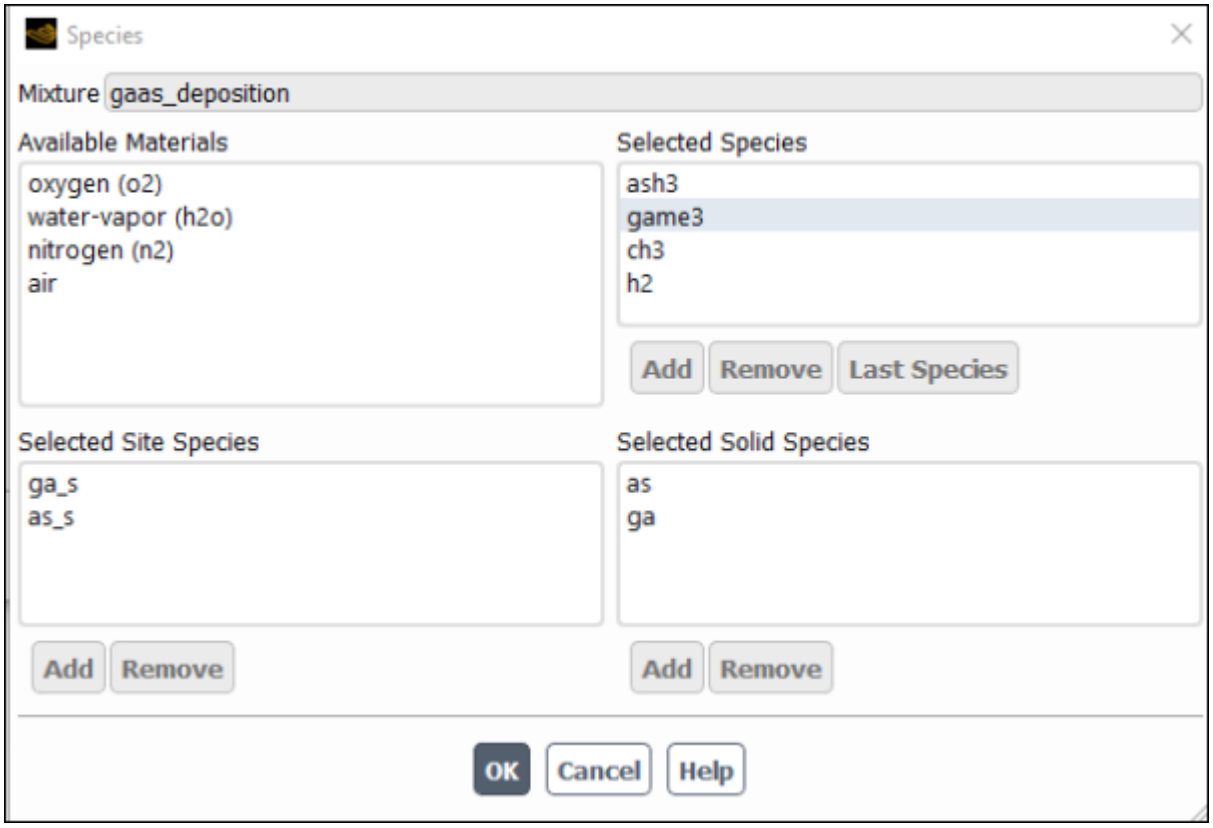
Edit...

opens the appropriate dialog box so you can enter a temperature-dependent or user-defined conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

50.5.28. Species Dialog Box

The **Species** dialog box (opened by clicking the **Edit...** button next to **Mixture Species** in the Create/Edit Materials Dialog Box (p. 4833))) allows you to define the species that make up a mixture material. See Defining the Species in the Mixture (p. 2372) for details about the items below.

(Note that the **Species** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Mixture

shows the name of the mixture material for which you are defining the species. This field is not editable.

Available Materials

is a list of all of the materials to be a component in the mixture material by selecting it and clicking the **Add** button below the **Selected Species** or **Selected Surface Species** list. To add a material to the **Available Materials** list, use the Fluent Database Materials Dialog Box (p. 4845) to copy the fluid material to local storage.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Selected Species

is a list of all the fluid-phase species in the mixture. You can modify the list as follows:

- To add a material to the list, select it in the **Available Materials** list and click the **Add** button below the **Selected Species** list.
- To remove a material, select it in the **Selected Species** list and click **Remove**.
- To move a bulk species to the bottom of the **Selected Species** list, select the species and click **Last Species**. The transport equation will not be solved for the last species.

See Overview of the Species Dialog Box (p. 2374) for more information.

Selected Solid Species

is a list of all the solid species in the mixture. To add a material to the list, select it in the **Available Materials** list and click the **Add** button below the **Selected Solid Species** list. To remove a material, select it in the **Selected Solid Species** list and click **Remove**. See Overview of the Species Dialog Box (p. 2374) for more information.

Selected Site Species

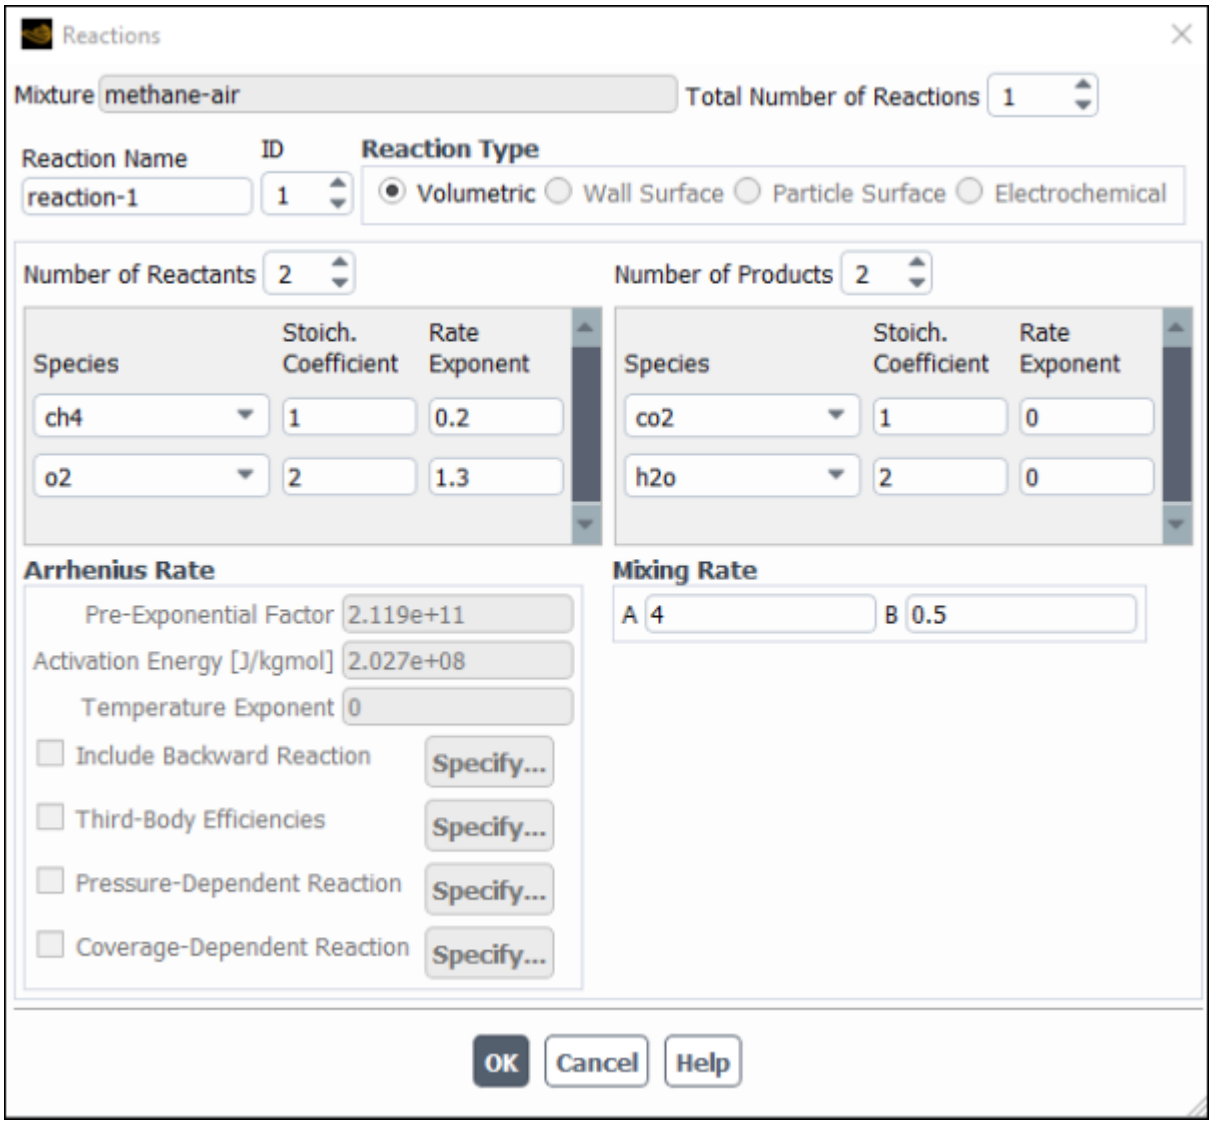
is a list of all the site species in the mixture. To add a material to the list, select it in the **Available Materials** list and click the **Add** button below the **Selected Site Species** list. To remove a material, select it in the **Selected Site Species** list and click **Remove**. See Overview of the Species Dialog Box (p. 2374) for more information.

50.5.29. Reactions Dialog Box

The **Reactions** dialog box (opened by clicking the **Edit...** button next to **Reaction** in the Create/Edit Materials Dialog Box (p. 4833)) allows you to define the reactions for a mixture material. See Defining Reactions (p. 2377) for details about using this dialog box.

(Note that the **Reactions** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mixture

shows the name of the mixture material for which you are defining the species. This field is not editable.

Total Number of Reactions

sets the total number of reactions (fluid-phase reactions and surface reactions occurring at wall boundaries). Use the arrows to change the value, or type in the value and press RETURN.

Reaction Name

contains the name of the reaction.

ID

sets the number of the reaction you want to define. (Again, if you type in the value be sure to press RETURN.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reaction Type

contains options that allow you to specify the type of reaction.

Volumetric

indicates that the current reaction is a volumetric reaction.

Wall Surface

indicates that the current reaction is a wall surface reaction.

Particle Surface

indicates that the current reaction is a particle surface reaction. For reacting multicomponent particles, this option will change to **Particle**.

Electrochemical

indicates that the current reaction is an electrochemical reaction.

Number of Reactants

specifies the number of reactants in the specified reaction.

Species

contains drop-down lists of all species in the mixture. (The number of lists will be equal to the **Number of Reactants**.) Select each reactant in one of these lists.

Stoich. Coefficient

specifies the stoichiometric coefficient of the reactant species in the reaction.

Rate Exponent

specifies the rate constant for the reactant species in the reaction.

Number of Products

indicates the number of products in the specified reaction.

Species

contains drop-down lists of all species in the mixture. (The number of lists will be equal to the **Number of Products**.) Select each product in one of these lists.

Stoich. Coefficient

specifies the stoichiometric coefficient of the product species in the reaction.

Rate Exponent

specifies the rate constant for the product species in the reaction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Arrhenius Rate

contains inputs related to the Arrhenius rate. (If you have chosen **Eddy-Dissipation** for the **Turbulence-Chemistry Interaction** in the Species Model Dialog Box (p. 4716), these inputs are not required.)

Pre-exponential Factor

is the constant A_r in Equation 7.23 in the Theory Guide. The units of A_r must be specified such that the units of the molar reaction rate, $R_{i,r}$ (Equation 7.19 in the Theory Guide, are moles/volume-time (for example, kmol/m^3-s) and the units of the volumetric reaction rate, R_i in Equation 7.19 in the Theory Guide, are mass/volume-time (for example, kg/m^3-s).

Important:

It is important to note that if you have selected the British units system, the Arrhenius factor should still be specified in SI units. This is because Ansys Fluent applies no conversion factor to the value you enter for A_r (the conversion factor is 1.0) when you work in British units, as the correct conversion factor depends on your values for $\nu_{j,r}$, β_r, and so on.

Activation Energy

is the constant E_r in the forward rate constant expression, Equation 7.23 in the Theory Guide).

Temperature Exponent

is the value for the constant β_r in Equation 7.23 in the Theory Guide.

Include Backward Reaction

specifies that the reaction is reversible. By default, the backward reaction rate constant will be computed from Equation 7.23 in the *Fluent Theory Guide*. You can specify your own backward reaction rate parameters in the Backward Reaction Parameters Dialog Box (p. 4884). In this case, the backward reaction rate constant will be computed from Equation 7.28 in the *Fluent Theory Guide*.

Third-Body Efficiencies

allows you to specify and use third-body efficiencies ($\gamma_{j,r}$ in Equation 7.22 in the Theory Guide). These inputs are optional. (This item is available only if you have selected **Volumetric** for the **Reaction Type**.)

Pressure-Dependent Reaction

enables the modeling of a pressure fall-off reaction. See Inputs for Reaction Definition (p. 2377) **Finite-Rate/No TCI** or **Eddy-Dissipation Concept** for the **Turbulence-Chemistry Interaction** in the Species Model Dialog Box (p. 4716) and have selected **Volumetric** for the **Reaction Type**.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Coverage-Dependent Reaction

is used when modeling **Wall Surface** reactions with site-balancing and reaction rates depend on site coverages.

Specify...

opens the Backward Reaction Parameters Dialog Box (p. 4884), Third-Body Efficiency Dialog Box (p. 4884), the Pressure-Dependent Reaction Dialog Box (p. 4885), or Coverage-Dependent Reaction Dialog Box (p. 4888) in which you can specify the backward rate parameters for the reversible reaction, third-body efficiencies, pressure-dependent reaction parameters, or coverage parameters.

Mixing Rate

contains inputs related to the mixing rate. (If you have chosen **Finite-Rate/No TCI** or **Eddy-Dissipation Concept** for the **Turbulence-Chemistry Interaction** in the Species Model Dialog Box (p. 4716), these inputs are not required.)

A

is the constant A in the turbulent mixing rate (Equation 7.39 and Equation 7.40 in the Theory Guide) when it is applied to a species that appears as a reactant in this reaction. The default setting of 4.0 is based on the empirically derived values given by Magnussen and Hjertager [90] (p. 5660).

B

is the constant B in the turbulent mixing rate (Equation 7.40 in the Theory Guide) when it is applied to a species that appears as a product in this reaction. The default setting of 0.5 is based on the empirically derived values given by Magnussen and Hjertager [90] (p. 5660).

Particle Surface Reaction

contains inputs related to a particle surface reaction. For reacting multicomponent particles, this option will change to **Particle Reaction**. For details, see the following sections: .

- User Inputs for Particle Surface Reactions (p. 2405)
- Multicomponent Particles with Chemical Reactions (p. 2407)

This group box appears only if you have selected **Particle Surface** or **Particle** for the **Reaction Type**.

Model

(reacting multicomponent particles only) allows you to select between the **kinetics/diffusion**, **surface-kinetics**, **volume-kinetics**, **phase-change**, and **user-defined** particle reaction model. See Multicomponent Particles with Chemical Reactions (p. 2407) for details.

Diffusion-Limited Species

is a drop-down list that allows you to select the species for which the concentration gradient between the bulk and the particle surface is the largest when there is more than one gaseous

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

reactant taking part in the particle surface reaction. See User Inputs for Particle Surface Reactions (p. 2405) for details.

Diffusion Rate Constant

is the constant $C_{1,r}$ in Equation 7.104 in the Theory Guide.

Effectiveness Factor

is the constant η_r in Equation 7.102 in the Theory Guide.

Butler-Volmer/Tafel Parameters

contains inputs related to an electrochemical reaction. See User Inputs for Electrochemical Reactions (p. 2412) for details. (This group box appears only if **Electrochemical** is selected for **Reaction Type**.)

Tafel Parameters

indicates whether the Bulter-Volmer equation (Equation 7.117 in the *Fluent Theory Guide*) or the Tafel equation (Equation 7.118 in the *Fluent Theory Guide*) is used in the kinetics calculation.

Anodic Transfer Coefficient

is the value of α_a used in Equation 7.117 in the *Fluent Theory Guide*. This item appears if the **Tafel Parameters** check box is cleared.

Cathodic Transfer Coefficient

is the value of α_c used in Equation 7.117 in the *Fluent Theory Guide*. This item appears if the **Tafel Parameters** check box is cleared.

Anodic Tafel Slope

is the value of $\beta_{a,r}$ in Equation 7.118 in the *Fluent Theory Guide*. This item appears only if the **Tafel Parameters** check box is selected.

Cathodic Tafel Slope

is the value of $\beta_{c,r}$ in Equation 7.118 in the *Fluent Theory Guide*. This item appears only if the **Tafel Parameters** check box is selected.

Exchange Current Density

is the value of $i_{o,r}$ used in Equation 7.117 and Equation 7.118 in the *Fluent Theory Guide*.

Reference Temperature

is a value of T_{ref} used in Equation 7.117 and Equation 7.118 in the *Fluent Theory Guide*.

Activation Energy

is a value of E used in Equation 7.117 and Equation 7.118 in the *Fluent Theory Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Equilibrium Potential

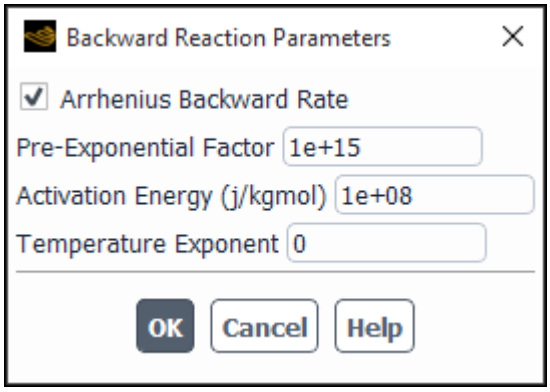
is the value of $E_{eq,r}$ used in Equation 7.119 in the *Fluent Theory Guide*

Specify Reference Molar Concentrations...

opens the Reference Molar Concentrations Dialog Box (p. 4889).

50.5.30. Backward Reaction Parameters Dialog Box

The **Backward Reaction Parameters** dialog box (opened by clicking **Specify...** next to **Include Backward Reaction** in the Reactions Dialog Box (p. 4878)) allows you to specify your custom backward rate parameters for a reversible reaction. See Inputs for Reaction Definition (p. 2377) for details.



Arrhenius Backward Rate

allows you to specify backward rate parameters.

Pre-Exponential Factor

is the constant $A_{b,r}$ in Equation 7.28 in the *Fluent Theory Guide*.

Activation Energy

is the constant $E_{b,r}$ in the backward rate constant expression in Equation 7.28 in the *Fluent Theory Guide*.

Temperature Exponent

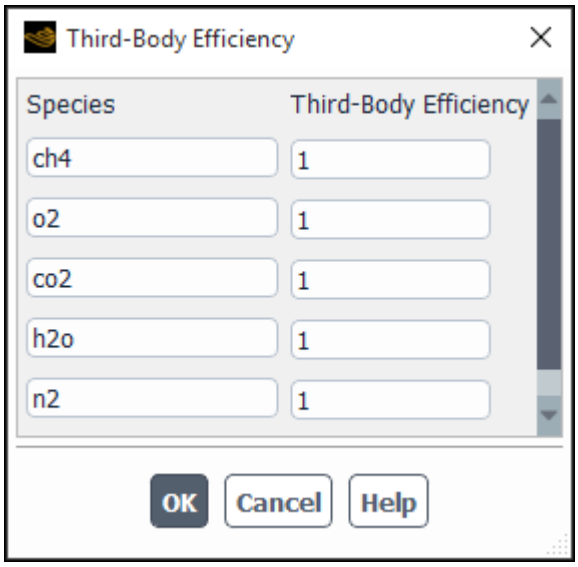
is the constant $\beta_{b,r}$ in Equation 7.28 in the *Fluent Theory Guide*.

50.5.31. Third-Body Efficiency Dialog Box

The **Third-Body Efficiency** dialog box (opened by clicking **Specify...** next to the **Third-Body Efficiencies** button in the Reactions Dialog Box (p. 4878)) allows you to specify the third-body efficiencies for each species in the mixture, to be used in Equation 7.22 in the Theory Guide. See Defining Reactions (p. 2377) for details.

(Note that the **Third-Body Efficiency** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Species

displays the name of each species in the mixture.

Third-body Efficiency

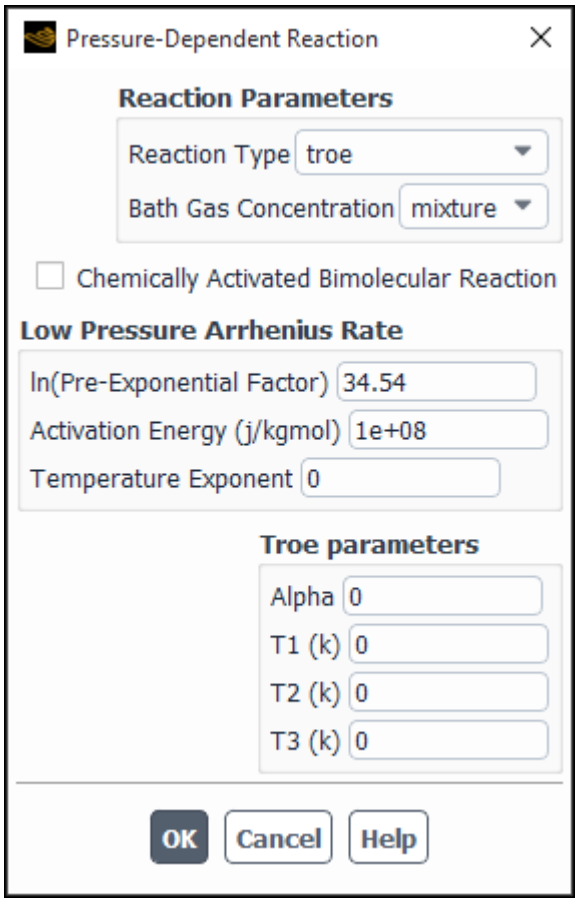
specifies the third-body efficiency for each species.

50.5.32. Pressure-Dependent Reaction Dialog Box

The **Pressure-Dependent Reaction** dialog box (opened by clicking **Specify...** under **Pressure-Dependent Reaction** in the Reactions Dialog Box (p. 4878)) allows you to specify parameters for a pressure fall-off reaction. See Inputs for Reaction Definition (p. 2377) for details.

(Note that the **Pressure-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reaction Parameters

contains inputs for specifying the type of pressure fall-off reaction and the reaction parameters. See Pressure-Dependent Reactions in the Theory Guide for details.

Reaction Type

contains a drop-down list of the available reaction types: **lindemann**, **troe**, and **sri**. See Pressure-Dependent Reactions in the Theory Guide for details.

Bath Gas Concentration

allows you to specify if the bath gas concentration ($[M]$ in Equation 7.32 in the Theory Guide) is to be defined as the concentration of the **mixture**, or as the concentration of one of the mixture's constituent species.

Chemically Activated Bimolecular Reaction

results in a net rate constant at any pressure being defined as Equation 7.38 in the Theory Guide.

Low Pressure Arrhenius Rate

contains inputs for specifying low-pressure Arrhenius parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ln(Pre-exponential Factor)

is the natural logarithm of the constant A_{low} in Equation 7.30 in the Theory Guide. The pre-exponential factor A_{low} is often an extremely large number, so you will enter the natural logarithm of this term.

Activation Energy

is the constant E_{low} in Equation 7.30 in the Theory Guide.

Temperature Exponent

is the constant β_{low} in Equation 7.30 in the Theory Guide.

Troe parameters

contains inputs for specifying parameters for the Troe method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected **troe** as the **Reaction Type**.)

Alpha

is the constant α in Equation 7.35 in the Theory Guide.

T1

is the constant T_1 in Equation 7.35 in the Theory Guide.

T2

is the constant T_2 in Equation 7.35 in the Theory Guide.

T3

is the constant T_3 in Equation 7.35 in the Theory Guide.

SRI Parameters

contains inputs for specifying parameters for the SRI method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected **sri** as the **Reaction Type**.)

a

is the constant a in Equation 7.36 in the Theory Guide.

b

is the constant b in Equation 7.36 in the Theory Guide.

c

is the constant c in Equation 7.36 in the Theory Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

d

is the constant d in Equation 7.36 in the Theory Guide.

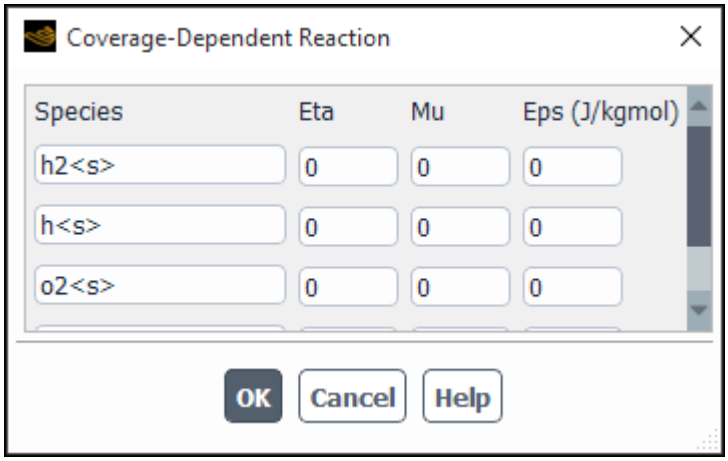
e

is the constant e in Equation 7.36 in the Theory Guide.

50.5.33. Coverage-Dependent Reaction Dialog Box

The **Coverage-Dependent Reaction** dialog box (opened by clicking on **Specify...** under **Coverage-Dependent Reaction** in the Reactions Dialog Box (p. 4878)) allows you to model **Wall Surface** reactions with site-balancing.

(Note that the **Coverage-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Species

are the site species of the reaction.

Eta

is the surface coverage rate modification of the species and is defined in Equation 7.81 in the Theory Guide.

Mu

is the surface coverage rate modification of the species and is defined in Equation 7.81 in the Theory Guide.

Eps

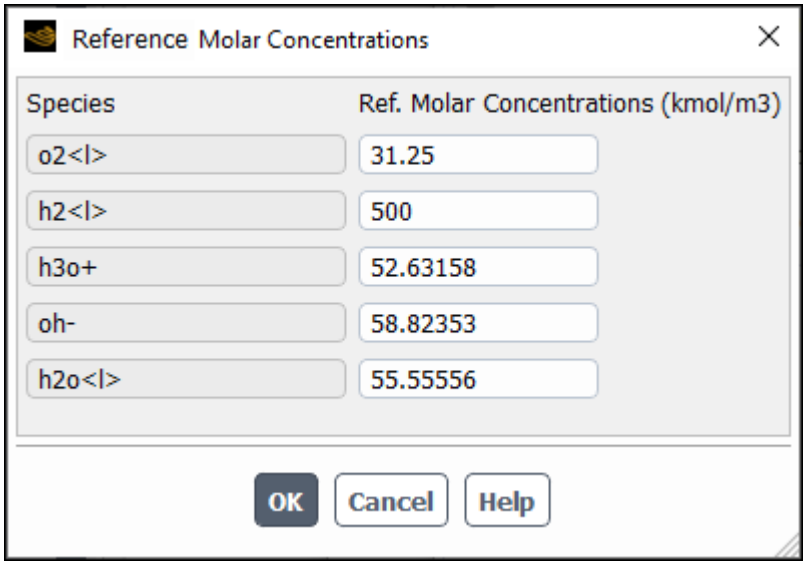
is the surface coverage rate modification of the species and is defined in Equation 7.81 in the Theory Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.5.34. Reference Molar Concentrations Dialog Box

The **Reference Molar Concentrations** dialog box (opened by clicking **Specify Reference Molar Concentrations...** under **Butler-Volmer/Tafel Parameters** in the Reactions Dialog Box (p. 4878)) allows you to specify reference species molar concentrations for the electrochemical reaction.

(Note that the **Reference Molar Concentrations** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Species

are the electrochemical reaction species used in the Butler-Volmer equation (Equation 7.117 in the *Fluent Theory Guide*).

Reference Molar Concentrations

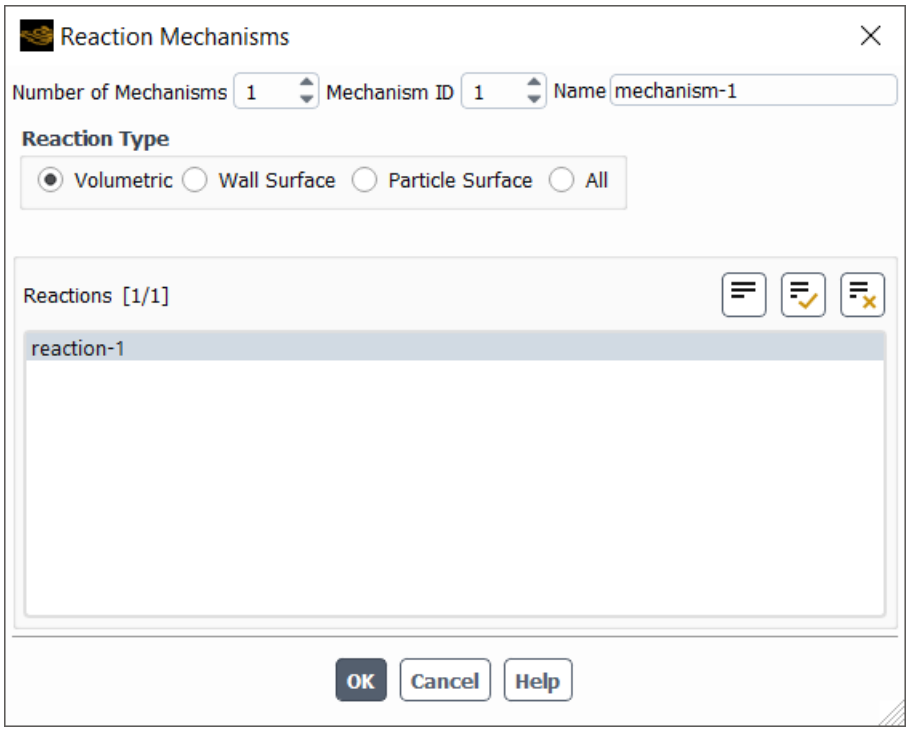
contains inputs for the reference molar concentrations of electrochemical reaction species ($C_{k,r}$ in Equation 7.117).

50.5.35. Reaction Mechanisms Dialog Box

The **Reaction Mechanisms** dialog box (opened by clicking the **Edit...** button next to **Mechanism** in the Create/Edit Materials Dialog Box (p. 4833)) allows you to select the reaction mechanism at a particular zone. See Mixture Materials (p. 2355) for details about these methods and the related inputs.

(Note that the **Reaction Mechanisms** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Number of Mechanisms

specifies the number of mechanisms present.

Mechanism ID

is the ID of the mechanism that you specify.

Name

allows you to enter a name for the mechanism.

Reaction Type

specifies the type of reaction to be displayed for the mechanism.

Volumetric

displays all volumetric reactions under the **Reactions** list.

Wall Surface

displays all wall surface reactions under the **Reactions** list.

Particle Surface

displays all particle surface reactions under the **Reactions** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Electrochemical

displays all electrochemical reactions under the **Reactions** list.

All

displays all types of reactions under the **Reactions** list.

Reactions

displays the list of reactions of the category specified under **Reaction Type**.

Number of Sites

specifies the number of sites at which you can specify the reaction.

Site Name

contains the name of the site.

Site Density

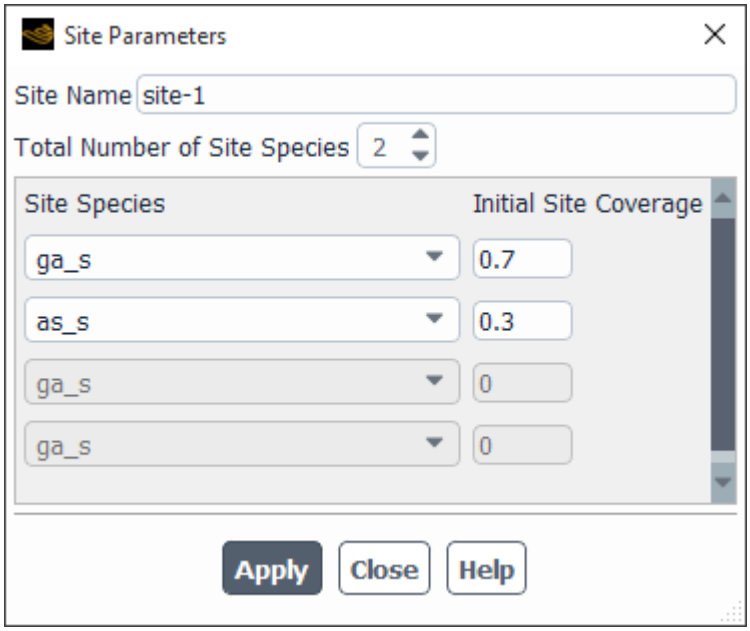
allows you to specify the site density of the species

Define...

opens the Site Parameters Dialog Box (p. 4891).

50.5.36. Site Parameters Dialog Box

The **Site Parameters** dialog box (opened by clicking the **Define...** button next to **Site Density** in the Reaction Mechanisms Dialog Box (p. 4889)) allows you to define the coverage for each site species.



Controls

Site Name

displays the name of site.

Total Number of Site Species

specifies the total number of site species.

Site Species

allows you to select the site species.

Initial Site Coverage

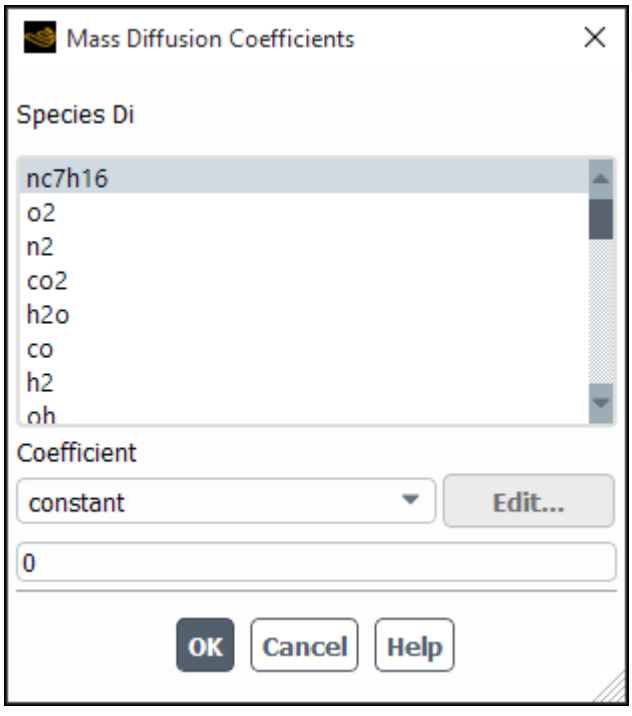
allows you to specify the initial coverage of the site species.

50.5.37. Mass Diffusion Coefficients Dialog Box

The **Mass Diffusion Coefficients** dialog box (opened by clicking the **Edit...** button next to **Mass Diffusivity** in the Create/Edit Materials Dialog Box (p. 4833) allows you to define the diffusion coefficients of the species in the mixture. Its contents will depend on the method you selected for **Mass Diffusivity**. See Mass Diffusion Coefficient Inputs (p. 1643) for details about these methods and the related inputs.

(Note that the **Mass Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

For the **dilute-approx** method:



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

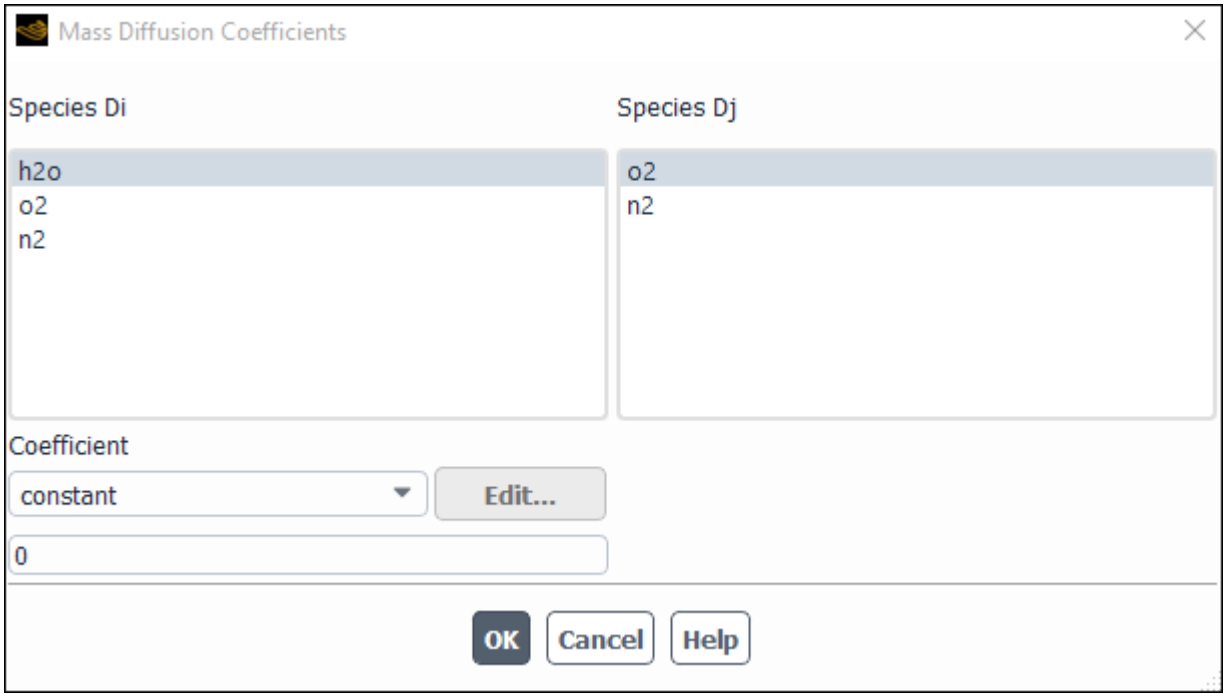
Species Di

contains a selectable list of all species in the mixture, from which you can select each species and specify its diffusion coefficient.

Coefficient

sets the diffusion coefficient for the selected species in the mixture.

For the **multicomponent** method:



Controls

Species Di, Species Dj

contain selectable lists of species in the mixture, from which you can select each pair of species and specify the diffusion coefficient of the selected **Species Di** in the selected **Species Dj**.

Coefficient*

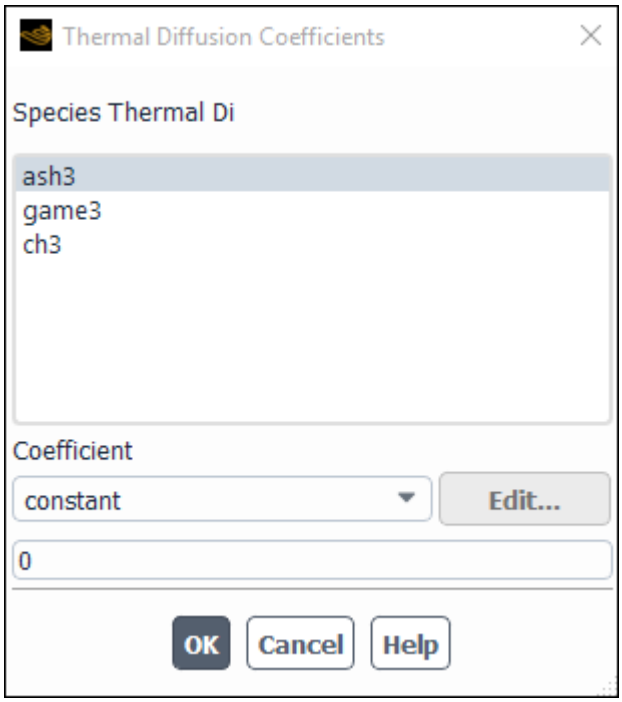
sets the multicomponent diffusion coefficient for **Species Di** in **Species Dj** (which is equivalent to the diffusion coefficient for **Species Dj** in **Species Di**).

50.5.38. Thermal Diffusion Coefficients Dialog Box

The **Thermal Diffusion Coefficients** dialog box (opened by clicking the **Edit...** button next to **Thermal Diffusion Coefficient** in the Create/Edit Materials Dialog Box (p. 4833) allows you to define the thermal diffusion coefficients of the species in the mixture. See Thermal Diffusion Coefficient Inputs (p. 1648) for details about these methods and the related inputs.

(Note that the **Thermal Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Species Thermal Di

contains a selectable list of all species in the mixture, from which you can select each species and specify its thermal diffusion coefficient.

Coefficient

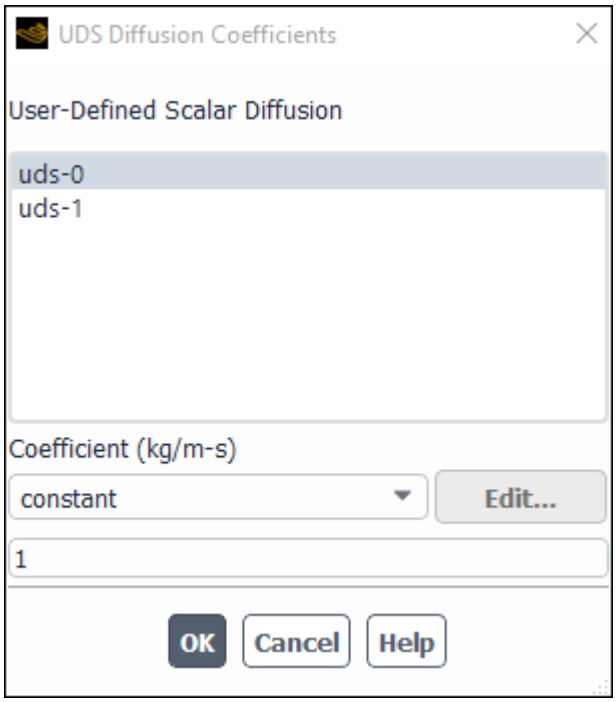
sets the thermal diffusion coefficient for the selected species in the mixture.

50.5.39. UDS Diffusion Coefficients Dialog Box

The **UDS Diffusion Coefficients** dialog box (opened by selecting **uds** and clicking the **Edit...** button next to **UDS Diffusivity** in the Create/Edit Materials Dialog Box (p. 4833)) allows you to define the diffusion coefficients for your user-defined scalar transport equations.

(Note that the **UDS Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

User-Defined Scalar Diffusion

contains a selectable list of all user-defined scalars, from which you can select each one and specify its diffusion coefficient.

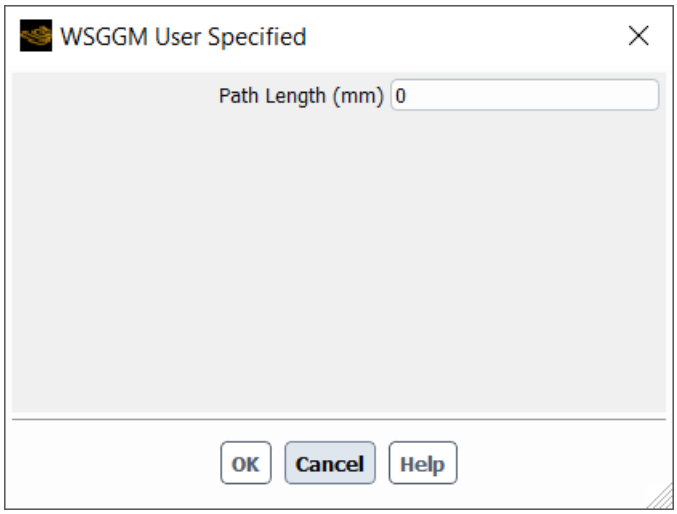
Coefficient

sets the diffusion coefficient for the selected user-defined scalar.

50.5.40. WSGGM User Specified Dialog Box

The **WSGGM User Specified** dialog box opens when you select **wsggm-user-specified** as the input method for a composition-dependent **Absorption Coefficient** in the Create/Edit Materials Dialog Box (p. 4833) and it allows you to define the path length for he weighted-sum-of-gray-gases model. See Inputs for a Composition-Dependent Absorption Coefficient (p. 1640) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



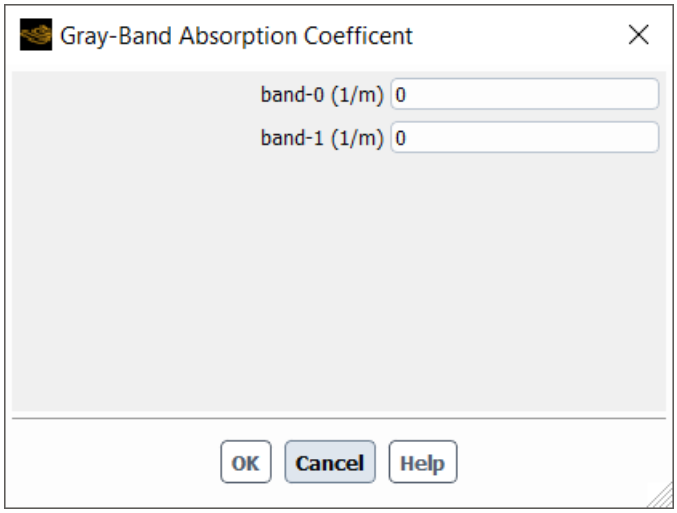
Controls

Path Length

allows you to set the **Path Length** equal to a mean beam length that you have calculated outside of Fluent.

50.5.41. Gray-Band Absorption Coefficient Dialog Box

The **Gray-Band Absorption Coefficient** allows you to specify a different absorption coefficient in each gray band when you are modeling non-gray radiation with the P-1, DO, or MC models (see The P-1 Model Equations, The DO Model Equations, or Monte Carlo (MC) Radiation Model Theory in the Theory Guide and Setting Up the P-1 Model with Non-Gray Radiation (p. 2158), Defining Non-Gray Radiation for the DO Model (p. 2176), or Setting Up the MC Model (p. 2178)). This dialog box will open when you select **gray-band** in the drop-down list next to **Absorption Coefficient** in the Create/Edit Materials Dialog Box (p. 4833).



Controls

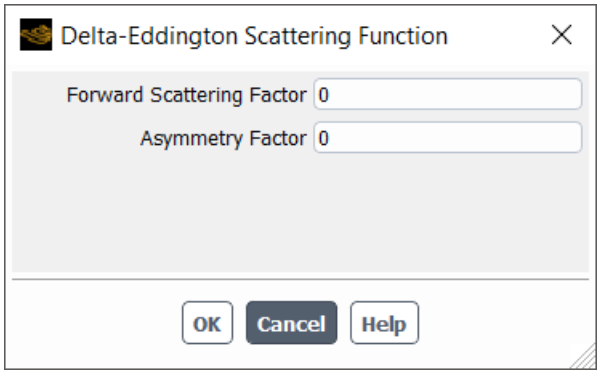
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

band n

specifies the absorption coefficient for the n^{th} gray band.

50.5.42. Delta-Eddington Scattering Function Dialog Box

The **Delta-Eddington Scattering Function** dialog box allows you to define the parameters used in the Delta-Eddington phase function for radiation scattering. This dialog box will open when you select **delta-eddington** in the drop-down list next to **Scattering Phase Function** in the Create/Edit Materials Dialog Box (p. 4833). See Anisotropic Scattering for details about the items below.



Controls

Forward Scattering Factor

specifies the value of f in Equation 5.107 in the Theory Guide.

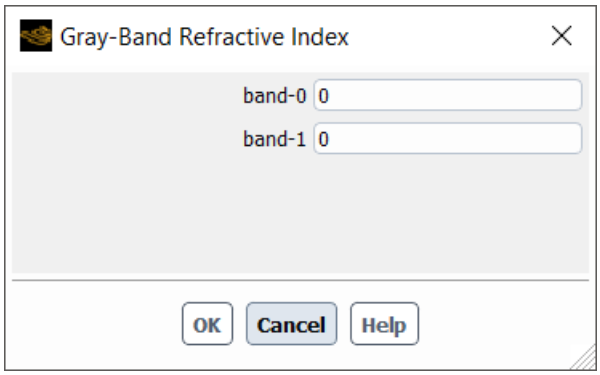
Asymmetry Factor

specifies the value of C in Equation 5.107 in the Theory Guide.

50.5.43. Gray-Band Refractive Index Dialog Box

The **Gray-Band Refractive Index** allows you to specify a different refractive index in each gray band when you are modeling non-gray radiation with the P-1, DO, or MC model (see The P-1 Model Equations, The DO Model Equations, or Monte Carlo (MC) Radiation Model Theory in the Theory Guide and Setting Up the P-1 Model with Non-Gray Radiation (p. 2158), Defining Non-Gray Radiation for the DO Model (p. 2176), or Setting Up the MC Model (p. 2178)). This dialog box will open when you select **refractive-band** in the drop-down list next to **Refractive Index** in the Create/Edit Materials Dialog Box (p. 4833).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

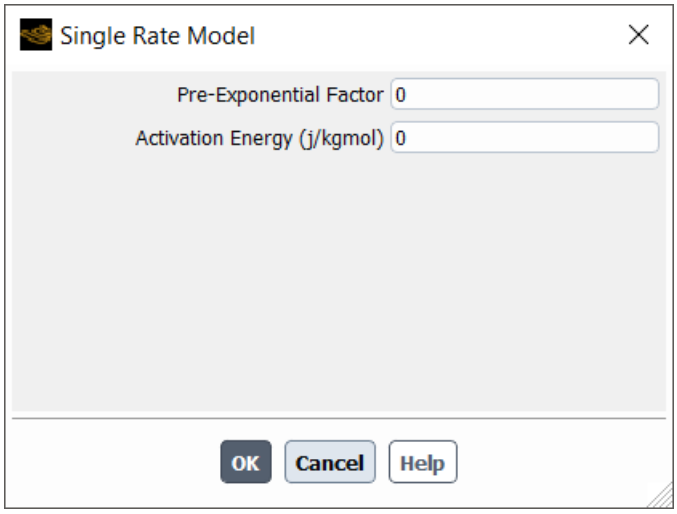
Band n

specifies the refractive index for the n^{th} gray band.

50.5.44. Single Rate Model Dialog Box

The **Single Rate Model** dialog box (which opens when you select **single-rate** from either the **Devolatilization** or **Themolysis Model** drop-down list in the Create/Edit Materials Dialog Box (p. 4833)) allows you to specify the parameters used in either the single kinetic rate devolatilization model or single kinetic rate Thermolysis model. For more details about these models, see Devolatilization (Law 4) and Mass Transfer During Law 2—Thermolysis in the *Fluent Theory Guide*, respectively.

Note that the **Single Rate Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Pre-exponential Factor

sets the value of:

- Devolatilization model: A_1 in Equation 12.109 in the Theory Guide for the computation of the kinetic rate.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Thermolysis model: A in Equation 12.87 (for droplet particles) or A_i in Equation 12.164 in the *Fluent Theory Guide* (for multicomponent particles).

Activation Energy

sets the value of

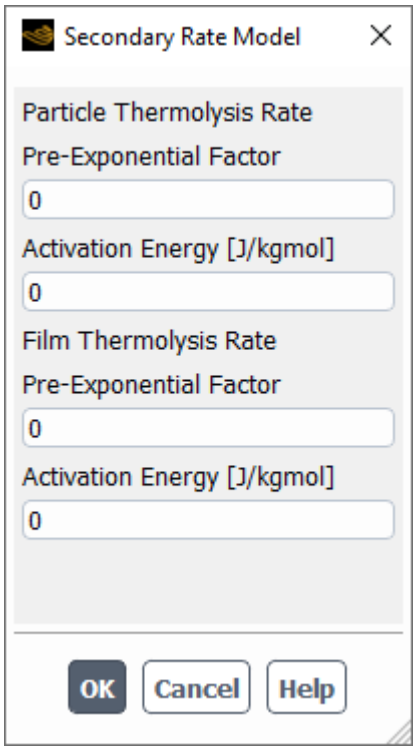
- Devolatilization model: E in Equation 12.109 in the Theory Guide for the computation of the kinetic rate.
- Thermolysis model: E in Equation 12.87 (for droplet particles) or E_i in Equation 12.164 in the *Fluent Theory Guide* (for multicomponent particles).

50.5.45. Secondary Rate Model Dialog Box

The **Secondary Rate Model** dialog box (which opens when you select **secondary-rate** from the **Themolysis Model** drop-down list in the Create/Edit Materials Dialog Box (p. 4833)) allows you to specify the parameters used in the Thermolysis model to calculate either the mass transfer rate from the free particle and the film to the bulk gas phase (for a droplet material) or the vaporization rate of the free particle and the film (for multicomponent material). For more information, see Mass Transfer During Law 2—Thermolysis and Multicomponent Particle Definition (Law 7) in the *Fluent Theory Guide*.

This dialog box is available only when the Lagrangian wall film is used.

Note that the **Secondary Rate Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Particle Thermolysis Rate

is where entries for calculating the particle thermolysis rate can be set.

Pre-exponential Factor

sets the value of $A_{particle}$ to be used in either Equation 12.87 in the *Fluent Theory Guide* for a droplet material or Equation 12.164 in the *Fluent Theory Guide* for a multicomponent material.

Activation Energy

sets the value of $E_{particle}$ to be used in either Equation 12.87 in the *Fluent Theory Guide* for a droplet material or Equation 12.164 in the *Fluent Theory Guide* for a multicomponent material.

Film Thermolysis Rate

is where entries for calculating the film thermolysis rate can be set.

Pre-exponential Factor

sets the value of A_{film} to be used in either Equation 12.87 in the *Fluent Theory Guide* for a droplet material or Equation 12.164 in the *Fluent Theory Guide* for a multicomponent material.

Activation Energy

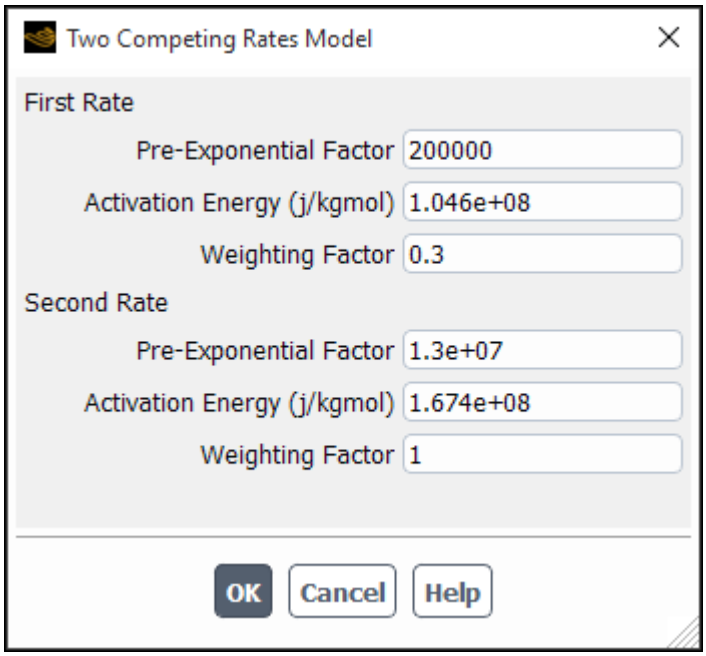
sets the value of E_{film} to be used in either Equation 12.87 in the *Fluent Theory Guide* for a droplet material or Equation 12.164 in the *Fluent Theory Guide* for a multicomponent material.

50.5.46. Two Competing Rates Model Dialog Box

The **Two Competing Rates Model** dialog box (which opens when you select **two-competing-rates** as the **Devolatilization Model** in the Create/Edit Materials Dialog Box (p. 4833) allows you to specify the parameters used for each of the competing rates in the two-competing-rates devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the **Two Competing Rates Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

First Rate

sets parameters for the first of the two rates.

Pre-exponential Factor

sets the value of A_1 in Equation 12.111 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

sets the value of E_1 in Equation 12.111 in the Theory Guide for the computation of the kinetic rate.

Weighting Factor

sets the value of α_1 in Equation 12.113 in the Theory Guide.

Second Rate

sets parameters for the second of the two rates.

Pre-exponential Factor

sets the value of A_2 in Equation 12.112 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

sets the value of E_2 in Equation 12.112 in the Theory Guide for the computation of the kinetic rate.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

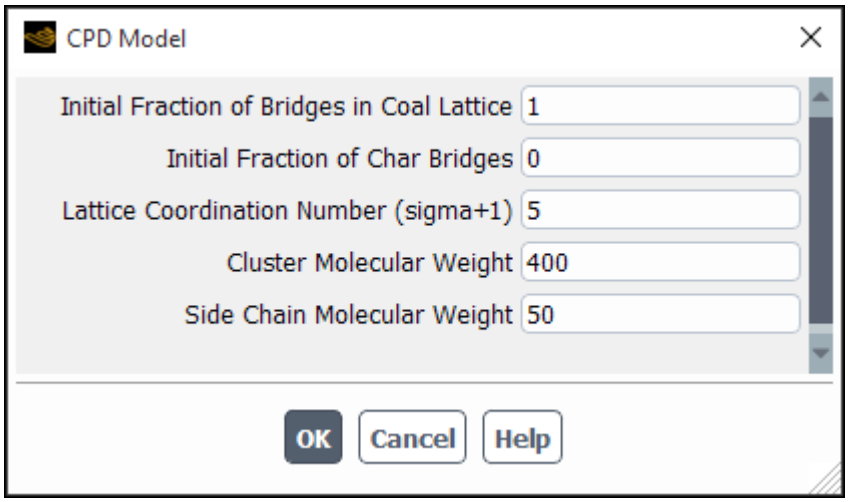
Weighting Factor

sets the value of α_2 in Equation 12.113 in the Theory Guide.

50.5.47. CPD Model Dialog Box

The **CPD Model** dialog box (which opens when you select **cpd-model** as the **Devolatilization Model** in the Create/Edit Materials Dialog Box (p. 4833)) allows you to specify the parameters used in the CPD devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the **CPD Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Initial Fraction of Bridges in Coal Lattice

sets the value of p_0 in Equation 12.124 in the Theory Guide.

Initial Fraction of Char Bridges

sets the value of c_0 in Equation 12.123 in the Theory Guide.

Lattice Coordination Number

sets the value of $\sigma+1$ in Equation 12.135 in the Theory Guide.

Cluster Molecular Weight

sets the value of $M_{w,1}$ in Equation 12.135 in the Theory Guide.

Side Chain Molecular Weight

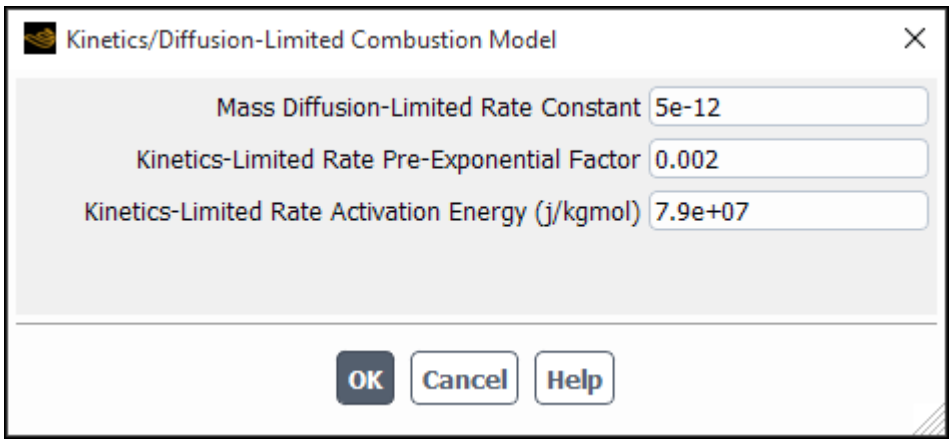
sets the value of $M_{w,\delta}$ in Equation 12.134 in the Theory Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.5.48. Kinetics/Diffusion-Limited Combustion Model Dialog Box

The **Kinetics/Diffusion-Limited Combustion Model** dialog box (which opens when you select **kinetics/diffusion-limited** as the **Combustion Model** in the Create/Edit Materials Dialog Box (p. 4833) allows you to specify the parameters used for the kinetics/diffusion-limited rate surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the **Kinetics/Diffusion-Limited Combustion Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Mass Diffusion-Limited Rate Constant

sets the value for C_1 in Equation 12.147 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor

sets the value for C_2 in Equation 12.148 in the Theory Guide.

Kinetics-Limited Rate Activation Energy

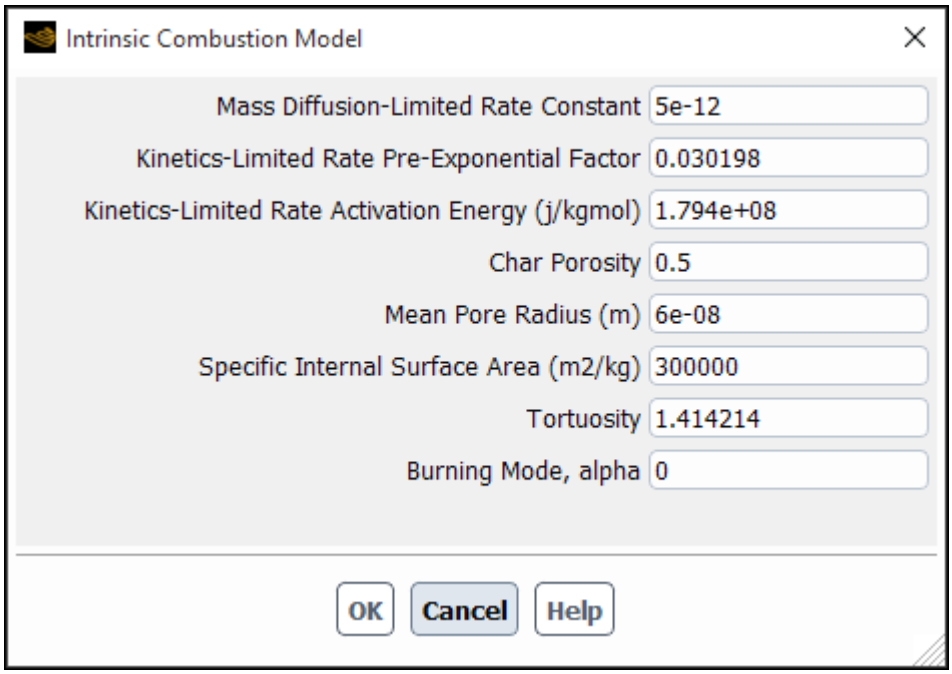
sets the value for E in Equation 12.148 in the Theory Guide.

50.5.49. Intrinsic Combustion Model Dialog Box

The **Intrinsic Combustion Model** dialog box (which opens when you select **intrinsic-model** as the **Combustion Model** in the Create/Edit Materials Dialog Box (p. 4833) allows you to specify the parameters used for the intrinsic surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the **Intrinsic Combustion Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mass Diffusion-Limited Rate Constant

sets the value for C_1 in Equation 12.147 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor

sets the value for A_i in Equation 12.157 in the Theory Guide.

Kinetics-Limited Rate Activation Energy

sets the value for E_i in Equation 12.157 in the Theory Guide.

Char Porosity

sets the value for θ in Equation 12.154 in the Theory Guide.

Mean Pore Radius

sets the value for $\overline{r}_p$ in Equation 12.156 in the Theory Guide.

Specific Internal Surface Area

sets the value for A_g in Equation 12.151 and Equation 12.153 in the Theory Guide.

Tortuosity

sets the value for τ in Equation 12.154 in the Theory Guide.

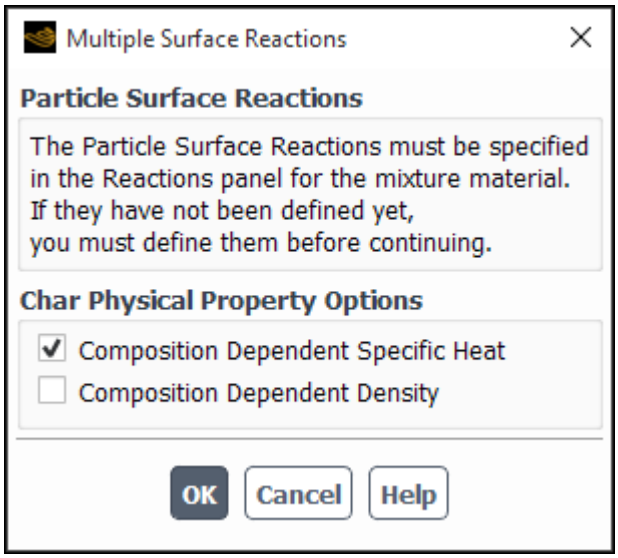
Burning Mode, alpha

sets the value for α in Equation 12.158 in the Theory Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.5.50. Multiple Surface Reactions Dialog Box

The **Multiple Surface Reactions** dialog box (which opens when you select **multiple-surface-reactions** as the **Combustion Model** in the Create/Edit Materials Dialog Box (p. 4833)) allows you to enable composition-dependent char properties when using the multiple surface reactions combustion model.



Controls

Composition Dependent Specific Heat

enables calculation of the char specific heat from the particle specific heat values. See **Combustion Model** (p. 2815) for details.

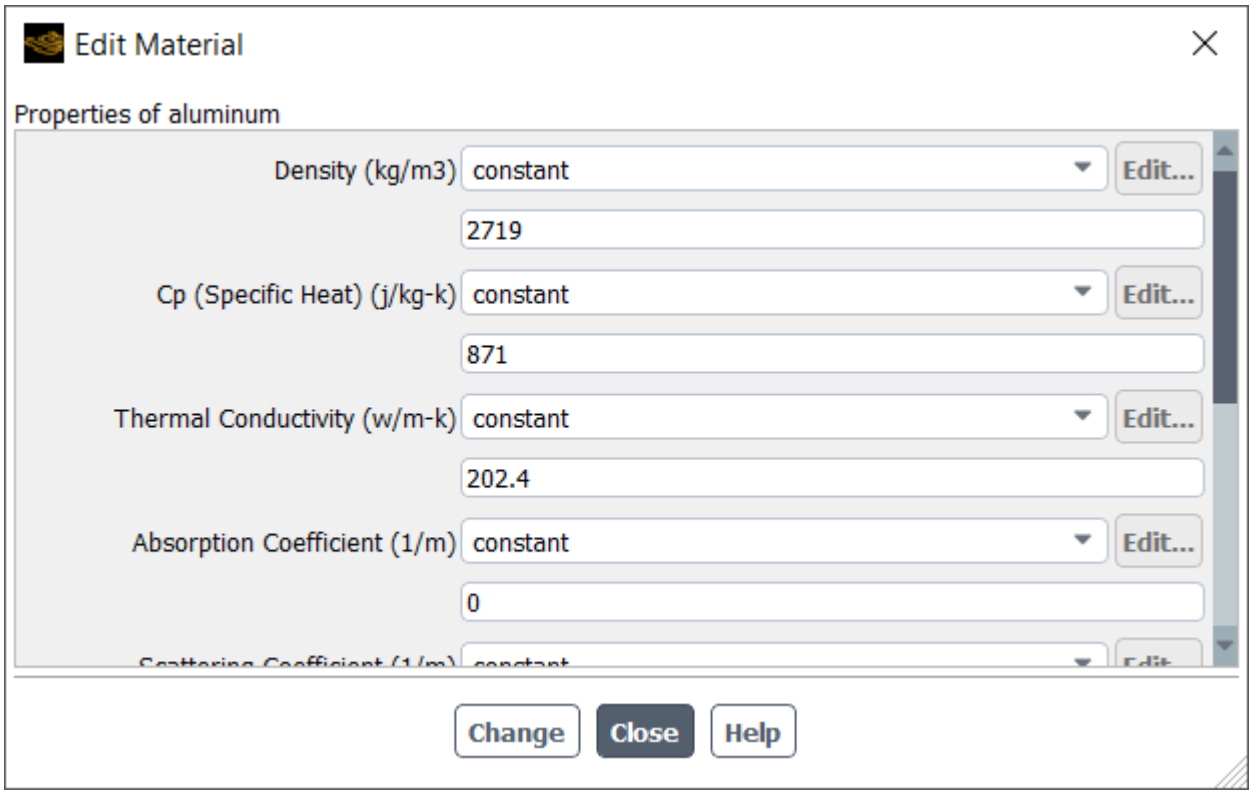
Composition Dependent Density

enables calculation of the char density from the particle density values. See **Combustion Model** (p. 2815) for details.

50.5.51. Edit Material Dialog Box

The **Edit Material** dialog box contains the portion of the Create/Edit Materials Dialog Box (p. 4833) that contains the properties for a specific material. It is opened from the Multiphase Model Dialog Box (p. 4648) (**Phases** tab), Wall Dialog Box (p. 5031), Fluid Dialog Box (p. 4909), or Solid Dialog Box (p. 4921).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Properties of material-n

contains a list of the properties of material-*n*. The items in the list are the same as those in the Create/Edit Materials Dialog Box (p. 4833).

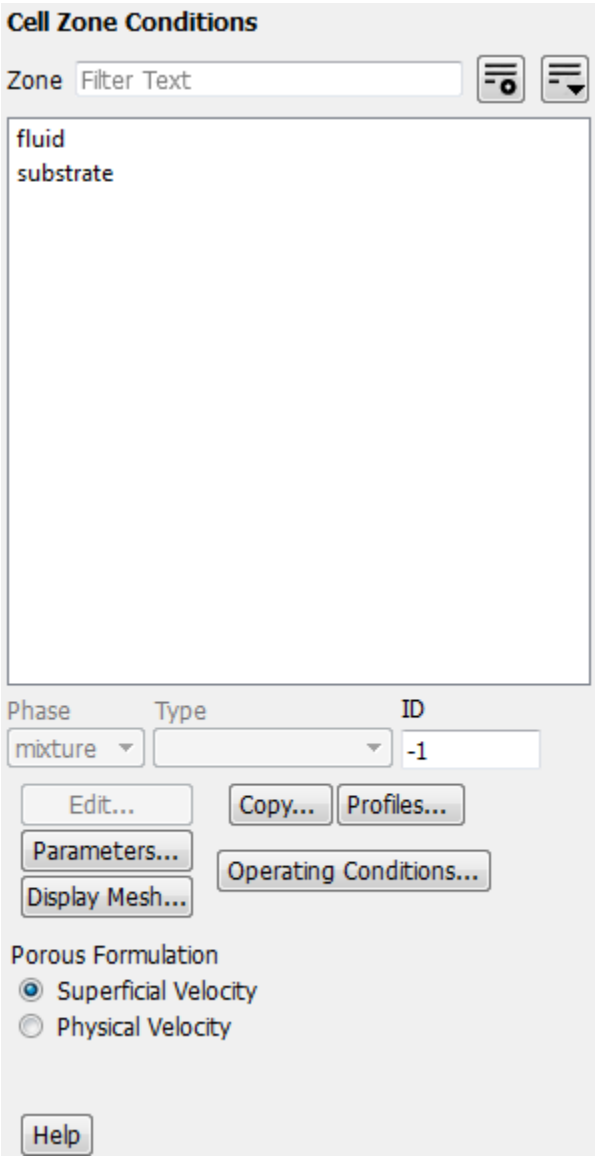
Change

applies any changes you have made to the properties of the material.

50.6. Cell Zone Conditions Task Page

The **Cell Zones Conditions** task page allows you to set the type of a cell zone and display other dialog boxes to set the cell zone condition parameters for each zone. See Cell Zone Conditions (p. 1298) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone

contains a selectable list of available cell zones from which you can select the zone of interest. You can check a zone type by using the mouse probe (see Controlling the Mouse Button Functions (p. 3989)) on the displayed physical mesh. This feature is particularly useful if you are setting up a problem for the first time, or if you have two or more cell zones of the same type and you want to determine the cell zone IDs. To do this you must first display the mesh with the Mesh Display Dialog Box (p. 4636). Then click the boundary zone with the right (select) mouse button. Ansys Fluent will print the cell zone ID and type of that boundary zone in the console window.

Phase

specifies the phase for which conditions at the selected cell **Zone** are being set. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type

contains a drop-down list of condition types for the selected cell zone. The list contains all possible types to which the cell zone can be changed.

ID

displays the cell zone ID number of the selected cell zone. (This is for informational purposes only; you cannot edit this number.)

Edit...

opens the Fluid Dialog Box (p. 4909) or Solid Dialog Box (p. 4921).

Copy...

opens the Copy Conditions Dialog Box (p. 4925), which allows you to copy conditions from one cell zone to other cell zones of the same type. See Copying Cell Zone and Boundary Conditions (p. 1283) for details.

Profiles...

opens the Profiles Dialog Box (p. 4929).

Parameters...

opens the Parameters Dialog Box (p. 5284).

Operating Conditions...

opens the Operating Conditions Dialog Box (p. 4926).

Display Mesh...

opens the Mesh Display Dialog Box (p. 4636).

Porous Formulation

contains options for setting the velocity in the porous medium simulation. See Defining the Porous Velocity Formulation (p. 1322) for details.

Superficial Velocity

enables the superficial velocity in a porous medium simulation. This is the default method.

Physical Velocity

enables the physical velocity in a porous medium simulation for a more accurate simulation. This option is available only for a pressure-based solver. See Modeling Porous Media Based on Physical Velocity (p. 1317) for details.

For additional information, see the following sections:

50.6.1. Fluid Dialog Box

50.6.2. Solid Dialog Box

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

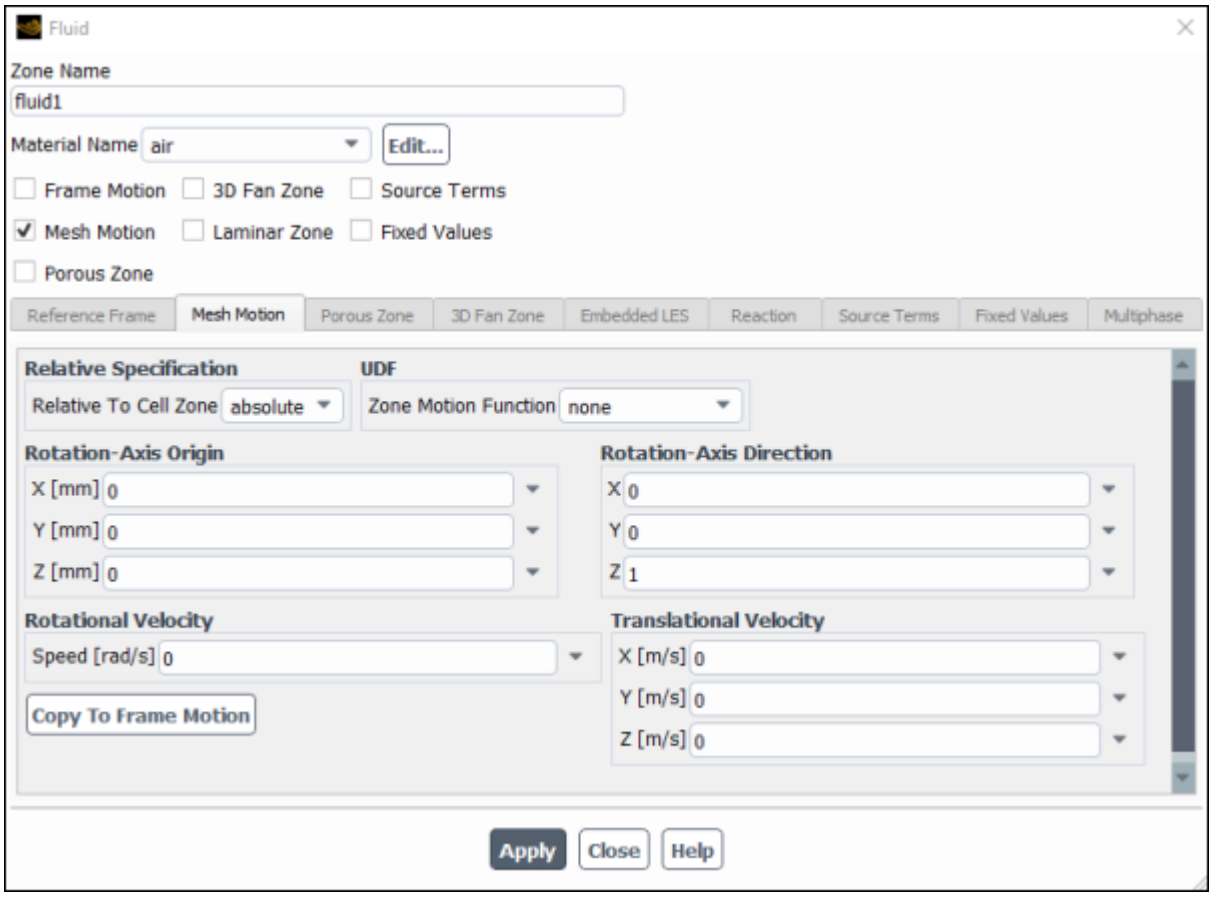
50.6.3. Copy Conditions Dialog Box
50.6.4. Operating Conditions Dialog Box
50.6.5. Select Input Parameter Dialog Box
50.6.6. Profiles Dialog Box
50.6.7. Replicate Profile Dialog Box
50.6.8. Orient Profile Dialog Box
50.6.9. Write Profile Dialog Box

50.6.1. Fluid Dialog Box

The **Fluid** dialog box sets the conditions for a fluid cell zone. It is opened from the Cell Zone Conditions Task Page (p. 4906). See Inputs for Fluid Zones (p. 1299) and User Inputs for Porous Media (p. 1320) for details about the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Material Name

sets the fluid material. The drop-down list contains the names of all materials that have been loaded into the solver. Materials are defined with the Materials Task Page (p. 4831).

Important:

If you are modeling species transport or multiphase flow, the **Material Name** list will not appear in the **Fluid** dialog box. For species calculations, the mixture material for all fluid zones will be the material you specified in the Species Model Dialog Box (p. 4716). For multiphase flows, the materials are specified when you define the phases, as described in Defining the Phases for the VOF Model (p. 3005).

Phase

(multiphase models only) specifies the phase for which conditions at the selected fluid cell zone are being set.

Frame Motion

enables the moving reference frame model for the cell zone. See Specifying the Rotation Axis (p. 1301) and Defining Zone Motion (p. 1301) for details.

Mesh Motion

enables the sliding mesh model for the cell zone. See Setting Up the Sliding Mesh Problem (p. 1773) for details.

Porous Zone

indicates that the zone is a porous medium. Additional items will appear in the dialog box when this option is enabled. See User Inputs for Porous Media (p. 1320) for details.

3D Fan Zone

allows you to simulate the effect of an axial fan by applying a distributed momentum source in a toroid-shaped fluid volume. This model can calculate not only the axial velocity, but the swirl and radial velocities as well. When you enable this option, the **3D Fan Zone** tab becomes available, so that you can specify the geometry and properties of the fan. The cell zone should have a toroid shape that is sized to match the blade-swept volume of the fan you are simulating (that is, has an inner and outer radius that matches the radius of the fan's hub and blade tips, respectively, as well as a length that matches the thickness of the toroid region swept by the blades in the axial direction). Furthermore, the fluid cell zone should be "interior", that is, have at least two boundary zones of type **interior** that border another fluid cell zone and act as the fan inlet and outlet (the other boundaries can be of type **interior** as well). See 3D Fan Zones (p. 1350) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Laminar Zone

disables the calculation of turbulence production in the fluid zone (appears only for turbulent flow calculations using the Spalart-Allmaras model or one of the k- ε or k- ω models). See Specifying a Laminar Zone (p. 1300) for details.

LES Zone

allows you to model a smaller embedded LES zone within a larger URANS computational domain for turbulent flow calculations. When you turn on this option, the **Embedded LES** tab will be enabled to allow you to specify properties for the embedded LES zone. See Setting Up the Embedded Large Eddy Simulation (ELES) Model (p. 2088) for details.

Source Terms

enables the specification of volumetric sources of mass, momentum, energy, and so on. When you turn on this option, the **Source Terms** tab will be enabled to allow you to specify the values for the desired sources. See Defining Mass, Momentum, Energy, and Other Sources (p. 1360) for details.

Fixed Values

enables the fixing of the value of one or more variables in the fluid zone, rather than computing them during the calculation. See Fixing the Values of Variables (p. 1355) for details.

Important:

You can fix values for velocity components, temperature, and species mass fractions only if you are using the pressure-based solver.

Participates In Radiation

specifies whether or not the fluid zone participates in radiation. This option appears when you are using the DO model for radiation.

Warning:

In general, disabling **Participates in Radiation** for fluid zones is not recommended, as it can produce erroneous results. There are rare cases when it is acceptable: for example, if the domain contains multiple fluid zones, disabling this option for zones where radiation is negligible may save computational time without affecting the results.

Reaction

enables/disables reactions in the porous zone.

Electrolyte

indicates that the zone is an electrolyte zone. By default, all fluid zones are assumed to be electrolyte zones. This option appears when the **Electrochemical** Reaction model is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Frame Tab

lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin

specifies the origin for the axis of rotation of the fluid zone. See Specifying the Rotation Axis (p. 1301) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction

specifies the direction vector for the fluid zone's axis of rotation. See Specifying the Rotation Axis (p. 1301) for details. This item will appear only for 3D models.

Rotational Velocity

contains an input field for the rotational **Speed** of the zone.

Translational Velocity

contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification

indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF

allows you to hook the `DEFINE_ZONE_MOTION` user-defined function.

Copy to Mesh Motion

allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the `DEFINE_ZONE_MOTION` user-defined function, will be copied from one model to the other.

Mesh Motion Tab

lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin

specifies the origin for the axis of rotation of the fluid zone. See Specifying the Rotation Axis (p. 1301) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction

specifies the direction vector for the fluid zone's axis of rotation. See Specifying the Rotation Axis (p. 1301) for details. This item will appear only for 3D models.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotational Velocity

contains an input field for the rotational **Speed** of the zone.

Translational Velocity

contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification

indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF

allows you to hook the `DEFINE_ZONE_MOTION` user-defined function.

Copy to Frame Motion

allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the `DEFINE_ZONE_MOTION` user-defined function, will be copied from one model to the other.

Porous Zone Tab

lists the parameters associated with the porous zone.

Conical

enables the specification of a conical (or cylindrical) porous medium. This item will appear only when the **Porous Zone** option is enabled for a 3D case.

Cone Half Angle

specifies the angle between the cone's axis and its surface (see Figure 7.23: Cone Half Angle (p. 1326)). Set this to 0 to define the porous region using a cylindrical coordinate system. This item will appear only when the **Porous Zone** and **Conical** options are enabled.

Snap to Zone

aligns the plane (or line, in 2D) tool with the zone selected in the drop-down list. The tool is centered at the centroid of the zone, with the tool's axis normal to the zone. If this axis is not the desired cone axis, reposition the tool (as described in Using the Plane Tool (p. 3813)). When you are satisfied with the axis, click the **Update From Plane Tool** (or **Update From Line Tool**) button to update the **Cone Axis Vector** fields.

This item will appear only when the **Porous Zone** and **Conical** options are enabled.

Update From Plane Tool

(**Update From Line Tool** in 2D) updates the **Direction-1 Vector** and (in 3D) the **Direction-2 Vector** from the plane tool orientation. If the **Conical** option is enabled, this button will update the **Cone Axis Vector** and the **Point on Cone Axis**. See Defining the Viscous and Inertial

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Resistance Coefficients (p. 1324) for details. This item will appear only when the **Porous Zone** option is enabled.

Direction-1 Vector, Direction-2 Vector

indicate the directions for which the resistance coefficients are defined. See Defining the Viscous and Inertial Resistance Coefficients (p. 1324) for details. These items will appear only when the **Porous Zone** option is enabled, but the **Conical** option is not. (In 2D, only **Direction-1 Vector** will appear.)

Cone Axis Vector

specifies the **X,Y,Z** vector for the cone's axis.

This item will appear only when the **Porous Zone** and **Conical** options are enabled.

Point on Cone Axis

specifies a point on the cone's axis. This point will be used by Ansys Fluent to transform the resistances to the Cartesian coordinate system.

This item will appear only when the **Porous Zone** and **Conical** options are enabled.

Relative Velocity Resistance Formulation

allows Ansys Fluent to either apply the relative reference frame or the absolute reference frame. This allows for the correct prediction of the source terms.

Viscous Resistance, Inertial Resistance

contain inputs for the viscous resistance coefficient $1/\alpha$ and the inertial resistance coefficient $C2$ in each direction. See Defining the Viscous and Inertial Resistance Coefficients (p. 1324) for details. These items will appear only when the **Porous Zone** option is enabled.

Alternative Formulation

provides better stability to the calculation when your porous medium is anisotropic.

If you have enabled the **Conical** option, **Direction-1** is the cone axis direction, **Direction-2** is the normal to the cone surface (radial (r) direction for a cylinder), and **Direction-3** is the circumferential (θ) direction.

Power Law Model

contains inputs for the **C0** and **C1** coefficients in the power law model for porous media. See Using the Power-Law Model (p. 1332) for details.

Relative Permeability

(Eulerian multiphase model only) is a group box where you can set relative permeability for the mixture. See Specifying the Relative Permeability (p. 1336) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Capillary Pressure

(Eulerian multiphase model only) is a group box where you can set a model for capillary pressure for the mixture. See Capillary Pressure Usage (p. 1345) for details.

Relative Viscosity

is a group box where you can specify a model for relative viscosity. See Specifying the Relative Viscosity (p. 1336) for details.

Fluid Porosity

contains an additional input for the porous medium. See User Inputs for Porous Media (p. 1320) for details.

Porosity

sets the volume fraction of fluid within the porous region.

Heat Transfer Settings

contains heat transfer settings for the porous medium. See Specifying the Heat Transfer Settings (p. 1332) for details.

Thermal Model

specifies whether or not thermal equilibrium is assumed between the medium and the fluid flow.

Equilibrium

specifies that the medium and the fluid flow are in thermal equilibrium in the porous medium.

Non-Equilibrium

specifies that the medium and the fluid flow are not in thermal equilibrium in the porous medium, so that a dual cell approach is enabled.

Solid Material Name

specifies the solid material in the porous region. This drop-down menu is only available when **Equilibrium** is selected from the **Thermal Model** list.

Solid Zone

displays the name of the solid cell zone that is coupled with the porous fluid zone through heat transfer. This field is only displayed when **Non-Equilibrium** is selected from the **Thermal Model** list.

Interfacial Area Density

specifies A_{fs} (as described in Non-Equilibrium Thermal Model Equations (p. 1316)) for the porous region. This text-entry box is only available when **Non-Equilibrium** is selected from the **Thermal Model** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Heat Transfer Coefficient

specifies h_{fs} (as described in Non-Equilibrium Thermal Model Equations (p. 1316)) for the porous region. This text-entry box is only available when **Non-Equilibrium** is selected from the **Thermal Model** list.

Anisotropic Species Diffusion

allows you to model anisotropic species diffusion in porous media. When this option is selected, you can specify the **Matrix Components** for the anisotropic diffusion matrix in the porous zone. This option is available only with the species transport models.

3D Fan Zone Tab

provides the settings that define a 3D fan zone. See 3D Fan Zones (p. 1350) for details.

Geometry

allows you to define the location and size of the fan.

Inlet Fan Zone

allows you to select a boundary zone of type **interior** that will act as the surface on which the fan will be located.

Hub Radius

defines the radius of the fan hub, that is, the inner radius of the blade-swept volume on which the fan's distributed momentum sources are applied.

Tip Radius

defines the radius of the blade tips of the fan, that is, the outer radius of the blade-swept volume on which the fan's distributed momentum sources are applied.

Thickness

defines the thickness of the toroid region swept by the blades in the axial direction.

Inflection Point

is a ratio that defines the fraction of the fan blade length (starting at the hub) over which the tangential velocity of the fan discharge is increasing with increasing radius and peaks, before tapering off (see Figure 7.30: The Inflection Point Ratio of a Pitched Blade Turbine (p. 1354)).

Fan Origin

defines the **X**, **Y**, and **Z** coordinates of a point on the **Inlet Fan Zone** that is the origin for the fan.

Properties

allows you to define how the fan behaves.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotational Direction

allows you to define the fan's rotational direction, using the right-hand rule with respect to the fan direction vector (that is, a vector from the **Fan Origin** that points into the 3D fan zone perpendicular to the **Inlet Fan Zone**).

Operating Angular Velocity

defines the angular velocity of the fan during the simulation.

Limit Flow Rate Through Fan

specifies that the flow rate through the fan adheres to minimum and maximum values, as defined in the **Flow Rate** group box.

Flow Rate

allows you to define the **Maximum** and **Minimum** flow rates through the fan. This group box is available when the **Limit Flow Rate Through Fan** option is enabled.

Tangential Source Term

enables a momentum source in the tangential direction, based on impeller theory.

Radial Source Term

enables a momentum source in the radial direction, based on impeller theory.

Axial Source Term

enables a momentum source in the axial direction, based on the settings in the **Axial Source Term Settings** group box.

Axial Source Term Settings

allows you to define the momentum source in the axial direction. This group box is only available when the **Axial Source Term** option is enabled.

Method

specifies whether a **constant pressure** or a **fan curve** (that is, a curve created from data points that plot pressure rise vs. volumetric flow rate) defines the axial momentum source.

Pressure Jump

defines the pressure jump that is applied across the 3D fan. This setting is only available when **constant pressure** is selected for the **Method**.

Read Fan Curve...

allows you to read a tab-delimited ASCII file that defines the relationship between pressure and flow rate for each 3D fan cell zone (see 3D Fan Curve File Format (p. 5636) for details). This button is only available when **fan curve** is selected for the **Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Curve Fitting Method

specifies whether Fluent should apply a **polynomial** or **piecewise-linear** fitting method to construct a curve from the data points in the fan curve file. This drop-down list is only available when **fan curve** is selected for the **Method**.

Order of Polynomial

defines the order of the polynomial curve fitting method. This setting is only available when **polynomial** is selected for the **Curve Fitting Method**.

Initial Flow Rate

specifies your best estimate of the initial flow rate through the fan. This setting is only available when **fan curve** is selected for the **Method**.

Test Angular Velocity

specifies the angular velocity of the fan used in the experiment that generated the fan curve data. This setting is only available when **fan curve** is selected for the **Method**.

Test Temperature

specifies the temperature of the fluid flowing through the fan during the experiment that generated the fan curve data. This setting is only available when **fan curve** is selected for the **Method**.

Reaction Tab

lists the parameters for reactions in the porous zone.

Reaction Mechanism

allows you to specify a defined group, or mechanism, of available reactions. See Defining Zone-Based Reaction Mechanisms (p. 2385) for details about defining reaction mechanisms.

Surface-to-Volume Ratio

specifies the surface area of the pore walls per unit volume ($\frac{A}{V}$), and can be thought of as a measure of catalyst loading. With this value, Ansys Fluent can calculate the total surface area on which the reaction takes place in each cell by multiplying $\frac{A}{V}$ by the volume of the cell.

Source Terms Tab

defines a source of heat, mass, momentum, turbulence, species, or other scalar quantity within the fluid zone.

Fixed Values Tab

allows you to specify which variables in the fluid zone are fixed (as a constant value or as defined by a profile or user-defined function), rather than computed during the calculation. See Fixing the Values of Variables (p. 1355) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Local Coordinate System for Fixed Velocities

enables the specification of fixed cylindrical velocity components instead of Cartesian components. The local coordinate system is defined by the **Rotation-Axis Origin** and **Rotation-Axis Direction**.

This item is available only in 3D, and only when the **Fixed Values** option is on.

Multiphase Tab

allows you to set parameters that are specific to the multiphase models.

Compressive Scheme Slope Limiter

ranges from 0 to 2. For example, a **Compressive Scheme Slope Limiter** of 0 corresponds to first order upwind behavior, a value of 1 corresponds to second order upwind, and a value of 2 applies the compressive scheme. The **Multiphase** tab is available only if **Zonal Discretization** is enabled in the Multiphase Model Dialog Box (p. 4648).

Numeric Beach Treatment

is available when **Open Channel Flow** and/or **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box (see Numerical Beach Treatment for Open Channels (p. 3001) for more detail).

Numerical Beach

when enabled expands the dialog box where you can specify the numerical beach parameters.

Beach Group ID

represents the cell zones sharing the damping length containing the same input parameters.

Damping Type

allows you to choose between **One Dimensional** and **Two Dimensional** damping.

One Dimensional

is the damping treatment in the flow direction.

Two Dimensional

is the damping treatment in the flow and gravity direction.

Compute From Inlet Boundary

is set to **none** by default. If there are available open channel boundaries (velocity-inlet, pressure-inlet, and mass-flow-inlet), boundary names are added to the drop-down list. If you select a boundary from the list, the **Level Inputs**, **Damping Length Inputs in Flow Direction**, and **Damping Resistance** values will be up-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dated in the interface. You have the option to overwrite the updated inputs with values that are more applicable to your simulation.

Level Inputs

is only available for the **Two Dimensional** damping type.

Free Surface Level

is the same definition as for open channel flow, see Modeling Open Channel Flows (p. 2975).

Bottom Level

is the same definition as for open channel flow, see Modeling Open Channel Flows (p. 2975), and is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Flow Direction

is the X, Y, and Z (for 3D) components.

Damping Length Inputs in Flow Direction

are required to calculate the start and end points of the damping length in the flow direction.

Damping Length Specification

is only available if **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box. There are two options you can choose from **End Point and Wave Lengths** or **End and Start Points**.

End Point

is the end point of the damping zone.

Start Point

is the starting point in the flow direction.

Wave Length

is updated automatically if the boundary is selected from the **Compute From Inlet Boundary** drop-down list.

Number Of Wave Lengths

is set to 2 by default for the calculation of the damping length.

Relative Velocity Resistance Formulation

calculates the source term using relative velocities in the numerical beach zone when using moving/deforming meshes or moving reference frames.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Linear Damping Resistance

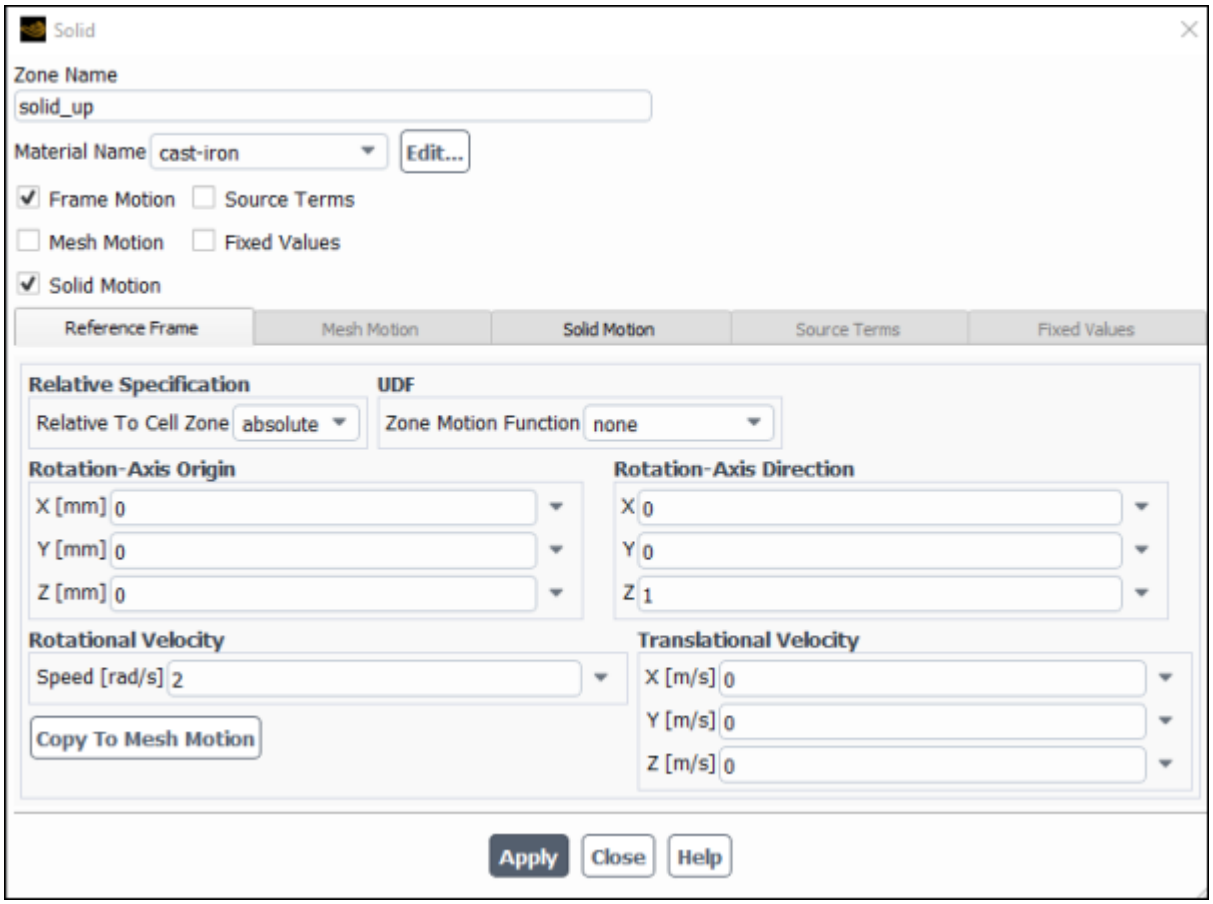
is the resistance per unit time.

Quadratic Damping Resistance

is the resistance per unit length.

50.6.2. Solid Dialog Box

The **Solid** dialog box sets the boundary conditions for a solid cell zone. It is opened from the Cell Zone Conditions Task Page (p. 4906). See Inputs for Solid Zones (p. 1305) for details about the items below.



Controls

Zone Name

sets the name of the zone.

Material Name

selects the material type of the solid. Materials are defined with the Materials Task Page (p. 4831).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frame Motion

enables the moving reference frame model for the cell zone. This option is suitable when the solid zone is moving, but the motion is not relative to an adjacent solid zone. See Defining Zone Motion (p. 1306) and Modeling Flows with Moving Reference Frames (p. 1741) for details.

Mesh Motion

enables the sliding mesh model for the cell zone. See Defining Zone Motion (p. 1306) and Setting Up the Sliding Mesh Problem (p. 1773) for details.

Solid Motion

enables the solid motion model for the cell zone. This option is suitable when the solid zone is moving relative to an adjacent solid zone. See Defining Zone Motion (p. 1306) for details.

Source Terms

enables the specification of a volumetric source of energy. When you turn on this option, the **Source Term** tab will allow you to specify the value for the energy source. See Defining Mass, Momentum, Energy, and Other Sources (p. 1360) for details.

Fixed Values

enables the fixing of the value of one or more variables in the solid zone, rather than computing them during the calculation. See Fixing the Values of Variables (p. 1355) for details.

Important:

You can fix the value of temperature only if you are using the pressure-based solver.

Participates In Radiation

specifies whether or not the solid zone participates in radiation. This option appears when you are using the DO model for radiation.

Reference Frame Tab

lists the parameters that define motion for a moving reference frame. For further details about the following, see Defining Zone Motion (p. 1306).

Relative Specification

provides the **Relative To Cell Zone** drop-down list, which allows you to indicate whether the velocities are absolute velocities (**absolute**) or are relative to the motion of a selected cell zone.

UDF

provides the **Zone Motion Function** drop-down list, which allows you to hook a `DEFINE_ZONE_MOTION` user-defined function that defines the zone motion.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotation-Axis Origin

specifies the origin for the axis of rotation of the solid zone. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction

specifies the direction vector for the solid zone's axis of rotation. This item will appear only for 3D models.

Rotational Velocity

contains an input field for the rotational **Speed** of the zone.

Translational Velocity

contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Copy to Mesh Motion

allows you to switch from frame motion to mesh motion. The variables used for the origin, axis, and velocity components, as well as for the `DEFINE_ZONE_MOTION` user-defined function, will be copied from one model to the other.

Mesh Motion Tab

lists the parameters that define motion for a moving reference frame. For further details about the following, see Defining Zone Motion (p. 1306).

Relative Specification

provides the **Relative To Cell Zone** drop-down list, which allows you to indicate whether the velocities are absolute velocities (**absolute**) or are relative to the motion of a selected cell zone.

UDF

provides the **Zone Motion Function** drop-down list, which allows you to hook a `DEFINE_ZONE_MOTION` user-defined function that defines the zone motion.

Rotation-Axis Origin

specifies the origin for the axis of rotation of the solid zone. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction

specifies the direction vector for the solid zone's axis of rotation. This item will appear only for 3D models.

Rotational Velocity

contains an input field for the rotational **Speed** of the zone.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Translational Velocity

contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Copy to Frame Motion

allows you to switch from mesh motion to frame motion. The variables used for the origin, axis, and velocity components, as well as for the `DEFINE_ZONE_MOTION` user-defined function, will be copied from one model to the other.

Solid Motion Tab

lists the parameters that define solid motion, when the solid zone is moving relative to an adjacent solid zone. For further details about the following, see Defining Zone Motion (p. 1306).

Relative Specification

provides the **Relative To Cell Zone** drop-down list, which allows you to indicate whether the velocities are absolute velocities (**absolute**) or are relative to the motion of a selected cell zone.

UDF

provides the **Solid Motion Function** drop-down list, which allows you to hook a `DEFINE_ZONE_MOTION` user-defined function that defines the zone motion.

Rotation-Axis Origin

specifies the origin for the axis of rotation of the solid zone. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction

specifies the direction vector for the solid zone's axis of rotation. This item will appear only for 3D models.

Rotational Velocity

contains an input field for the rotational **Speed** of the zone.

Translational Velocity

contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Copy to Mesh Motion

allows you to switch from solid motion to mesh motion. The variables used for the origin, axis, and velocity components, as well as for the `DEFINE_ZONE_MOTION` user-defined function, will be copied from one model to the other.

Source Term Tab

lists the parameters for volumetric source of energy.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Energy

displays the total number of energy sources used.

User Scalar n

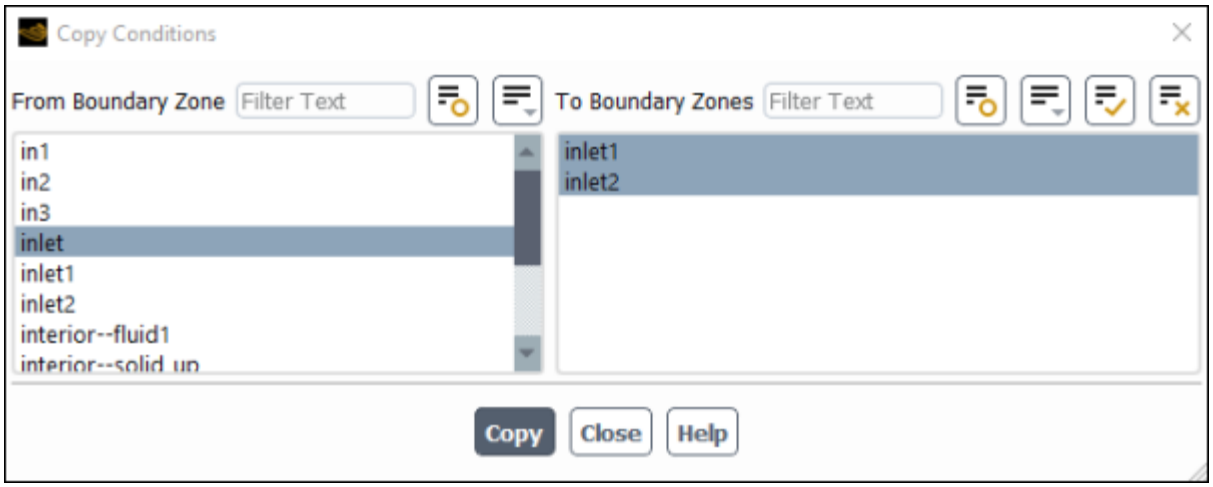
displays the total number of scalars used.

Fixed Values Tab

allows you to specify which variables in the solid zone are fixed (as a constant value or as defined by a profile or user-defined function), rather than computed during the calculation. See Fixing the Values of Variables (p. 1355) for details.

50.6.3. Copy Conditions Dialog Box

The **Copy Conditions** dialog box allows you to copy cell zone and/or boundary conditions from one zone/boundary to other zones/boundaries of the same type. It is opened either from the Cell Zone Conditions Task Page (p. 4906) or from the Boundary Conditions Task Page (p. 4937). See Copying Cell Zone and Boundary Conditions (p. 1283) for details.



Controls

From Zone

specifies the zone that has the conditions you want to copy.

To Zones

specifies the zone or zones to which you want to copy the conditions.

Phase

specifies the phase for which cell zone conditions or boundary conditions are being copied. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See Steps for Copying Cell Zone and Boundary Conditions (p. 2970) for details.

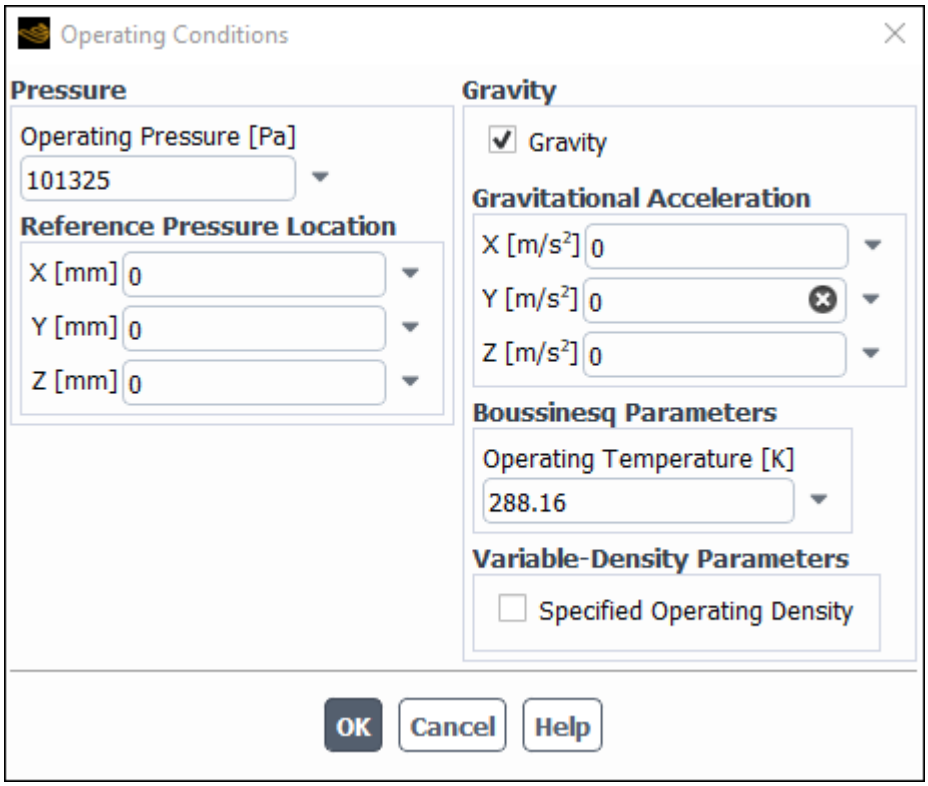
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Copy

copies the cell zone conditions or boundary conditions, setting all of the conditions for the zones selected in the **To Zones** list to be the same as the conditions for the zone selected in the **From Zone** list.

50.6.4. Operating Conditions Dialog Box

The **Operating Conditions** dialog box allows you to set parameters related to operating conditions in your model.



Controls

Pressure

contains items related to the modeling of pressure.

Floating Operating Pressure

specifies the use of a floating operating pressure. See Floating Operating Pressure (p. 1735) for details. This option appears only for time-dependent compressible flows that use the ideal or real gas model.

Operating Pressure

sets the operating pressure for the problem. For all flows, Ansys Fluent uses gauge pressure internally. Any time an absolute pressure is needed, it is generated by adding the operating pressure to the relative pressure. See Operating Pressure (p. 1651) for a detailed description of operating pressure and how to set it.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Pressure Location

sets the location of the cell whose pressure value is used to adjust the gauge pressure field for incompressible flows that do not involve any pressure boundaries. See Using a Reference Pressure to Adjust the Gauge Pressure Field (p. 1653) for details.

Note:

The pressure at the reference pressure location is used to correct the gauge pressure. This is not related to the reference pressure quantity in postprocessing.

Real Gas State

allows you to specify the operating conditions in the subcritical regime of your model. Note that if the operating conditions in your model are entirely in the supercritical regime, this setting will have no effect.

Note:

This option appears only when a Cubic Equation of State Real Gas model is chosen.

Vapor

is the default option, and therefore assumes that the real gas state is vapor.

Liquid

assumes that the real gas state is liquid.

Gravity

contains inputs for gravitational acceleration, the Boussinesq model, and variable density.

Gravity

enables the specification of gravity.

Gravitational Acceleration

sets the x, y, and z components of the gravitational acceleration vector. (The z component is available only in 3D solvers.) See Buoyancy-Driven Flows and Natural Convection (p. 1365) for details about buoyancy-driven flows. This option appears only when **Gravity** is enabled.

Boussinesq Parameters

contains inputs related to the Boussinesq model. This option appears only if **Energy** (in the Energy Dialog Box (p. 4662)) and **Gravity** are enabled. See The Boussinesq Model (p. 1366) for more information on the Boussinesq model.

Operating Temperature

sets the operating temperature (T_0 in Equation 7.67 (p. 1366)) for use with the Boussinesq approximation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Variable-Density Parameters

contains inputs related to the modeling of variable density. This option appears only when **Gravity** is enabled.

Specified Operating Density

enables the specification of operating density. See If you are using the incompressible ideal gas law, check the Operating Density (p. 1369) for details. This item is available for single-phase flows only.

Operating Density Method

specifies which method will be used to calculate the operating density. You can choose **minimum-phase-averaged**, **primary-phase-averaged**, **mixture-averaged**, or **user-input**. For information about these methods, see Modeling Buoyancy-Driven Multiphase Flow (p. 2926).This item is available for buoyancy-driven multiphase flows only.

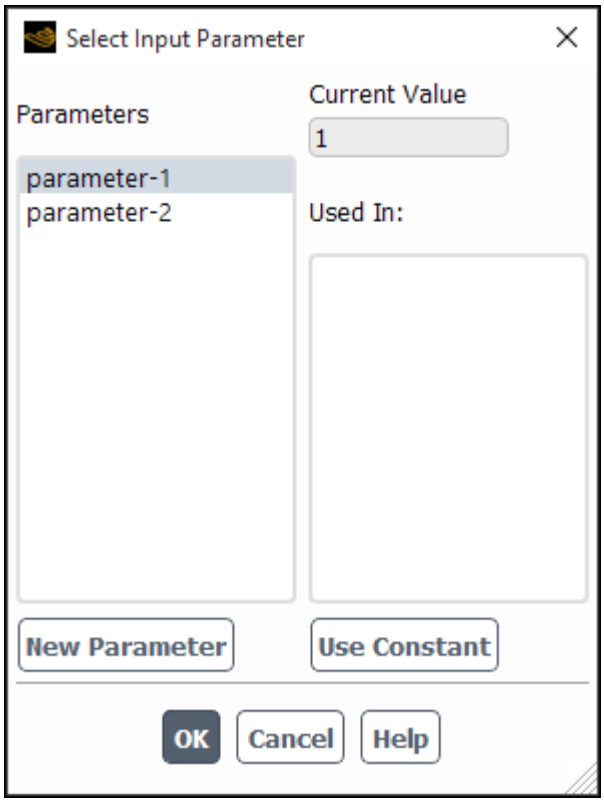
Operating Density

sets the operating density (ρ_0 in Equation 7.68 (p. 1369)). This item is available when either **Specified Operating Density** is enabled for a single-phase flow or the **user-input** operating density method is selected for a multiphase flow.

50.6.5. Select Input Parameter Dialog Box

The **Select Input Parameter** dialog box allows you to choose from a listing of existing input parameters as well as to create and define new input parameters. For more information about parameters, see Defining and Viewing Parameters (p. 1287) in the User's Guide, and see Working With Input and Output Parameters in Workbench in the Ansys Fluent in Workbench User's Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Parameters

contains a list of existing compatible input parameters

Current Value

displays the value of the currently selected parameter.

Used In

lists any variables that are already associated with the currently selected parameter.

Use Constant

allows you to change the associated parameter to a constant (that is, real) value.

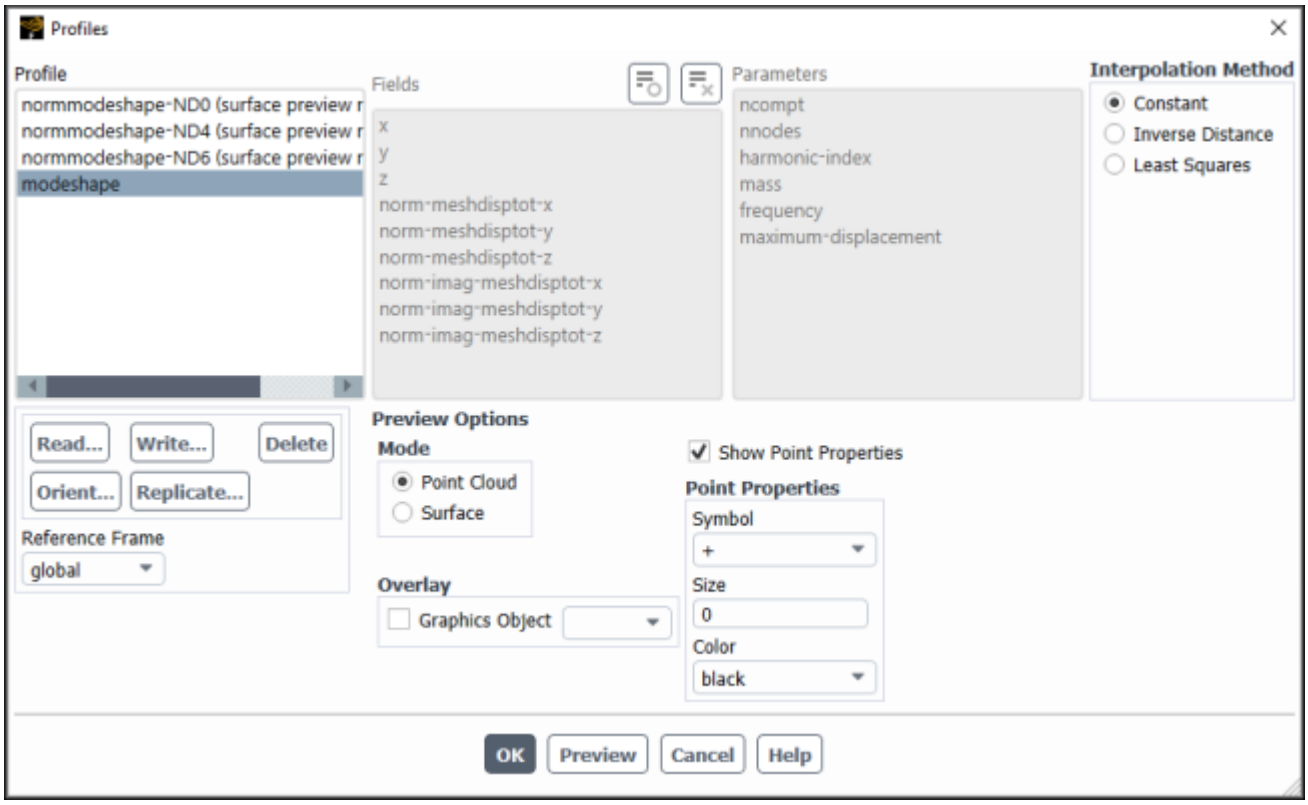
New Parameter

opens the Parameter Expression Dialog Box (p. 5289), in which you can assign names and values to an input parameter.

50.6.6. Profiles Dialog Box

The **Profiles** dialog box allows you to define new profiles by reading cell zone and boundary profile files. You can also examine the existing profile definitions and delete unused profiles. See Profiles (p. 1540) for details about cell zone and boundary profiles.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Profile

contains a selectable list of available profiles. When a profile is selected its available fields are displayed under **Fields**. Parameters, if included in the profile, are displayed under **Parameters**.

Fields

displays the fields available in the selected profile. After the profile file has been read, these fields will also appear in any boundary condition dialog box (for example, the **Velocity Inlet** dialog box) that allows profile specification of a variable. To the right of (or below) the variable in the boundary conditions dialog box, there will be a drop-down list that contains a **constant** and the fields from available profile files. To use a particular profile field, just select it from the list.

Parameters

contains a read-only list of parameters included in the selected CSV profile (when applicable).

Interpolation Method

allows you to select the interpolation method for the profile selected from the **Profile** list. This selection is only available for point profiles, and will only take effect when the **Apply** button is clicked. The choices include the following:

Constant

specifies that Ansys Fluent should use zeroth-order interpolation to assign the point profile values to the nearest cell faces at the boundary. This is the default selection.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Inverse Distance

specifies that Ansys Fluent should assign a value to each cell face at the boundary based on weighted contributions from the values in the point profile file. The weighting factor is inversely proportional to the distance between the profile point and the cell face center.

Least Squares

specifies that Ansys Fluent should assign values to the cell faces at the boundary through a first-order interpolation method that tries to minimizes the sum of the squares of the offsets (residuals) between the profile data points and the cell face centers.

Reference Frame

allows you to attach the profile to a reference frame. If you select a reference frame other than **global**, then the profile will follow the orientation and/or motion of the specified reference frame.

Read...

opens The Select File Dialog Box (p. 907) so that you can read a boundary profile file. If a profile in the file has the same name as an existing profile, the old profile will be overwritten.

Write...

opens the Write Profile Dialog Box (p. 4936), in which you can save profile data.

Delete

deletes the selected profile from memory.

Orient...

opens the Orient Profile Dialog Box (p. 4934), in which you can reorient and scale the profile. This item appears only in 3D.

Replicate...

opens the Replicate Profile Dialog Box (p. 4932), in which you can reorient and scale the profile. This item appears only in 3D.

Preview Options

contains options for previewing profiles as a cloud of points or as a surface.

Point Cloud

preview the profile as a cloud of points.

Surface

preview the profile as a surface. *This option requires that the profile contain node-connectivity data. Profile that do not have this data are indicated as such in the* ***Profile*** *list.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Show Point Properties

optionally expands additional settings for how points are displayed when previewing the profile as a point cloud.

Symbol

specifies the symbol used to represent the points in the point cloud preview.

Size

controls the size of the points in the point cloud preview.

Color

specifies the color of the points in the point cloud preview.

Overlay Graphics Object

allows you to overlay any defined mesh or contour plots when previewing a profile as either a surface or a point cloud.

OK

sets the selection made in the **Interpolation Method** list for point profiles in preparation for interpolation. The profile is not actually interpolated until a profile field is selected in a boundary condition dialog box (for example, the **Velocity Inlet** dialog box) and the solution is initialized.

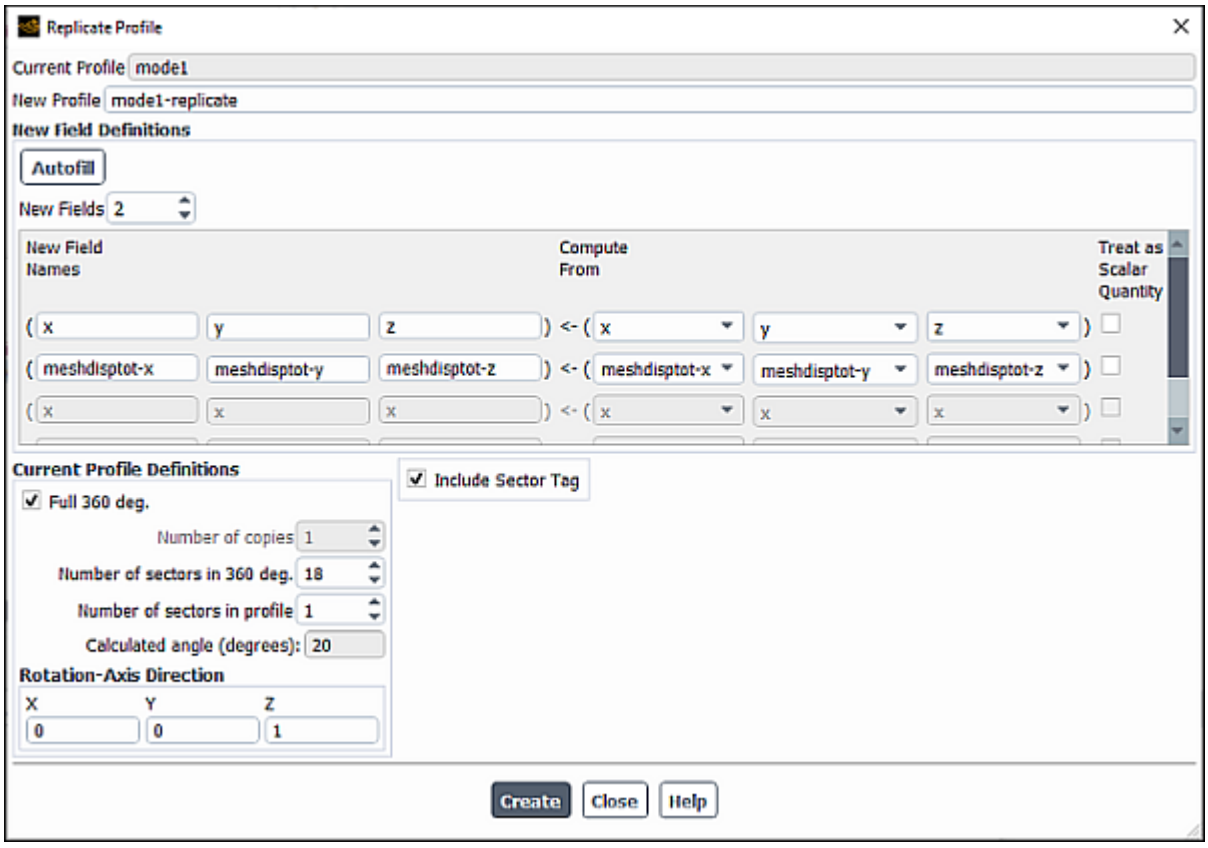
Preview

displays the selected profile as either a point cloud or a surface, depending on which **Mode** is selected.

50.6.7. Replicate Profile Dialog Box

The **Replicate Profile** dialog box allows you to replicate a profile periodically, typically for use as a boundary condition in a turbomachinery case. See Replicating Profiles (p. 1556) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Current profile

shows the name of the currently selected profile in the Profiles Dialog Box (p. 4929). This is the profile on which the new profile will be based.

New Profile

sets the name of the new cell zone or boundary profile.

New Field Definitions

contains inputs and controls for the definition of the vector and scalar fields in the new profile.

New Fields

sets the number of data fields in the new profile.

New Field Names

contains inputs for the names of the data fields in the new profile. For a vector field, all 3 inputs in each row will be active; for a scalar field, only the first will be active.

Compute From...

contains drop-down lists with the names of the fields in the **Current profile**. In these lists, select the fields from which the **New Field Names** will be computed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Treat as Scalar Quantity

indicates (if on) that the adjacent field is a scalar quantity. If this option is off, the field is a vector quantity.

Current Profile Definitions

contains inputs for the replication of the new profile.

Full 360 deg.

automatically determines the number of copies of the original profile that are needed to make the full 360 degree profile based on the other information you specify

Number of copies

specifies how many copies of the original profile are created.

Number of sectors in 360 deg.

the number of periodic sections, based on the original profile, that are present in 360 degrees.

Number of sectors in profile

the number of periodic sections in the original profile.

Calculated angle

(for display only) the angle occupied by the original profile.

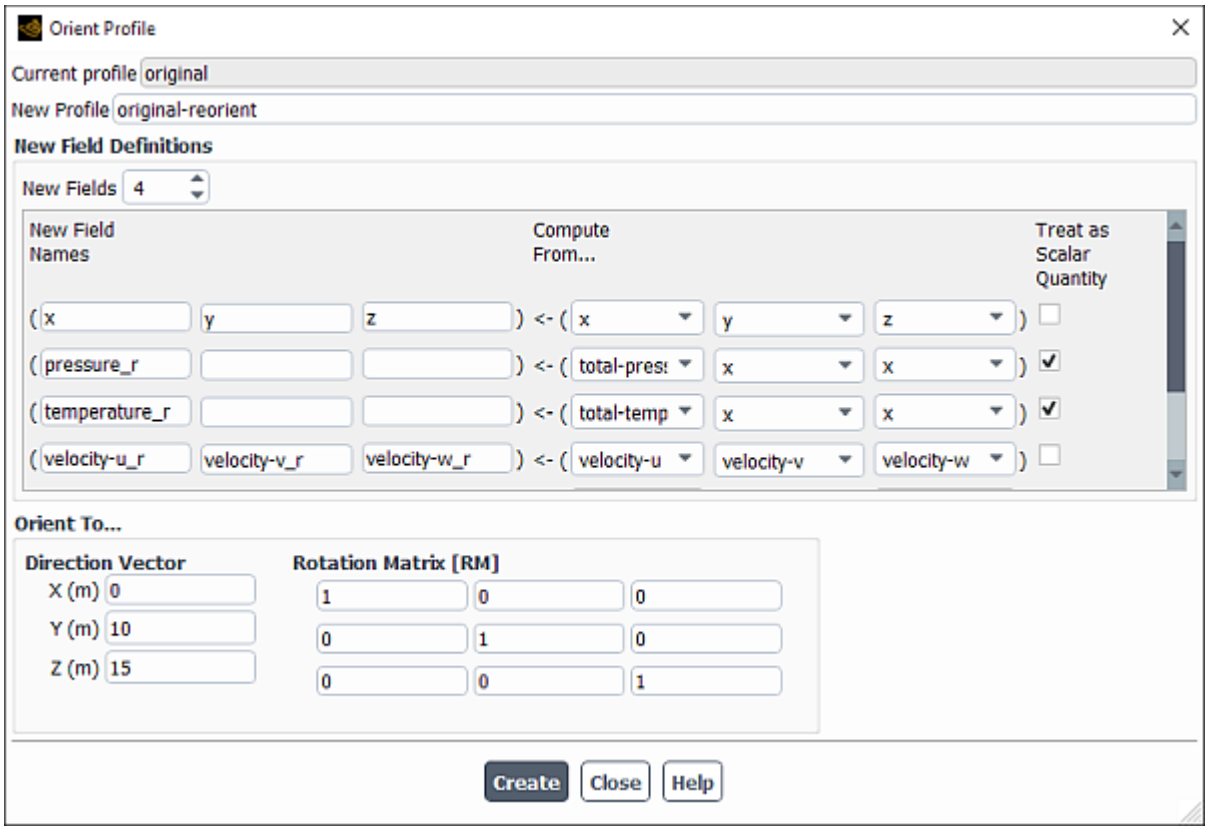
Create

creates a new profile using the information specified in the dialog box.

50.6.8. Orient Profile Dialog Box

The **Orient Profile** dialog box allows you to reorient a profile so that you can apply it to a particular boundary. See Reorienting Profiles (p. 1551) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Current profile

shows the name of the currently selected profile in the Profiles Dialog Box (p. 4929). This is the profile on which the new profile will be based.

New Profile

sets the name of the new cell zone or boundary profile.

New Field Definitions

contains inputs and controls for the definition of the vector and scalar fields in the new profile.

New Fields

sets the number of data fields in the new profile.

New Field Names

contains inputs for the names of the data fields in the new profile. For a vector field, all 3 inputs in each row will be active; for a scalar field, only the first will be active.

Compute From...

contains drop-down lists with the names of the fields in the **Current profile**. In these lists, select the fields from which the **New Field Names** will be computed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Treat as Scalar Quantity

indicates (if on) that the adjacent field is a scalar quantity. If this option is off, the field is a vector quantity.

Orient To...

contains inputs for the definition of the local coordinate system for the new profile. This coordinate system will determine the orientation of the profile.

Direction Vector

is the vector that translates a cell zone or boundary profile to the new position, and is defined between the centers of the profile fields.

Rotation Matrix [RM

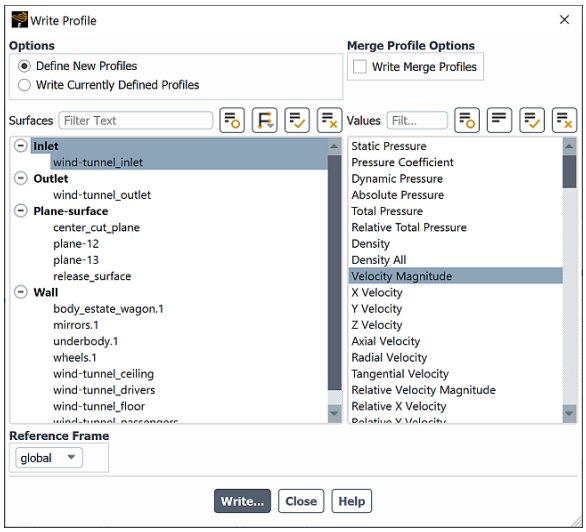
] specifies the rotational matrix RM, which is based on Euler angles (γ, β, and α) that define an orthogonal system $x'y'z'$ as the result of the three successive rotations from the original system xyz. See Reorienting Profiles (p. 1551) for more information.

Create

creates a new profile using the information specified in the dialog box.

50.6.9. Write Profile Dialog Box

The **Write Profile** dialog box allows you to create a profile file from the conditions on a specified cell zone or boundary/surface. See Writing Profile Files (p. 940) for details on writing profile files.



Controls

Options

contains options for writing profiles.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Define New Profiles

enables the creation of a profile file from the conditions on a specified boundary or surface.

Write Currently Defined Profiles

enables the creation of a profile file containing all profiles that are currently defined.

Merge Profile Options

Write Merge Profiles

(only available if two or more surfaces are selected) writes a `.csv` file with the selected surfaces consolidated into one set of data points.

Surfaces

contains a selectable list of surfaces where data can be extracted to write a profile.

Values

contains a selectable list of variables that you use for creating profiles.

Reference Frame

selectable list of reference frames that specifies which reference frame will be used in writing the profile.

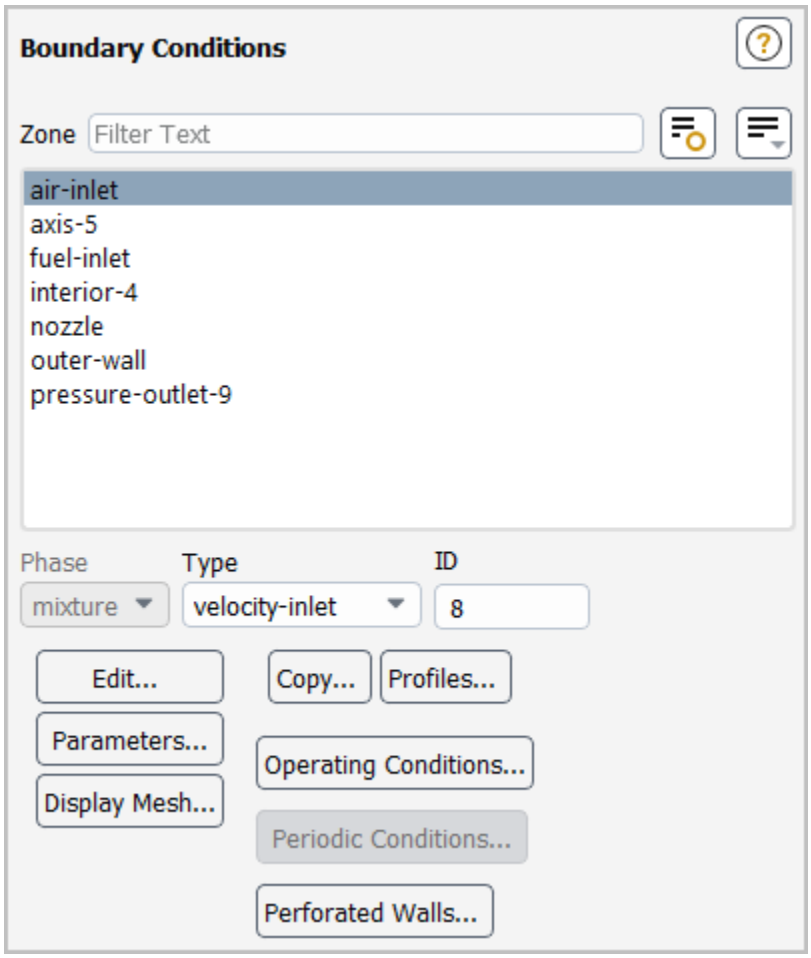
Write...

opens The Select File Dialog Box (p. 907), where you can specify a filename for the profile file.

50.7. Boundary Conditions Task Page

The **Boundary Conditions** task page allows you to set the type of a boundary and display other dialog boxes to set the boundary condition parameters for each boundary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone

contains a selectable list of boundary zones from which you can select the zone of interest. You can check a zone type by using the mouse probe (see Controlling the Mouse Button Functions (p. 3989)) on the displayed physical mesh. This feature is particularly handy if you are setting up a problem for the first time, or if you have two or more boundary zones of the same type and you want to determine the zone IDs. To do this you must first display the mesh with the Mesh Display Dialog Box (p. 4636). Then click the boundary zone with the right (select) mouse button. Ansys Fluent will print the zone ID and type of that boundary zone in the console window.

Phase

specifies the phase for which conditions at the selected boundary **Zone** are being set. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type

contains a drop-down list of boundary condition types for the selected zone. The list contains all possible types to which the zone can be changed.

Important:

Note that you cannot use this method to change zone types to or from the periodic type, since additional restrictions exist for this boundary type. Creating Periodic Zones and Interfaces (p. 1246) explains how to create and uncouple periodic zones.

ID

displays the zone ID number of the selected zone. (This is for informational purposes only; you cannot edit this number.)

Edit...

opens the appropriate dialog box for setting the boundary conditions for that particular boundary type.

Copy...

opens the Copy Conditions Dialog Box (p. 4925), which allows you to copy boundary conditions from one zone to other zones of the same type. See Copying Cell Zone and Boundary Conditions (p. 1283) for details.

Profiles...

opens the Profiles Dialog Box (p. 4929).

Parameters...

opens the Parameters Dialog Box (p. 5284).

Operating Conditions...

opens the Operating Conditions Dialog Box (p. 4926).

Display Mesh...

opens the Mesh Display Dialog Box (p. 4636).

Periodic Conditions...

opens the Periodic Conditions Dialog Box (p. 5050).

Perforated Walls...

opens the **Perforated Walls** Dialog Box (p. 5051).

For additional information, see the following sections:

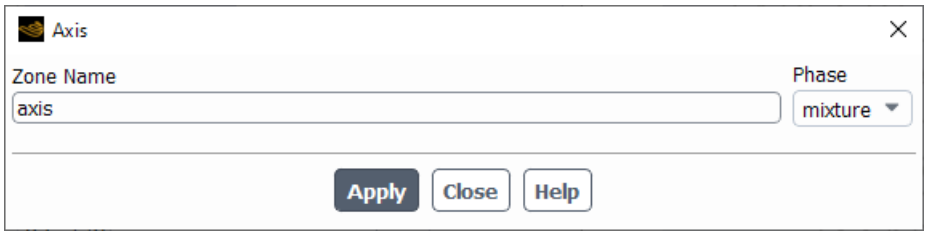
50.7.1. Axis Dialog Box

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.2. Degassing Dialog Box
50.7.3. Exhaust Fan Dialog Box
50.7.4. Fan Dialog Box
50.7.5. Inlet Vent Dialog Box
50.7.6. Intake Fan Dialog Box
50.7.7. Interface Dialog Box
50.7.8. Interior Dialog Box
50.7.9. Mass-Flow Inlet Dialog Box
50.7.10. Mass-Flow Outlet Dialog Box
50.7.11. Outflow Dialog Box
50.7.12. Outlet Vent Dialog Box
50.7.13. Overset Dialog Box
50.7.14. Periodic Dialog Box
50.7.15. Porous Jump Dialog Box
50.7.16. Pressure Far-Field Dialog Box
50.7.17. Pressure Inlet Dialog Box
50.7.18. Pressure Outlet Dialog Box
50.7.19. Radiator Dialog Box
50.7.20. RANS/LES Interface Dialog Box
50.7.21. Symmetry Dialog Box
50.7.22. Velocity Inlet Dialog Box
50.7.23. Wall Dialog Box
50.7.24. Periodic Conditions Dialog Box
50.7.25. Perforated Walls Dialog Box

50.7.1. Axis Dialog Box

The **Axis** dialog box can be used to modify the name of an axis zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 4937). See Axis Boundary Conditions (p. 1480) for information about axis boundaries.



Controls

Zone Name

sets the name of the zone.

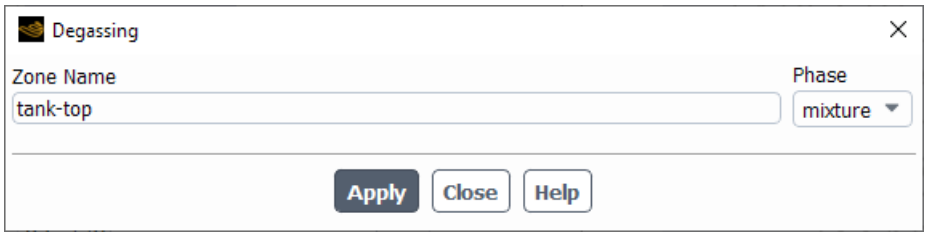
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Phase

displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

50.7.2. Degassing Dialog Box

The **Degassing** dialog box can be used to modify the name of a degassing zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 4937). See Degassing Boundary Conditions (p. 1434) for information about axis boundaries.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase.

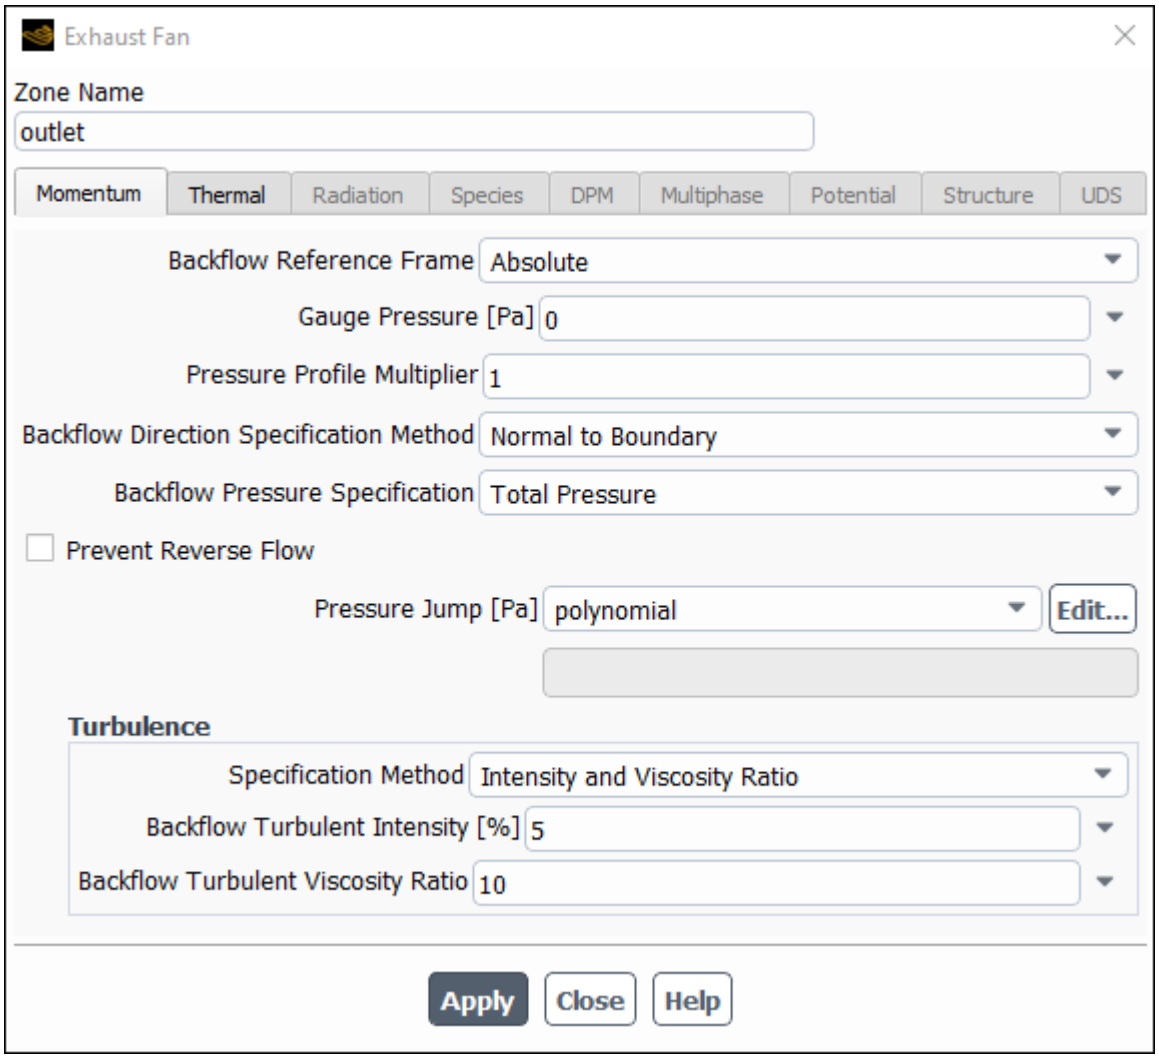
50.7.3. Exhaust Fan Dialog Box

The **Exhaust Fan** dialog box sets the boundary conditions for an exhaust fan zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Exhaust Fan Boundaries (p. 1432) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. It appears only for multiphase flows.

Momentum

contains the momentum parameters.

Backflow Reference Frame

specify whether backflow temperature, pressure, and flow directions are in the **Absolute** or **Relative to the Adjacent Cell Zone** reference frame.

Gauge Pressure

sets the gauge pressure at the outlet boundary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Direction Specification Method

sets the direction of the inflow stream should the flow reverse direction. You can choose **Direction Vector**, **Normal to Boundary**,or **From Neighboring Cell**.

Coordinate System

contains a drop-down list for selecting the coordinate system. You can choose **Cartesian**, **Cylindrical**, or **Local Cylindrical**. This option is available only when **Direction Vector** is selected from the **Backflow Direction Specification Method** drop-down list.

X-, Y-, Z-Component of Flow Direction

allows you to specify the velocity components in x, y, and z directions respectively. This option is available when **Cartesian** is selected for the **Coordinate System**.

Radial-, Tangential-, Axial-Component of Flow Direction

set the direction of the flow at the boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Backflow Pressure Specification

specifies how the pressure is calculated under backflow conditions. If you select **Static Pressure**, the **Gauge Pressure** is directly imposed as the boundary face pressure; if you select **Total Pressure**, the **Gauge Pressure** will be combined with a dynamic contribution that is based on the velocity in the adjacent cell zone.

Pressure Jump

specifies the rise in pressure across the fan. See Specifying the Pressure Jump (p. 1433) for details.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Turbulence

displays the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Backflow Turbulent Kinetic Energy, Backflow Specification Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Backflow Modified Turbulent Viscosity

sets the value of the backflow modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Backflow Turbulent Viscosity Ratio

sets the value of the backflow turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulence Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters. This parameter is available only when the energy equation is turned on.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Total Temperature

sets the total temperature of the inflow stream should the flow reverse direction.

Radiation

contains the boundary conditions for the radiation model at the exhaust fan.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the fan participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the fan.

Participates in View Factor Calculation

specifies whether or not the fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution (see Particle Reflection at Wall in the *Fluent Theory Guide*).

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Multiphase

contains the multiphase parameters.

Backflow Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction Specification Method

sets the method used to specify the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Backflow Volume Fraction

specifies the volume fraction of the secondary phase as a constant, profile, of UDF function.

From Neighboring Cell

calculates the volume fraction from the neighboring cells.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User-Defined Scalar Boundary Value

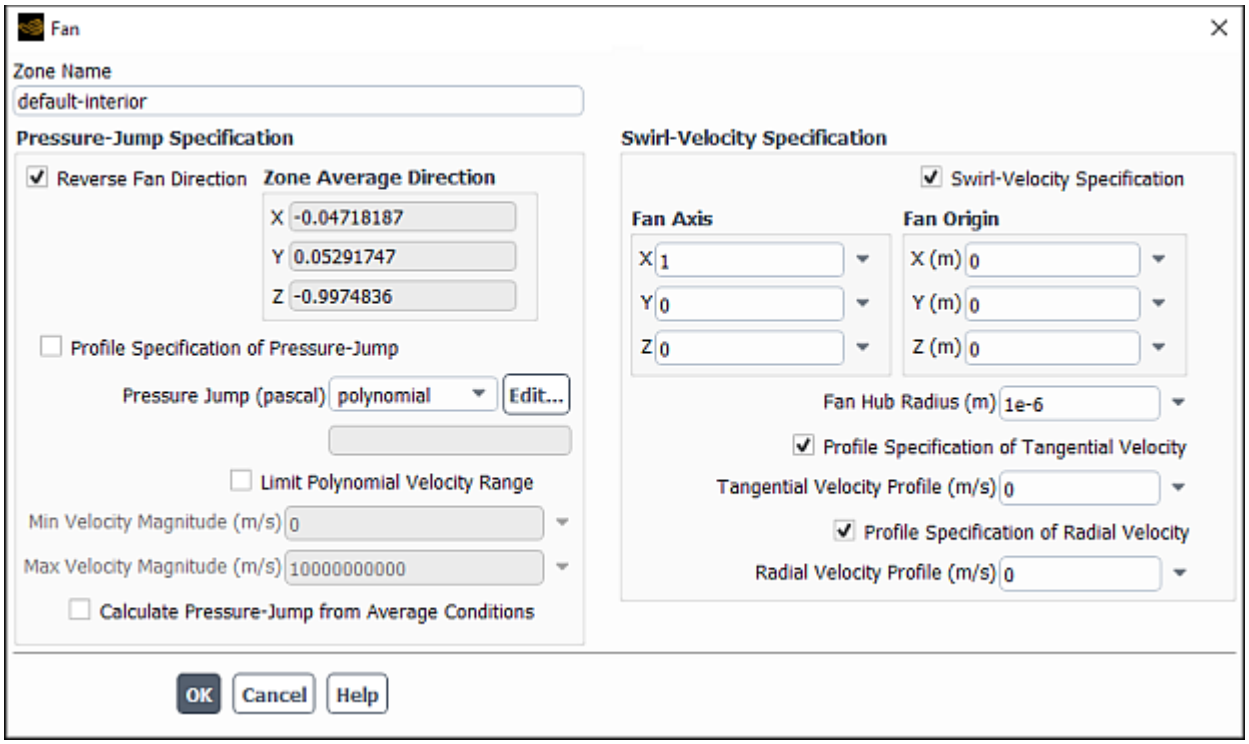
appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

50.7.4. Fan Dialog Box

The **Fan** dialog box sets the boundary conditions for a fan zone. It is opened from the Boundary Conditions Task Page (p. 4937). See User Inputs for Fans (p. 1482) for details about the items below.



Controls

Zone Name

sets the name of the zone.

Pressure-Jump Specification

contains inputs that define the pressure jump across the fan.

Reverse Fan Direction

sets the fan flow direction relative to the zone direction. If **Zone Average Direction** is pointing in the direction you want the fan to blow, do *not* select **Reverse Flow**; if it is pointing in the opposite direction, select **Reverse Flow**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zone Average Direction

displays the (face-averaged) direction vector for the zone as an aid in determining whether or not you want to select **Reverse Flow**.

Profile Specification of Pressure-Jump

enables the use of a boundary profile or user-defined function for the pressure jump specification. See Profiles (p. 1540) or the Fluent Customization Manual for details. When this option is enabled, **Pressure Jump Profile** will appear in the dialog box and the next four items below it will not.

Pressure Jump Profile

contains a drop-down list from which you can select a boundary profile or a user-defined function for the pressure jump definition. This item will appear if you enable **Profile Specification of Pressure-Jump**.

Pressure-Jump

specifies the pressure-jump as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See Defining the Pressure Jump (p. 1483) for details.

Limit Polynomial Velocity Range

limits the minimum and maximum velocity magnitudes used to calculate the pressure jump when it is defined as a function of velocity.

Min Velocity Magnitude, Max Velocity Magnitude

specify the minimum and maximum values to which the velocity magnitude is limited (when the **Limit Polynomial Velocity Range** option is enabled).

Calculate Pressure-Jump from Average Conditions

enables the option to use the mass-averaged velocity normal to the fan to determine a single pressure-jump value for all faces in the fan zone.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior

allows the particles to pass through the boundary.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Swirl-Velocity Specification

contains inputs for the specification of fan swirl velocity. This section of the dialog box appears only for 3D models.

Swirl-Velocity Specification

enables the specification of a swirl velocity for the fan.

Fan Axis

sets the direction vector for the fan's axis of rotation.

Fan Origin

sets the origin in the global coordinate system through which the fan rotation axis passes.

Fan Hub Radius

set the radius of the hub. The default is 1e-6 to avoid division by zero in the polynomial.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Profile Specification of Tangential Velocity

enables the use of a boundary profile or user-defined function for the tangential velocity specification. See Profiles (p. 1540) or the Fluent Customization Manual for details. When this option is enabled, **Tangential Velocity Profile** will appear in the dialog box and **Tangential-Velocity Polynomial Coefficients** will not.

Tangential Velocity Profile

contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the tangential velocity. This item will appear if you enable **Profile Specification of Tangential Velocity**.

Tangential-Velocity Polynomial Coefficients

sets the coefficients for the tangential velocity polynomial. Separate the coefficients by spaces.

Profile Specification of Radial Velocity

enables the use of a boundary profile or user-defined function for the radial velocity specification. See Profiles (p. 1540) or the Fluent Customization Manual for details. When this option is enabled, **Radial Velocity Profile** will appear in the dialog box and **Radial-Velocity Polynomial Coefficients** will not.

Radial Velocity Profile

contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the radial velocity. This item will appear if you enable **Profile Specification of Radial Velocity**.

Radial-Velocity Polynomial Coefficients

sets the coefficients for the radial velocity polynomial. Separate the coefficients by spaces.

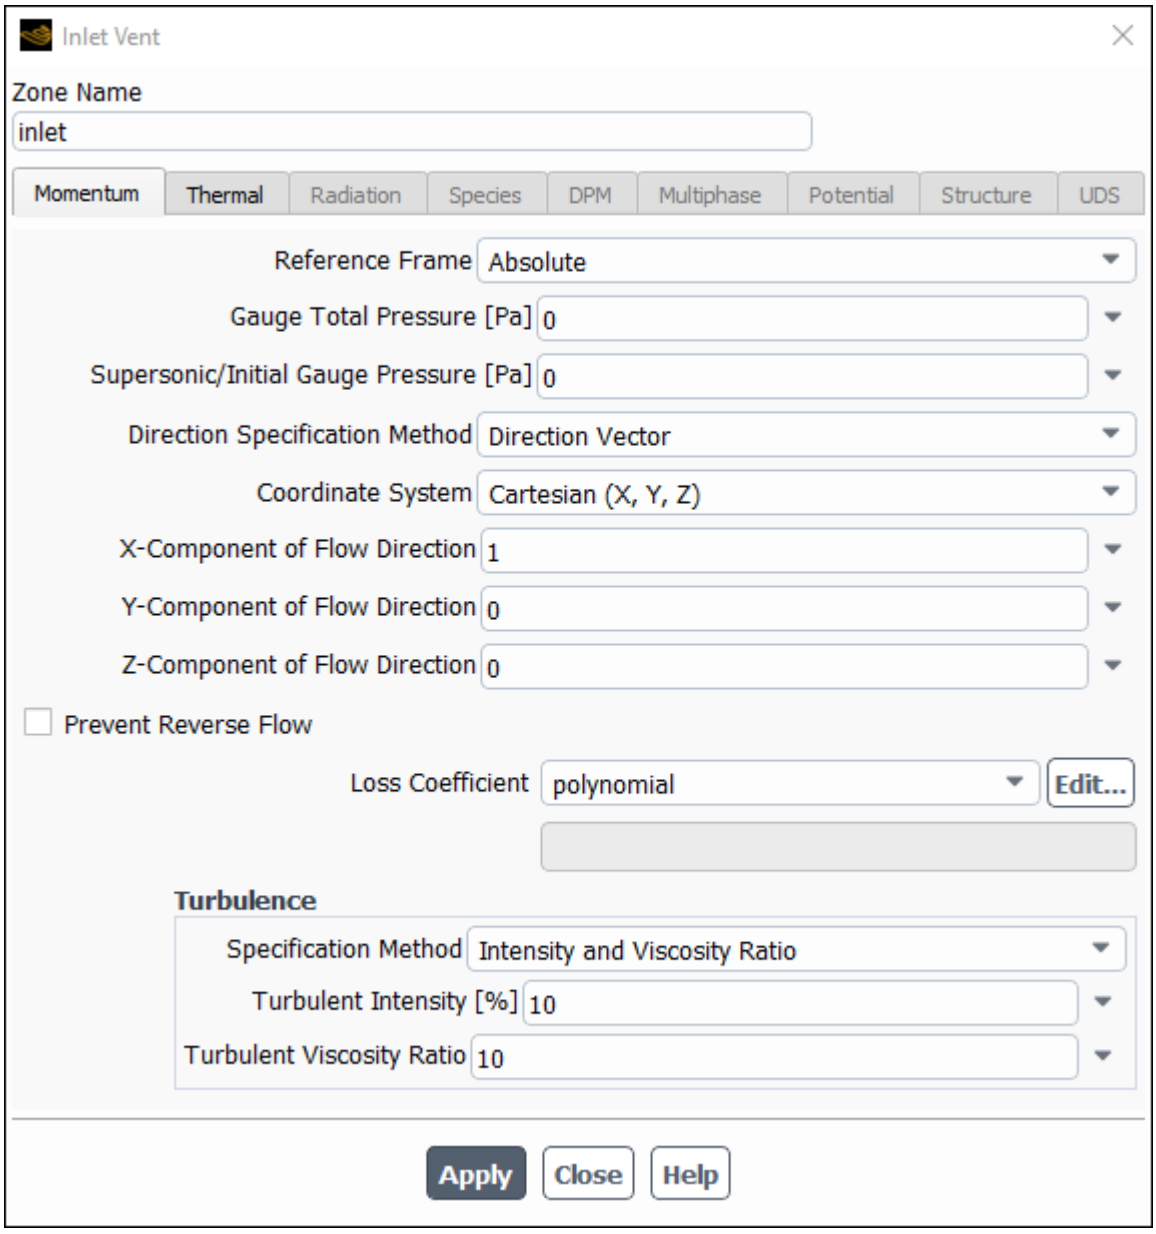
50.7.5. Inlet Vent Dialog Box

The **Inlet Vent** dialog box sets the boundary conditions for an inlet vent zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Inlet Vent Boundaries (p. 1407) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the inlet vent. If the cell zone adjacent to the inlet vent is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the inlet vent boundary condition is selected for computing initial values (see Initializing the Entire Flow Field Using Standard Initialization (p. 3614)).

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See Defining the Flow Direction (p. 1383) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**, **Local Cylindrical Swirl** vector components will be specified. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Loss-Coefficient

sets the non-dimensional loss coefficient used to compute the pressure drop. See Specifying the Loss Coefficient (p. 1409) for details.

Turbulence

lists the turbulence parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulence Intensity, Turbulence Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulence Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulence Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulence Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total temperature.

Radiation

contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the inlet vent participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the inlet vent.

Participates in View Factor Calculation

specifies whether or not the inlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: “Trap” Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: “Escape” Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction

specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Open Channel

is available when the VOF model with open channel flow is enabled.

Secondary Phase for Inlet

is where the specified parameters are valid only for one secondary phase. In case of a three-phase flow, select the corresponding secondary phase from this list. This appears when **Open Channel** is enabled.

Flow Specification Method

allows you to select the type of flow. You can choose **Free Surface Level and Velocity**, **Total Height and Velocity**, or **Free Surface Level and Total Height**. This appears when **Open Channel** is enabled.

Free Surface Level

can be determined using the absolute value of height from the free surface to the origin in the direction of gravity, or by applying the correct sign based on whether the free surface level is above or below the origin.

Total Height

is used as an option for describing the flow. It is given by Equation 25.12 (p. 2980).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bottom Level

is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Velocity Magnitude

sets the magnitude of the velocity vector at the inflow boundary.

Level-Set Function Flux

appears if the **Coupled Level Set + VOF** option is enabled for the VOF model.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

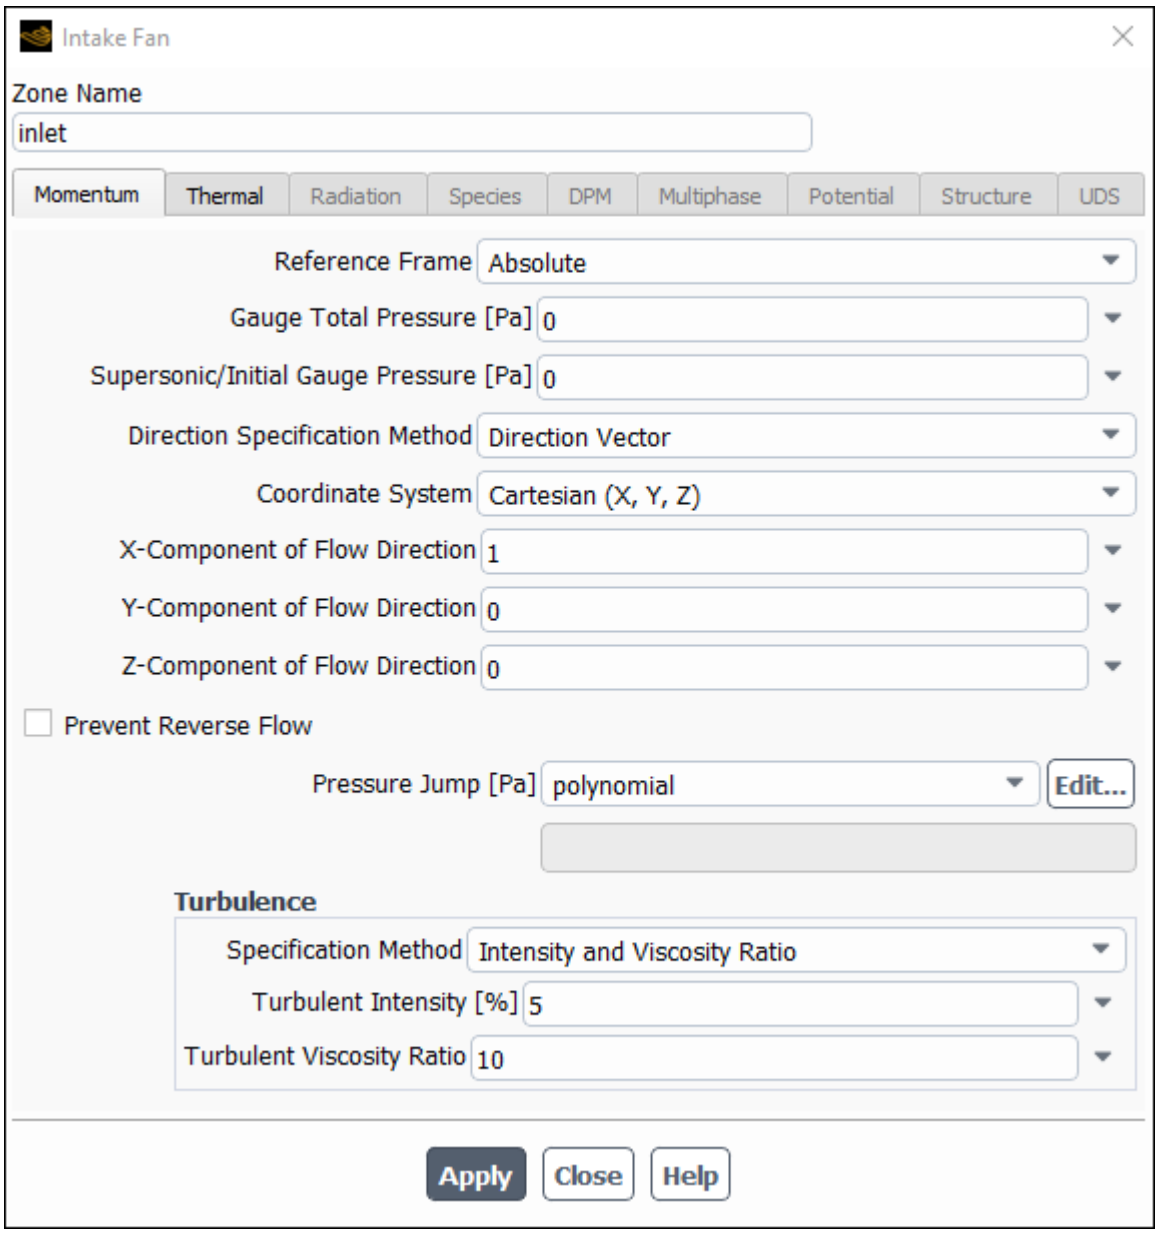
User Scalar n

specifies the value of the scalar.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.6. Intake Fan Dialog Box

The **Intake Fan** dialog box sets the boundary conditions for an intake fan zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Intake Fan Boundaries (p. 1410) for details about defining the items below.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the intake fan. If the cell zone adjacent to the intake fan is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the intake fan boundary condition is selected for computing initial values (see Initializing the Entire Flow Field Using Standard Initialization (p. 3614)).

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See Defining the Flow Direction (p. 1383) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be defined. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X-, Y-, Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial-, Tangential-, Axial-Component of Flow Direction

set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Pressure Jump

specifies the rise in pressure across the fan. See Specifying the Pressure Jump (p. 1412) for details.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Turbulence

consists of the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total temperature.

Radiation

contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the intake fan participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the intake fan.

Participates in View Factor Calculation

specifies whether or not the intake fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction

specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

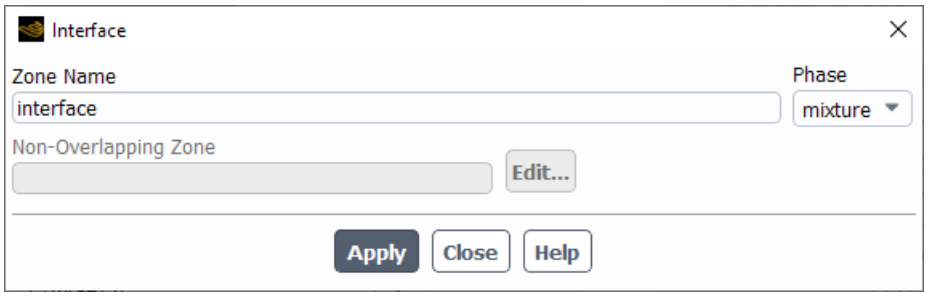
appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

50.7.7. Interface Dialog Box

The **Interface** dialog box can be used to modify the name of an interface zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 4937). Interface zones are used for multiple reference frame and sliding mesh calculations, and for non-conformal meshes. See The Multiple Reference Frame Model (p. 1751), Setting Up the Sliding Mesh Problem (p. 1773), and Non-Conformal Meshes (p. 1149) for details.



Controls

Zone Name

sets the name of the zone.

Non-Overlapping Zone

displays the name of the non-overlapping zone created for this interface zone as part of the creation of a mesh interface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edit...

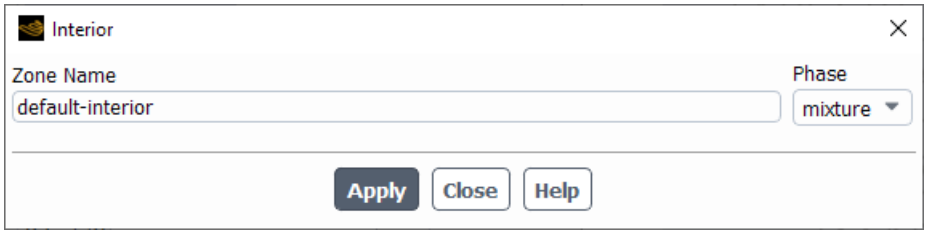
opens the boundary condition dialog box of the non-overlapping zone, so that you can easily review and/or revise the settings.

Phase

displays the name of the phase. This item appears only for multiphase flows.

50.7.8. Interior Dialog Box

The **Interior** dialog box can be used to modify the name of an interior zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 4937).



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. This item appears only for multiphase flows.

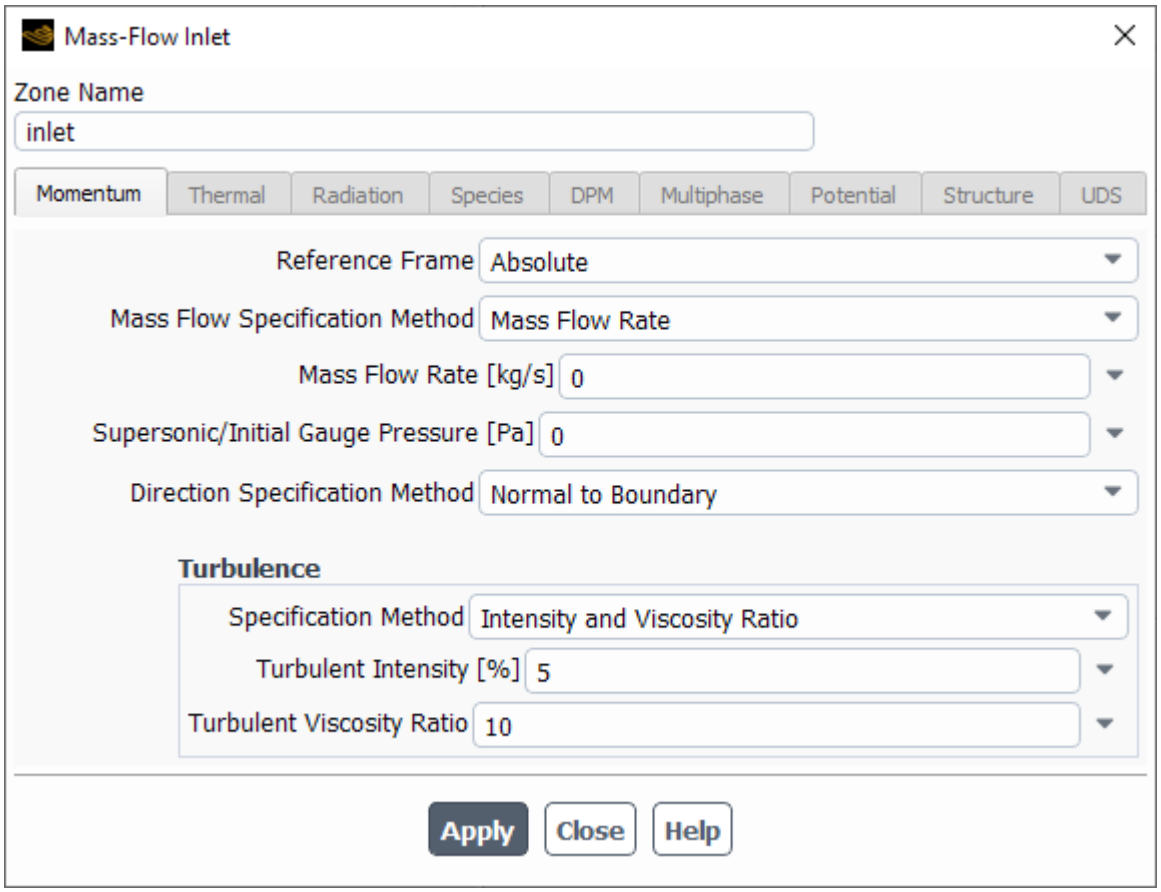
50.7.9. Mass-Flow Inlet Dialog Box

The **Mass-Flow Inlet** dialog box sets the boundary conditions for a mass-flow inlet zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Mass-Flow Inlet Boundaries (p. 1396) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

displays the momentum boundary conditions.

Reference Frame

specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Mass Flow Specification Method

specifies whether you are defining **Mass Flow Rate**, **Mass Flux**, or **Mass Flux with Average Mass Flux**.

Mass Flow Rate

sets the prescribed mass flow rate for the zone. This flow rate is converted internally to a prescribed uniform mass flux over the zone by dividing the flow rate by the flow direction

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

area projection of the zone. This item will appear if you selected **Mass Flow Rate** in the **Mass Flow Specification Method** list.

Important:

Note that for axisymmetric problems, this mass flow rate is the flow rate through the entire (2π-radian) domain, not through a 1-radian slice.

Mass Flux

sets the prescribed mass flux for the zone. This item will appear if you selected **Mass Flux** or **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

Important:

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Average Mass Flux

sets the average mass flux through the zone. See More About Mass Flux and Average Mass Flux (p. 1398) for details. This item will appear if you selected **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

Important:

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Supersonic/Initialization Gauge Pressure

sets the static pressure that will be used to initialize the flow field if the mass-flow inlet boundary condition is selected for initializing flow properties (see Initializing the Entire Flow Field Using Standard Initialization (p. 3614)).

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See Defining the Flow Direction (p. 1383) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be defined. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X-, Y-, Z-Component of Flow Direction

set the velocity-direction vector of the inflow stream. This vector does not need to be normalized (for example, you can specify the vector (1 1 1) rather than (0.577 0.577 0.577)). These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial-, Tangential-, Axial-Component of Flow Direction

set the velocity-direction vector of the inflow stream. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Axial-, Radial-Component of Flow Direction, Tangential-Velocity

appear for a 3D **Local Cylindrical Swirl** coordinate system.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical (swirl) coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical (swirl) coordinate system.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Acoustic Wave Model

contains settings for treatment of acoustic pressure waves at the boundary.

Off

disables special treatment of acoustic pressure waves at the boundary.

Non Reflecting

enables the general non-reflecting boundary condition treatment described in General Non-Reflecting Boundary Conditions (p. 1514).

Impedance

enables the impedance boundary condition treatment described in Impedance Boundary Conditions (p. 1521).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Transparent Flow Forcing

enables the transparent flow forcing boundary condition described in Transparent Flow Forcing Boundary Conditions (p. 1530).

Impedance Parameters

contains the parameters for the impedance boundary condition treatment. For details refer to Using the Impedance Boundary Condition (p. 1522).

Transparent Flow Forcing Parameters

contains the parameters for the transparent flow forcing boundary condition treatment. For details refer to Using the Transparent Flow Forcing Boundary Condition (p. 1530).

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream.

Radiation

contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the mass-flow inlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the mass-flow inlet.

Participates in View Factor Calculation

specifies whether or not the mass-flow inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Scalar Mass Fractions

(partially-premixed combustion FGM model only) allows you to specify the scalar species mass fractions for the transported scalars that you selected in the **Select Transported Scalars** dialog box.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

User Scalar n

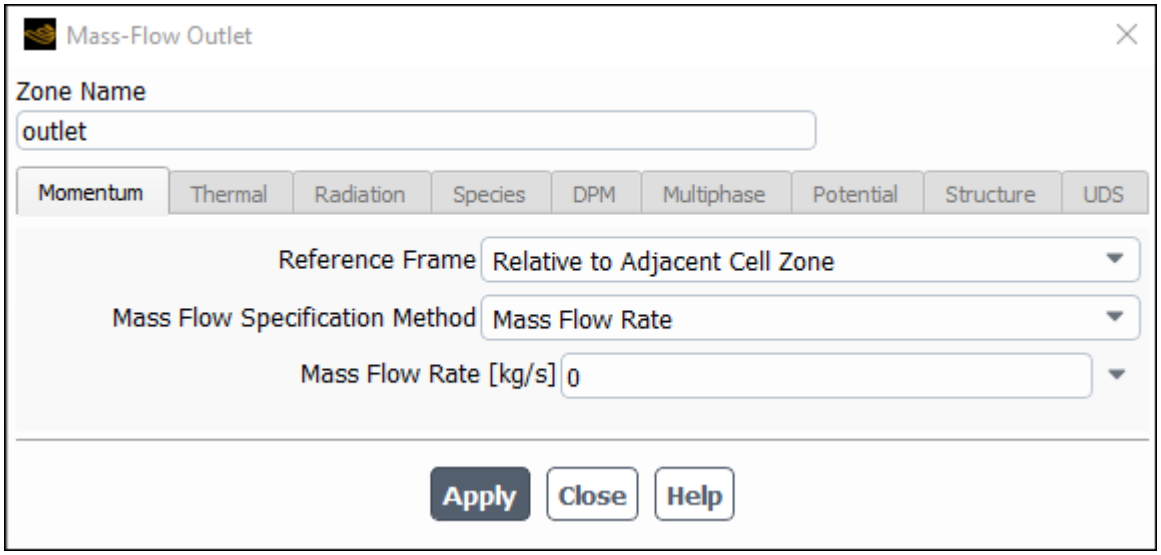
specifies the value of the scalar.

50.7.10. Mass-Flow Outlet Dialog Box

The **Mass-Flow Outlet** dialog box sets the boundary conditions for a mass-flow outlet zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Mass-Flow Outlet Boundaries (p. 1403) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Momentum

displays the momentum boundary conditions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Frame

specifies the reference frame for the mass flow when the cell zone adjacent to the mass-flow outlet is moving. The only available option is **Relative to Adjacent Cell Zone**, so you must define the mass flow relative to the adjacent cell zone.

Mass Flow Specification Method

specifies whether you are defining a **Mass Flow Rate**, **Mass Flux**, **Mass Flux with Average Mass Flux**, or (if the density of the material is defined either as an ideal gas or using a real gas model) **Exit Corrected Mass Flow Rate**.

Mass Flow Rate

sets the prescribed mass flow rate for the zone. This flow rate is converted internally to a prescribed uniform mass flux over the zone by dividing the flow rate by the flow direction area projection of the zone. This item will appear if you selected **Mass Flow Rate** from the **Mass Flow Specification Method** drop-down list.

Important:

Note that for axisymmetric problems, this mass flow rate is the flow rate through the entire (2π-radian) domain, not through a 1-radian slice.

Mass Flux

sets the prescribed mass flux for the zone. This item will appear if you selected **Mass Flux** or **Mass Flux with Average Mass Flux** from the **Mass Flow Specification Method** drop-down list.

Important:

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Average Mass Flux

sets the average mass flux through the zone. For details, see Defining the Mass Flow Rate or Mass Flux (p. 1404). This item will appear if you selected **Mass Flux with Average Mass Flux** from the **Mass Flow Specification Method** drop-down list.

Important:

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Exit Corrected Mass Flow Rate

sets the value for an exit corrected mass flow rate that is maintained by adjusting the mass flow rate to the total conditions at the outlet. The resulting mass flow rate will be proportional to the exit total pressure and inversely proportional to the square root of the exit total tem-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

perature (or equivalently, inversely proportional to the stagnation speed of sound). For details, see Exit Corrected Mass Flow Rate (p. 1407). This item will appear if you selected **Exit Corrected Mass Flow Rate** from the **Mass Flow Specification Method** drop-down list.

Important:

Note that for axisymmetric problems, this mass flow rate is the flow rate through the entire (2π-radian) domain, not through a 1-radian slice.

ECMF Reference Temperature

sets the reference temperature for the exit corrected mass flow rate; for details, see Exit Corrected Mass Flow Rate (p. 1407). Typically, it is set to be the same as the inflow total temperature. This item will appear if you selected **Exit Corrected Mass Flow Rate** from the **Mass Flow Specification Method** drop-down list.

ECMF Reference Gauge Pressure

sets the reference gauge pressure for the exit corrected mass flow rate; for details, see Exit Corrected Mass Flow Rate (p. 1407). Typically, it is set to be the same as the inflow total pressure. This item will appear if you selected **Exit Corrected Mass Flow Rate** from the **Mass Flow Specification Method** drop-down list.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be defined. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X-, Y-, Z-Component of Flow Direction

set the velocity-direction vector of the outflow stream. This vector does not need to be normalized (for example, you can specify the vector (1 1 1) rather than (0.577 0.577 0.577)). These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial-, Tangential-, Axial-Component of Flow Direction

set the velocity-direction vector of the outflow stream. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Axial-, Radial-Component of Flow Direction, Tangential-Velocity

appear for a 3D **Local Cylindrical Swirl** coordinate system.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical (swirl) coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical (swirl) coordinate system.

Radiation

contains the radiation parameters.

External Black Body Temperature Method, Black Body Temperature, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the mass-flow outlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the mass-flow outlet.

Participates in View Factor Calculation

specifies whether or not the mass-flow outlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: “Escape” Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

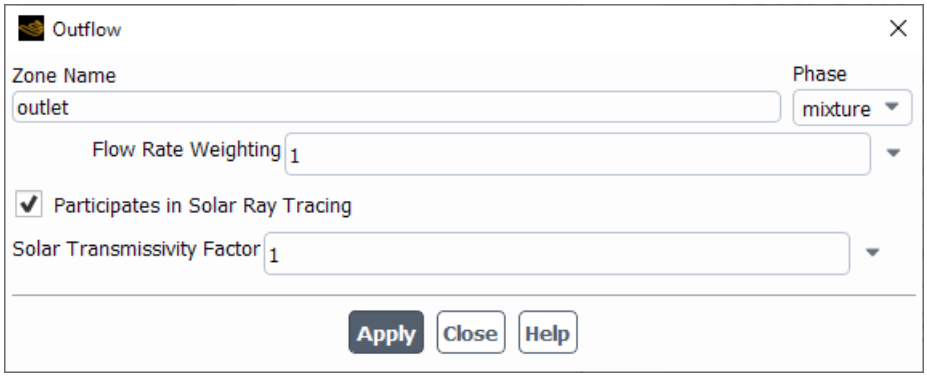
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.11. Outflow Dialog Box

The **Outflow** dialog box sets the boundary conditions for an outflow zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Using Outflow Boundaries (p. 1427) for details about using outflow boundaries.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Flow Rate Weighting

specifies the portion of the outflow that is going through the boundary. See Mass Flow Split Boundary Conditions (p. 1428) for details.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Participates in Solar Ray Tracing

specifies whether or not outflow participate in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outflow.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Participates in View Factor Calculation

specifies whether or not the outflow participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

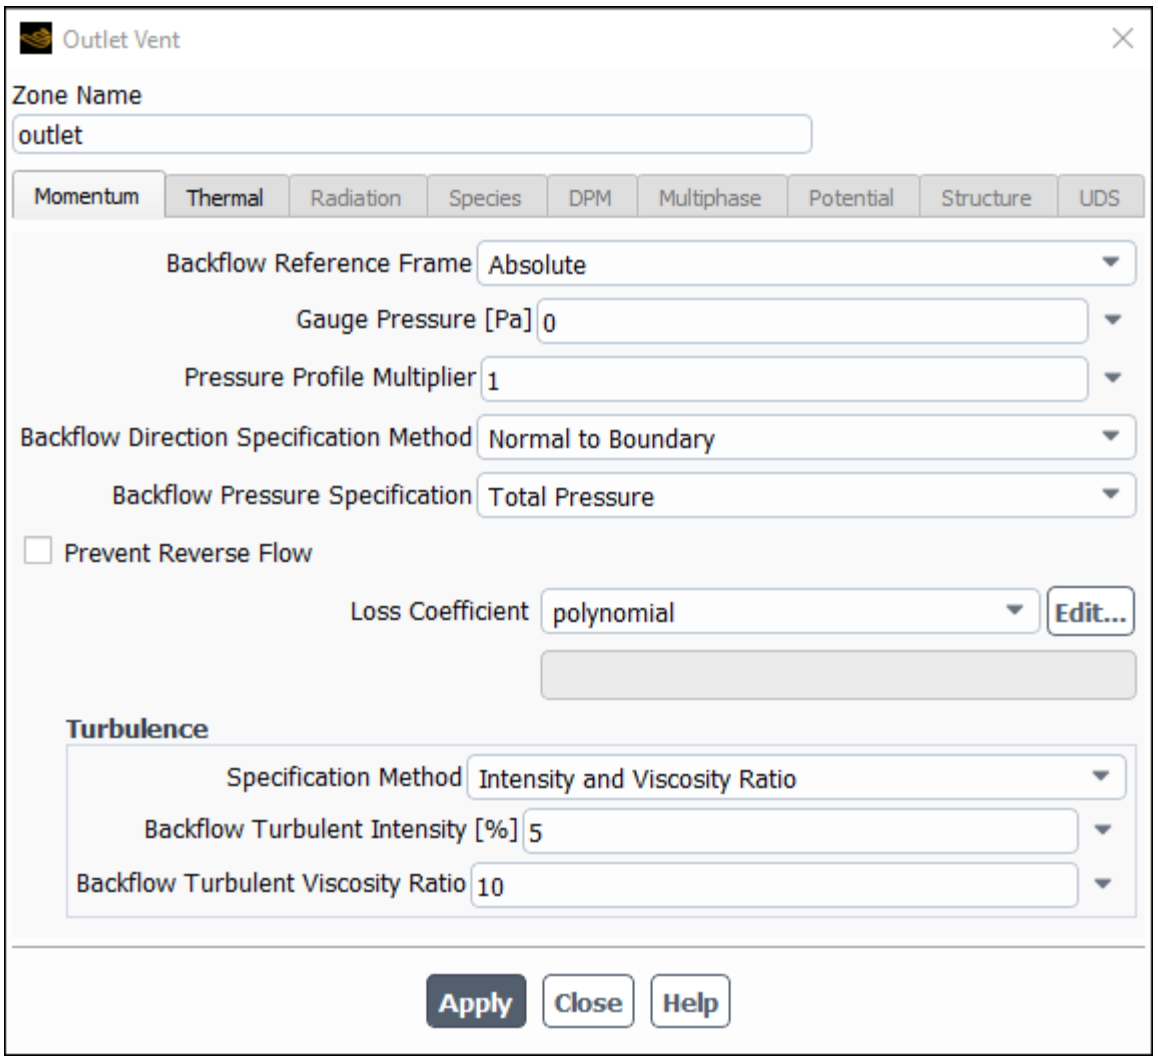
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.12. Outlet Vent Dialog Box

The **Outlet Vent** dialog box sets the boundary conditions for an outlet vent zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Outlet Vent Boundaries (p. 1429) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level..



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Backflow Reference Frame

specify whether backflow temperature, pressure, and flow directions are in the **Absolute** or **Relative to the Adjacent Cell Zone** reference frame.

Gauge Pressure

sets the gauge pressure at the outlet boundary.

Backflow Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** or **From Neighboring Cell** no inputs are required. See Defining the Flow Direction (p. 1383) for information on specifying flow direction.

Coordinate System

contains a drop-down list for selecting the coordinate system. You can choose **Cartesian**, **Cylindrical**, or **Local Cylindrical**. This option is available only when **Direction Vector** is selected from the **Backflow Direction Specification Method** drop-down list.

X-, Y-, Z-Component of Flow Direction

allows you to specify the velocity components in x, y, and z directions respectively. This option is available when **Cartesian** is selected for the **Coordinate System**.

Radial-, Tangential-, Axial-Component of Flow Direction

set the direction of the flow at the boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Backflow Pressure Specification

specifies how the pressure is calculated under backflow conditions. If you select **Static Pressure**, the **Gauge Pressure** is directly imposed as the boundary face pressure; if you select **Total Pressure**, the **Gauge Pressure** will be combined with a dynamic contribution that is based on the velocity in the adjacent cell zone.

Loss-Coefficient

sets the non-dimensional loss coefficient used to compute the pressure drop. See Specifying the Loss Coefficient (p. 1431) for details.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Backflow Modified Turbulent Viscosity

sets the value of the backflow modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Backflow Turbulent Viscosity Ratio

sets the value of the backflow turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

or Turbulent Intensity or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Backflow Total Temperature

sets the total temperature of the inflow stream should the flow reverse direction

Radiation

contains the boundary conditions for the radiation model at the outlet vent.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the outlet vent participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outlet vent.

Participates in View Factor Calculation

specifies whether or not the outlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Backflow Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction Specification Method

sets the method used to specify the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Backflow Volume Fraction

specifies the volume fraction of the secondary phase as a constant, profile, of UDF function.

From Neighboring Cell

calculates the volume fraction from the neighboring cells.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

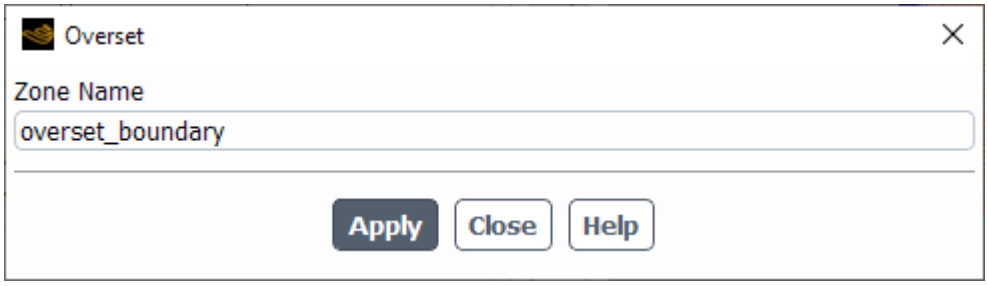
appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

50.7.13. Overset Dialog Box

The **Overset** dialog box sets the boundary conditions for an overset zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Setting up an Overset Interface (p. 1204) for further details.



Controls

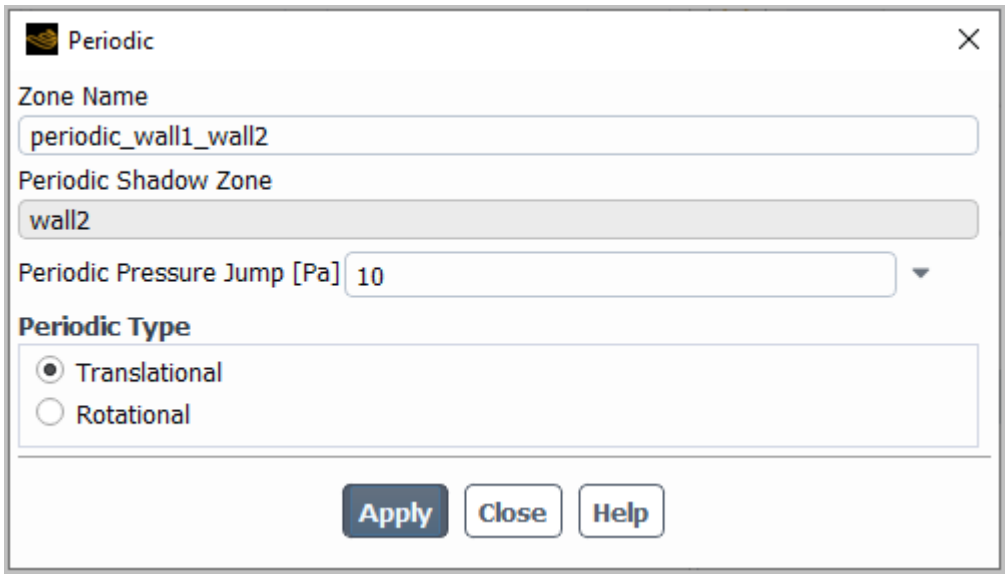
Zone Name

sets the name of the zone.

50.7.14. Periodic Dialog Box

The **Periodic** dialog box sets the boundary conditions for a periodic zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs for Periodic Boundaries (p. 1477) for details about the items below. See Periodic Flows (p. 1719) for information about fully-developed periodic flow.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Periodic Type

indicates whether the periodicity of the domain is **Translational** or **Rotational**.

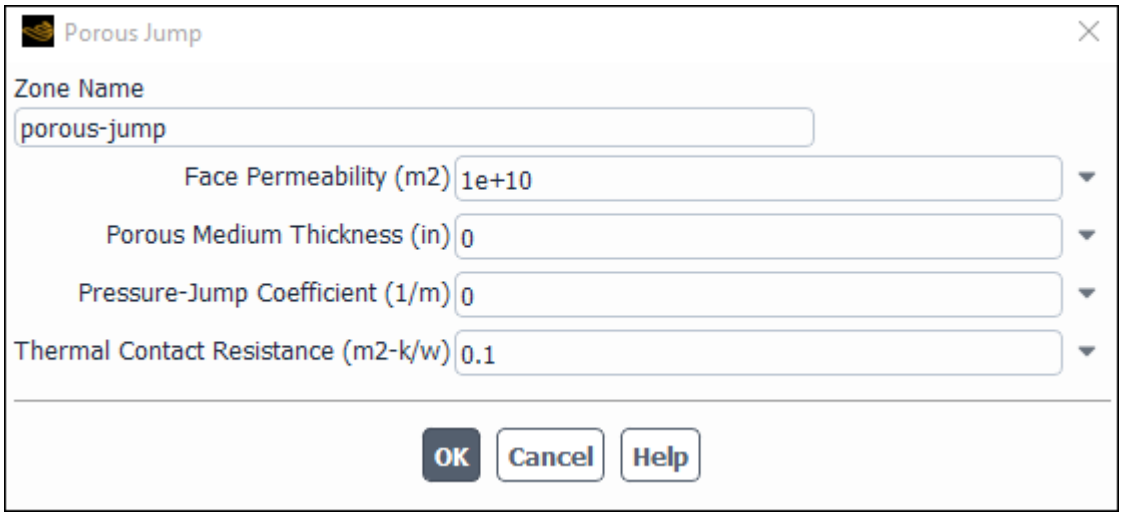
Periodic Pressure Jump

sets the pressure increase/decrease across the periodic boundary. (This item will not appear if the pressure-based (default) solver is used; it is relevant only for the density-based solvers.)

50.7.15. Porous Jump Dialog Box

The **Porous Jump** dialog box sets the boundary conditions for a porous-jump zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Porous Jump Boundary Conditions (p. 1495) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Face Permeability

sets the face permeability coefficient (α in Equation 7.147 (p. 1495)).

Porous Medium Thickness

sets the thickness of the porous medium (Δm).

Pressure-Jump Coefficient

sets the pressure-jump coefficient (C_2).

Thermal Contact Resistance

sets the thermal contact resistance.

Jump Adhesion

sets the adhesion method and contact angle.

Constrained-Two-Sided Adhesion

constrains the contact angle at the porous jump, When this option is disabled then the forced two-sided adhesion treatment is in effect. See Jump Adhesion for more information.

Contact Angle

is the contact angle at the porous jump.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

interior

allows the particles to pass through the boundary.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Solar Boundary Conditions

contains the settings for solar ray tracing. This group box is available only if you select **Solar Ray Tracing** from the **Model** list in the **Solar Load** group box of the **Radiation Model** dialog box. See Solar Ray Tracing (p. 2225) for details.

Participates in Solar Ray Tracing

specifies whether or not the porous jump participates in solar ray tracing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Absorptivity

contains the settings that define the absorptivity of the porous jump.

Direct Visible

specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Direct IR

specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Transmissivity

contains the settings that define the transmissivity of the porous jump.

Direct Visible

specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

Direct IR

specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

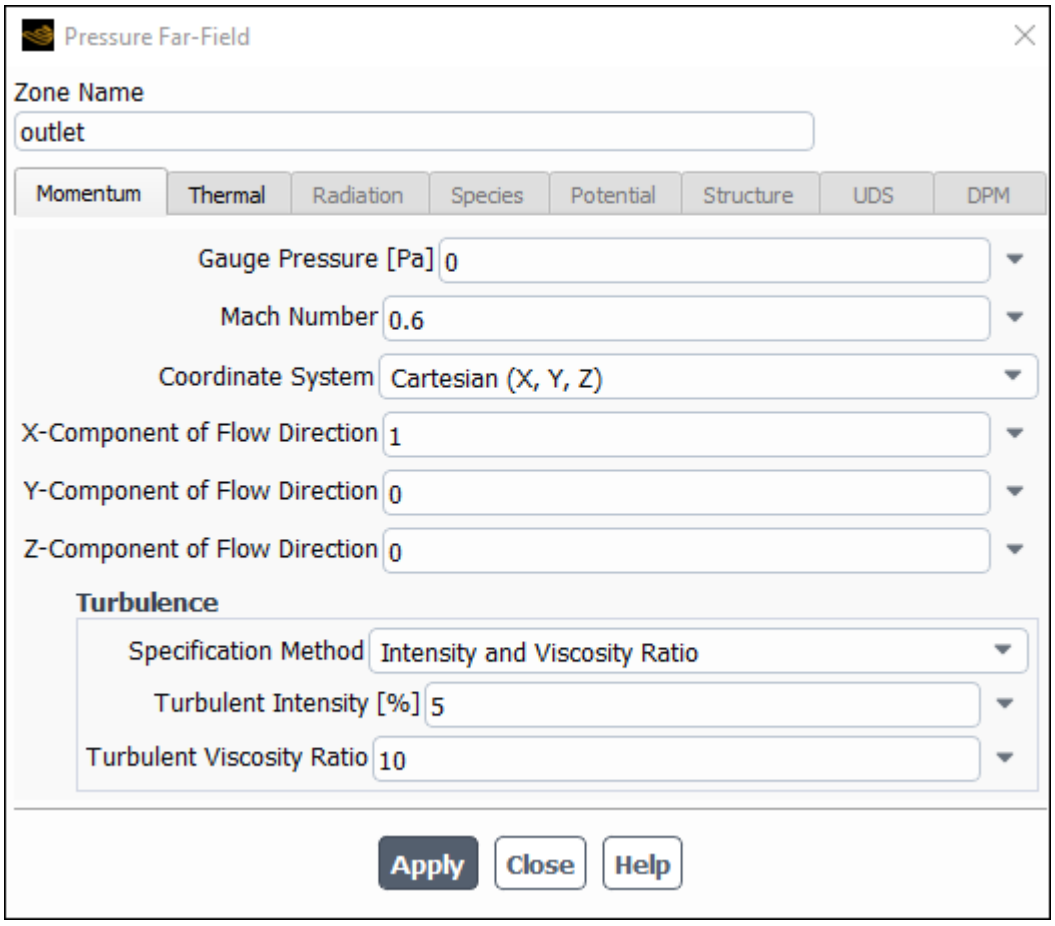
50.7.16. Pressure Far-Field Dialog Box

The **Pressure Far-Field** dialog box sets the boundary conditions for a pressure far-field zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Pressure Far-Field Boundaries (p. 1422) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Gauge Pressure

sets the far-field gauge static pressure.

Mach Number

sets the far-field Mach number. The Mach number can be subsonic, sonic, or supersonic.

Coordinate System

allows you to select a **Cartesian**, **Cylindrical**, or **Local Cylindrical** coordinate system. This option is available only for 3D geometry.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X-, Y-, Z-Component of Flow Direction

set the far-field flow direction. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial-, Tangential-, Axial-Component of Flow Direction

set the far-field flow direction. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Turbulence Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Temperature

sets the far-field static temperature.

Radiation

contains the boundary conditions for the radiation model at the pressure far-field zone.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the pressure far-field zone participates in solar ray tracing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure far-field zone.

Participates in View Factor Calculation

specifies whether or not the pressure far-field zone participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: “Trap” Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: “Escape” Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

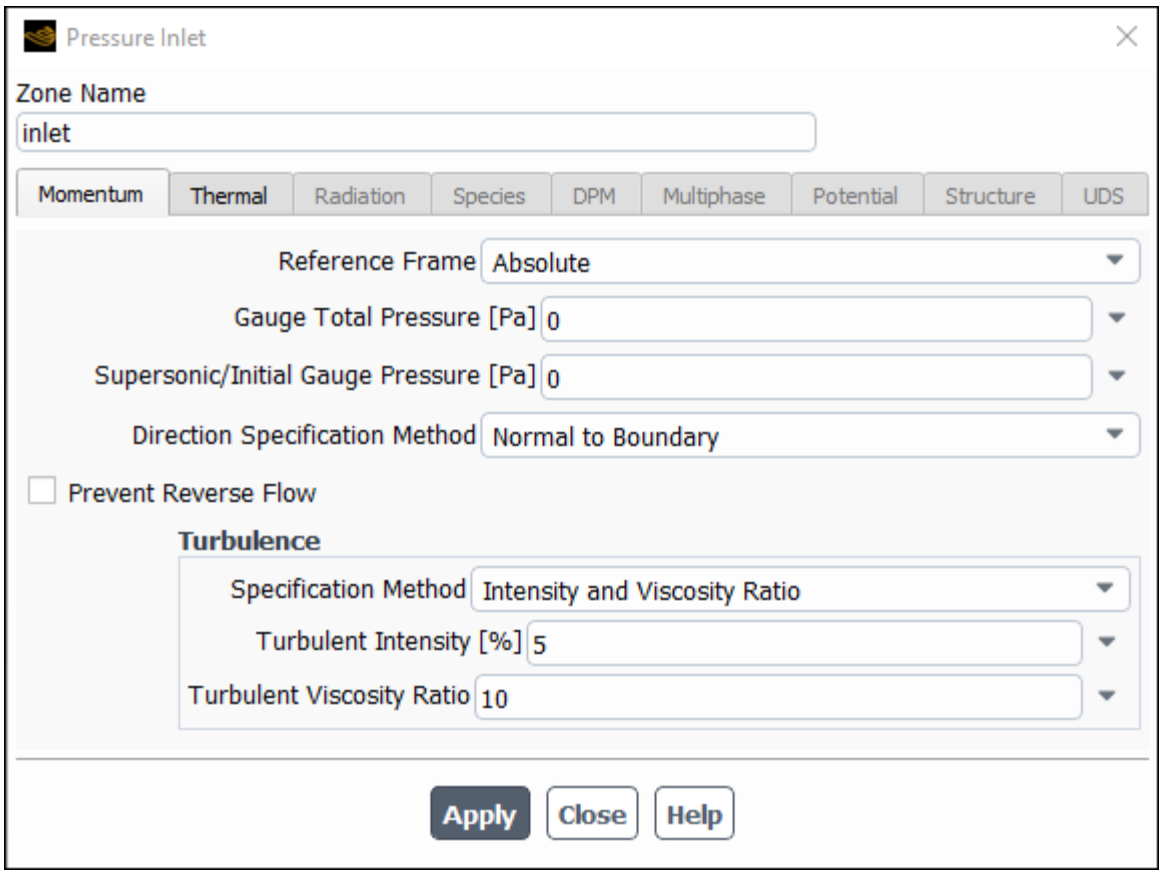
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.17. Pressure Inlet Dialog Box

The **Pressure Inlet** dialog box sets the boundary conditions for a pressure inlet zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Pressure Inlet Boundaries (p. 1380) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the pressure inlet. If the cell zone adjacent to the pressure inlet is moving, you can choose to specify the total temperature, total pressure, and velocity

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

components as **Relative to Adjacent CellZone** or **Absolute** in the **Reference Frame** drop-down list.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the pressure inlet boundary condition is selected for computing initial values (see Initializing the Entire Flow Field Using Standard Initialization (p. 3614)).

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. You also have the option to enable **Prevent Reverse Flow**. See Defining the Flow Direction (p. 1383) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be defined. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Radial-, Axial-Component of Flow Direction, Tangential-Velocity

appear for a 3D **Local Cylindrical Swirl** coordinate system.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical (swirl) coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical (swirl) coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Prevent Reverse Flow

Enables Fluent to erect artificial walls on the boundary mesh faces to prevent flow out of the domain. The artificial walls are removed when the flow is no longer leaving the domain and when a favorable pressure gradient is recovered at the boundary mesh faces.

Fluctuating Velocity

contains parameters for Inlet Boundary Conditions for Scale Resolving Simulations (only available for transient cases where scale-resolving turbulence models such as SAS, DES, and LES are enabled).

Fluctuating Velocity Algorithm

Specifies which method will be used for generating fluctuations at the boundary for Scale Resolving Simulations. The following methods are available:

No Perturbations

No fluctuations added.

Vortex Method

For details, see Vortex Method in the *Fluent Theory Guide*.

Spectral Synthesizer

For details, see Spectral Synthesizer in the *Fluent Theory Guide*.

Synthetic Turbulence Generator

For details, see Synthetic Turbulence Generator in the *Fluent Theory Guide*.

Number of Vortices

Specifies number of vortices to be generated with the **Vortex Method**.

Satisfy Mass Conservation?

Enables mass conservation for the **Vortex Method** at the boundary.

Scale Search Limiter

Specifies which method will be used to limit the area from where global scales for the **Synthetic Turbulence Generator** are computed. The following methods are available:

None

Scales are computed using the entire inlet zone.

Turbulent Intensity Threshold

Scales are computed using only part of the inlet zone where Turbulent Intensity is higher than specified threshold value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Viscosity Ratio Threshold

Scales are computed using only part of the inlet zone where Turbulent Viscosity Ratio is higher than specified threshold value.

Wall Distance Threshold

Scales are computed using only part of the inlet zone where Wall Distance is smaller than specified threshold value.

Turbulent Intensity, Turbulent Viscosity Ratio, or Wall Distance

Specifies threshold value for the corresponding **Scale Search Limiter** (only available for the **Synthetic Turbulence Generator** with corresponding **Scale Search Limiter** chosen).

Volumetric Forcing?

Enables generation of fluctuations in the volume adjacent to the inlet boundary instead of introduction of fluctuations directly at the boundary (only available for the **Synthetic Turbulence Generator**).

Forcing Zone Thickness

Specifies which method will be used to set up the streamwise size of the volume where fluctuations are to be generated (only available for the **Synthetic Turbulence Generator** with **Volumetric Forcing?** enabled). The following methods are available:

Automatic

Length is computed based on the turbulent length scale computed from the boundary.

Specified Value

Length is specified by the user.

Thickness

Specifies the streamwise size of the volume where fluctuations are to be generated (only available for the **Synthetic Turbulence Generator** with **Volumetric Forcing?** enabled if **Specified Value** option is chosen for **Forcing Zone Thickness**).

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Acoustic Wave Model

contains settings for treatment of acoustic pressure waves at the boundary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Off

disables special treatment of acoustic pressure waves at the boundary.

Non Reflecting

enables the general non-reflecting boundary condition treatment described in General Non-Reflecting Boundary Conditions (p. 1514).

Impedance

enables the impedance boundary condition treatment described in Impedance Boundary Conditions (p. 1521).

Transparent Flow Forcing

enables the transparent flow forcing boundary condition described in Transparent Flow Forcing Boundary Conditions (p. 1530).

Impedance Parameters

contains the parameters for the impedance boundary condition treatment. For details refer to Using the Impedance Boundary Condition (p. 1522).

Transparent Flow Forcing Parameters

contains the parameters for the transparent flow forcing boundary condition treatment. For details refer to Using the Transparent Flow Forcing Boundary Condition (p. 1530).

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream. If you are using moving reference frames, see Defining Total Pressure and Temperature (p. 1382) for information about relative and absolute total temperature.

Radiation

contains the boundary conditions for the radiation model at the pressure inlet.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the pressure inlet participates in solar ray tracing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure inlet.

Participates in View Factor Calculation

specifies whether or not the pressure inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Scalar Mass Fractions

(partially-premixed combustion FGM model only) allows you to specify the scalar species mass fractions for the transported scalars that you selected in the **Select Transported Scalars** dialog box.

DPM

contains the discrete phase parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: “Trap” Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: “Escape” Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Volume Fraction

specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

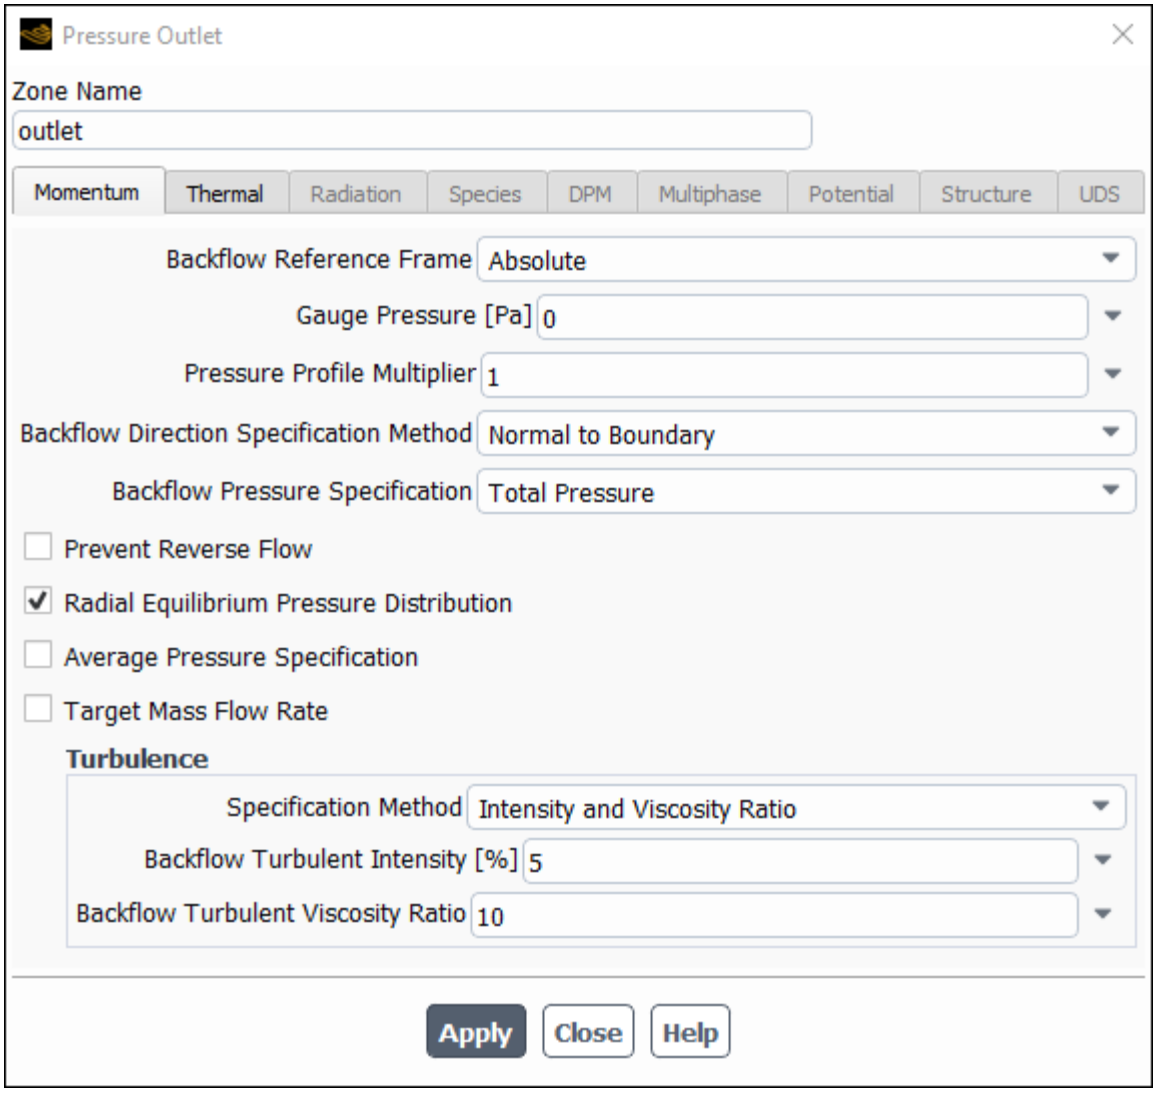
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.18. Pressure Outlet Dialog Box

The **Pressure Outlet** dialog box sets the boundary conditions for a pressure outlet zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Pressure Outlet Boundaries (p. 1412) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Momentum

contains the momentum parameters.

Backflow Reference Frame

specify whether backflow temperature, pressure, and flow directions are in the **Absolute** or **Relative to the Adjacent Cell Zone** reference frame.

Gauge Pressure

sets the gauge pressure at the outflow boundary.

Pressure Profile Multiplier

sets a factor by which the **Gauge Pressure** is multiplied. This is provided mainly for cases where a non-uniform distribution of the static pressure at the pressure outlet boundary is specified by means of a profile file or a user-defined function.

Backflow Direction Specification Method

sets the direction of the inflow stream should the flow reverse direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** or **From Neighboring Cell**, no inputs are required. You also have the option to enable **Prevent Reverse Flow**. See Inputs at Pressure Outlet Boundaries (p. 1412) for information on specifying flow direction.

Coordinate System

contains a drop-down list for selecting the coordinate system. You can choose **Cartesian**, **Cylindrical**, or **Local Cylindrical**. This option is available only when **Direction Vector** is selected from the **Backflow Direction Specification Method** drop-down list.

X-, Y-, Z-Component of Flow Direction

allows you to specify the velocity components in x, y, and z directions respectively. This option is available when **Cartesian** is selected for the **Coordinate System**.

Radial-, Tangential-, Axial-Component of Flow Direction

set the direction of the flow at the boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Backflow Pressure Specification

specifies how the pressure is calculated under backflow conditions. When the NRBC option is not enabled, if you select **Static Pressure**, the **Gauge Pressure** is directly imposed as the boundary face pressure; if you select **Total Pressure**, the **Gauge Pressure** will be combined with a dynamic contribution that is based on the velocity in the adjacent cell zone. For NRBCs, if you select **Static Pressure**, the **Gauge Pressure** is directly imposed as the pressure at infinity; if you select **Total Pressure**, the pressure at infinity is a calculated value that is based on the **Gauge Pressure**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Radial Equilibrium Pressure Distribution

enables the radial equilibrium pressure distribution. See Defining Static Pressure (p. 1414) for details.

This item appears only for 3D and axisymmetric swirl solvers.

Average Pressure Specification

allows the pressure along the outlet boundary to vary, but maintain an average equivalent to the specified value in the **Gauge Pressure** input field. In this boundary implementation, the pressure variation provides a low level of non-reflectivity. For more details, see Calculation Procedure at Pressure Outlet Boundaries (p. 1417).

Note:

The **Average Pressure Specification** option is not available if the **Radial Equilibrium Pressure Distribution** option is enabled.

Target Mass Flow Rate

allows you to set mass flow rate as a boundary condition at the outlet.

Target Mass Flow

allows you to specify the flow as either a constant value or a user-defined function.

Upper Limit of Absolute Pressure, Lower Limit of Absolute Pressure

specifies the range of the pressure limits, which have different pressure variations on different boundaries. The upper and lower pressure limits can be specified as a constant or a profile.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Backflow Modified Turbulent Viscosity

sets the value of the backflow modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Backflow Turbulent Viscosity Ratio

sets the value of the backflow turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Acoustic Wave Model

contains settings for treatment of acoustic pressure waves at the boundary.

Off

disables special treatment of acoustic pressure waves at the boundary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Non Reflecting

enables the general non-reflecting boundary condition treatment described in General Non-Reflecting Boundary Conditions (p. 1514).

Impedance

enables the impedance boundary condition treatment described in Impedance Boundary Conditions (p. 1521).

Transparent Flow Forcing

enables the transparent flow forcing boundary condition described in Transparent Flow Forcing Boundary Conditions (p. 1530).

Non Reflecting Parameters

contains settings for the non-reflecting boundary condition treatment.

Exit Pressure Specification

defines how the pressure is calculated. For **Pressure at Infinity**, the pressure at the boundary relaxes toward the **Gauge Pressure** at infinity; for **Average Boundary Pressure**, an effort is made to force the average pressure on the boundary to approach the **Gauge Pressure** value.

Impedance Parameters

contains the parameters for the impedance boundary condition treatment. For details refer to Using the Impedance Boundary Condition (p. 1522).

Transparent Flow Forcing Parameters

contains the parameters for the transparent flow forcing boundary condition treatment. For details refer to Using the Transparent Flow Forcing Boundary Condition (p. 1530).

Thermal

contains the thermal parameters.

Backflow Total Temperature

sets the total temperature of the inflow stream should the flow reverse direction

Radiation

contains the boundary conditions for the radiation model at the pressure outlet.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Participates in Solar Ray Tracing

specifies whether or not the pressure outlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure outlet.

Participates in View Factor Calculation

specifies whether or not the pressure outlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Scalar Mass Fractions

(partially-premixed combustion FGM model only) allows you to specify the scalar species mass fractions for the transported scalars that you selected in the **Select Transported Scalars** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles. This option is available only for a granular phase with the Mixture and Eulerian multiphase models.

Volume Fraction Specification Method

sets the method used to specify the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details. This control is not available for the open channel VOF submodel.

Backflow Volume Fraction

specifies the volume fraction of the secondary phase as a constant, profile, of UDF function.

From Neighboring Cell

calculates the volume fraction from the neighboring cells.

Open Channel

(VOF model only) enables the open-channel flow boundary condition. See Modeling Open Channel Flows (p. 2975) for more information. This option is available only when the **Open Channel** VOF submodel is selected in the **Multiphase Model** dialog box. Once you select this option, you can specify the following conditions:

Outlet Group ID

is used to identify the different outlets that are part of the same outlet group. See Setting the Outlet Group (p. 2978) for details.

Pressure Specification Method

specifies which method will be used to define the boundary conditions at the open-channel pressure outlet. You can choose from the following options:

- **Free Surface Level**
- **From Neighboring Cell**
- **Gauge Pressure**

Refer to Pressure Outlet in the *Fluent Theory Guide* for more details.

Secondary Phase for Level Specification

allows you to choose the desired secondary phase. This control is available only for flow applications with more than two phases.

Free Surface Level

can be determined by using the absolute value of height from the free surface to the origin in the direction of gravity and applying the correct sign based on whether the free surface level is above (positive) or below (negative) the origin. See Determining the Free Surface Level (p. 2978) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bottom Level

is used for calculating the liquid height. It can be determined as described in Determining the Bottom Level (p. 2979).

Density Interpolation Method

allows you to specify whether the mixture density used in the hydrostatic profile will be interpolated using the **From Neighboring Cell**, **From Free Surface Level**, or **Hybrid** method. See Choosing the Density Interpolation Method (p. 2982) for more information. This drop-down list is available for sub-critical two-phase flow applications.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

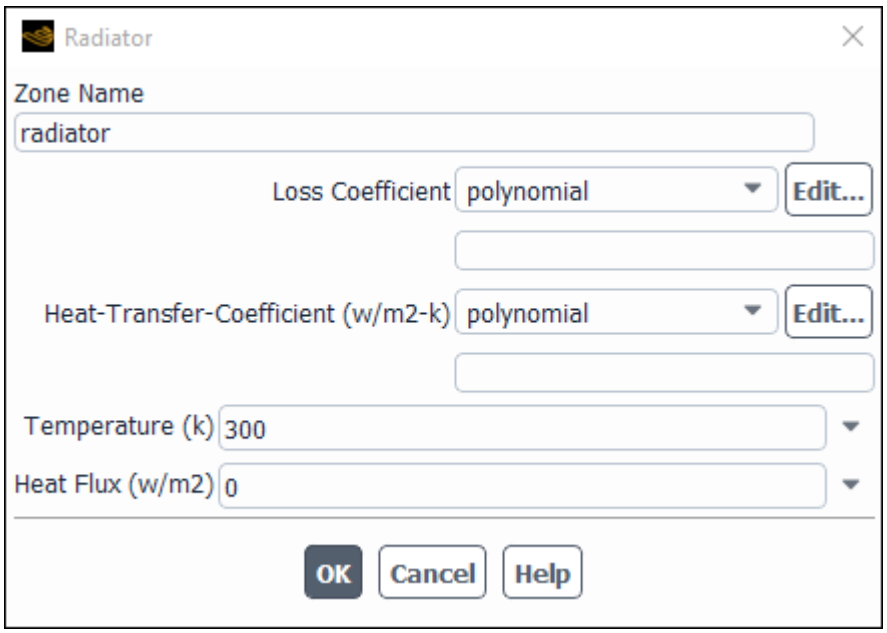
User Scalar n

specifies the value of the scalar.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.19. Radiator Dialog Box

The **Radiator** dialog box sets the boundary conditions for a radiator model zone. It is opened from the Boundary Conditions Task Page (p. 4937). See User Inputs for Radiators (p. 1489) for details about the items below.



Controls

Zone Name

sets the name of the zone.

Loss Coefficient

specifies the loss coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See Defining the Pressure Loss Coefficient Function (p. 1490) for details.

Heat-Transfer-Coefficient

specifies the heat-transfer coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See Defining the Heat Flux Parameters (p. 1493) for details.

Temperature

sets the temperature used to compute heat flux from the radiator using the **Heat-Transfer-Coefficient**. If **Temperature** is absolute zero, the **Heat Flux** condition is used instead.

Heat Flux

sets the heat flux at the radiator surface (used only when **Temperature** is absolute zero).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior

allows the particles to pass through the boundary.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

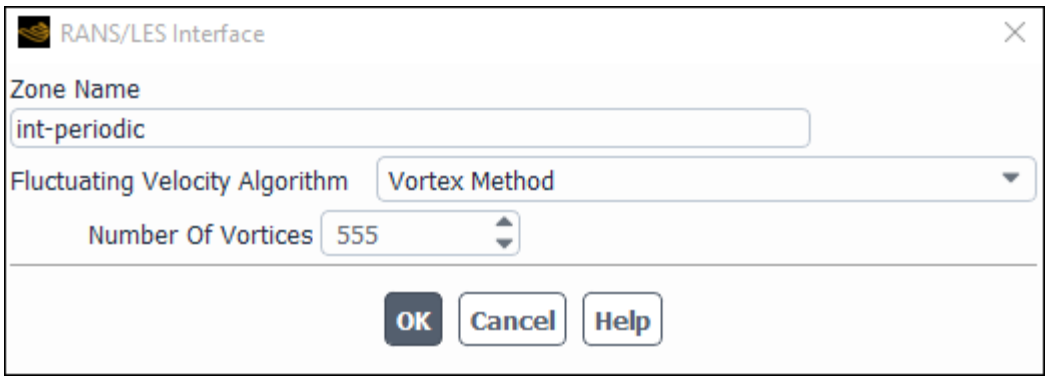
sets the user-defined function from the drop-down list.

50.7.20. RANS/LES Interface Dialog Box

The **RANS/LES Interface** dialog box can be used to create artificial resolved turbulence (fluctuation/perturbations) at the interface where the flow proceeds from the RANS zone into the LES zone of the computational domain for Embedded LES turbulent flows. It is opened from the Boundary Conditions

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Task Page (p. 4937). See Setting Up the Embedded Large Eddy Simulation (ELES) Model (p. 2088) for more information about RANS/LES interfaces.



Controls

Zone Name

sets the name of the RANS/LES interface.

Fluctuating Velocity Algorithm

displays the methods for generating fluctuating velocity components at the RANS/LES interface. Available options include:

- No Perturbations
- Spectral Synthesizer
- Vortex Method

Number of Vortices

displays the amount of vortices that the selected fluctuating velocity method distributes randomly over the face zone and uses to generate turbulent fluctuations (available for the Vortex Method only).

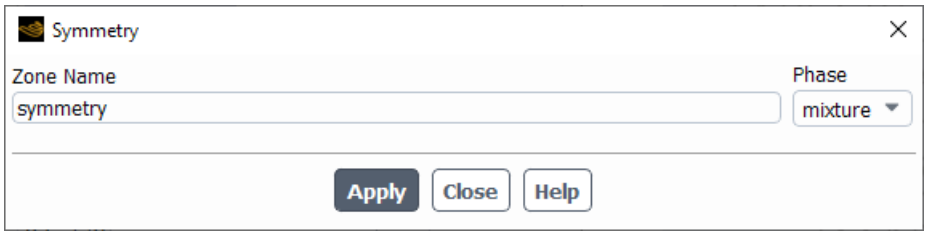
Important:

The RANS/LES 'interface' can either be an interior zone (that has been assigned to be a **rans-les-interface** zone), or it can be a non-conformal interface. If it is a non-conformal interface, then you need to identify the name of the non-conformal interface's "interior" zone (for example, using the **List** button in the Mesh Interfaces Dialog Box (p. 5468)), and then go to that zone in the **Boundary Conditions** task page.

50.7.21. Symmetry Dialog Box

The **Symmetry** dialog box can be used to modify the name of a symmetry zone; there are no conditions to be set. It is opened from the Boundary Conditions Task Page (p. 4937). See Symmetry Boundary Conditions (p. 1474) for information about symmetry boundaries.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. This item is available only for multiphase flows.

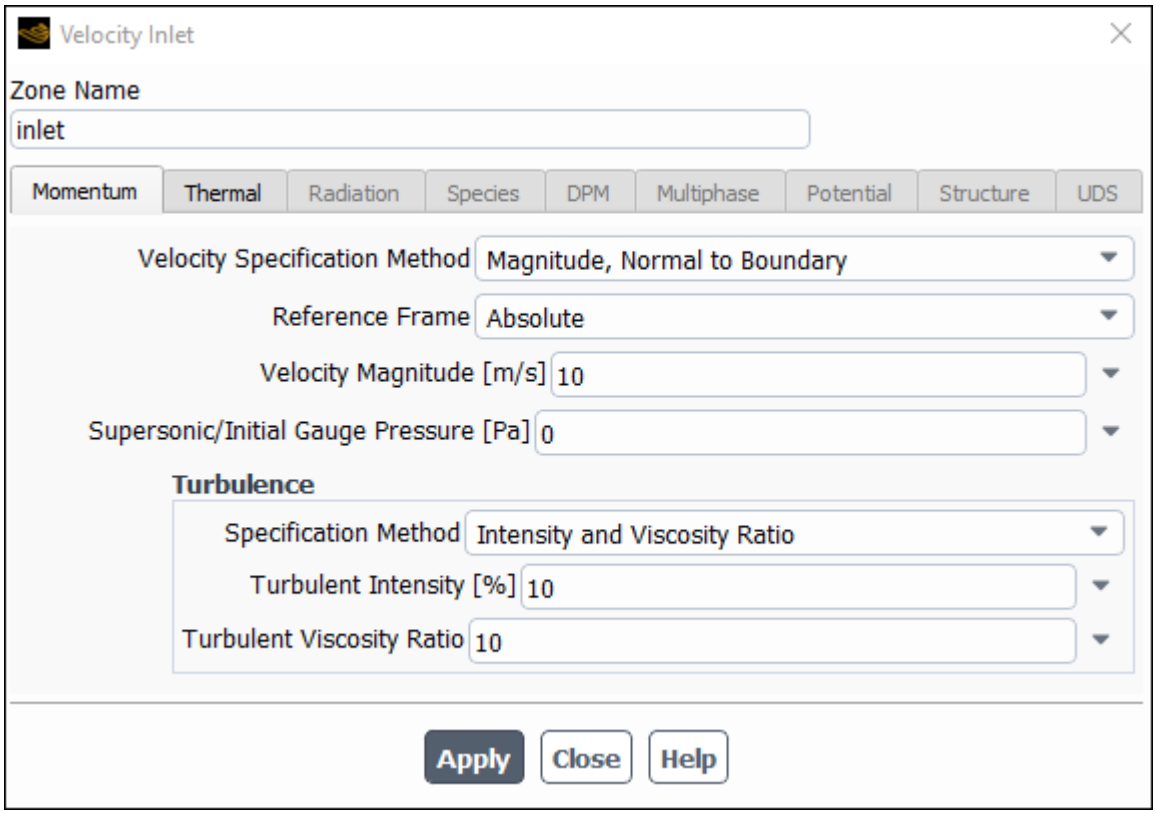
50.7.22. Velocity Inlet Dialog Box

The **Velocity Inlet** dialog box sets the boundary conditions for a velocity inlet zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Velocity Inlet Boundaries (p. 1389) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Open Channel Wave BC

allows you to set specific parameters for a particular boundary for open channel wave boundaries. This is available when the volume of fluid multiphase model is selected.

Momentum

contains the momentum parameters.

Velocity Specification Method

sets the method used to define the inflow velocity.

Flow Direction Specification Method

sets the method used to define the direction of flow of the wave. This is available when you enable the **Open Channel Wave BC** option.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Magnitude and Direction

allows specification in terms of a **Velocity Magnitude** and **Flow-Direction**.

Components

allows specification in terms of the Cartesian, cylindrical, or local cylindrical velocity components.

Magnitude, Normal to Boundary

allows specification of a **Velocity Magnitude** normal to the boundary.

Reference Frame

specifies relative or absolute velocity inputs. You can choose to enter **Absolute** velocities or velocities **Relative to Adjacent Cell Zone**. If you are not using moving reference frames, both options are equivalent, so you need not choose.

Uniform Flow Velocity Magnitude

is the flow velocity, specified as a constant or a parameter.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, or **Local Cylindrical** velocities will be defined. This item will appear only for 3D cases in which you have selected **Magnitude and Direction** or **Components** as the **Velocity Specification Method**.

X-, Y-, Z-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models, or for 3D models if you select the **Components** option as the **Velocity Specification Method** and **Cartesian** as the **Coordinate System**.

Radial-, Tangential-, Axial-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 3D models if you select the **Components** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**.

Axial-, Radial-, Swirl-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 2D axisymmetric models.

Important:

Swirl-Velocity will appear only for 2D axisymmetric swirl models.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Angular Velocity

specifies the angular velocity Ω for a 3D flow. This item will appear for a 3D model if you select the **Components** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**.

Swirl Angular Velocity

specifies the swirl angular velocity Ω for an axisymmetric swirling flow. This item will appear for an axisymmetric swirl model if you choose **Components** as the **Velocity Specification Method**.

Velocity Magnitude

sets the magnitude of the velocity vector at the inflow boundary. This item will appear if you select the **Magnitude and Direction** or **Magnitude, Normal to Boundary** option as the **Velocity Specification Method**.

X-, Y-, Z-Component of Flow Direction

set the direction of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models if you select the **Magnitude and Direction** option as the **Velocity Specification Method**, or for 3D models if you select the **Magnitude and Direction** option as the **Velocity Specification Method** and **Cartesian** as the **Coordinate System**.

Radial-, Tangential-, Axial-Component of Flow Direction

set the direction of the velocity vector at the inlet boundary. These items will appear for 3D models if you select the **Magnitude and Direction** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**, or for 2D axisymmetric models.

Important:

Tangential-Velocity will appear only for 2D axisymmetric swirl models.

Axis Origin

sets the **X**, **Y**, and **Z** coordinates of the origin of the local cylindrical coordinate system.

Axis Direction

sets the **X**, **Y**, and **Z** components of the direction of the local cylindrical coordinate system.

Outflow Gauge Pressure

specifies the pressure to be used as the pressure outlet condition if flow exits the domain at any face on the velocity inlet boundary. (Note that this effect is similar to that of the "velocity far-field" boundary that was available in RAMPANT 3.)

This item appears only for the density-based solvers.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fluctuating Velocity

contains parameters for Inlet Boundary Conditions for Scale Resolving Simulations (only available for transient cases where scale-resolving turbulence models such as SAS, DES, and LES are enabled).

Fluctuating Velocity Algorithm

Specifies which method will be used for generating fluctuations at the boundary for Scale Resolving Simulations. The following methods are available:

No Perturbations

No fluctuations added.

Vortex Method

For details, see Vortex Method in the *Fluent Theory Guide*.

Spectral Synthesizer

For details, see Spectral Synthesizer in the *Fluent Theory Guide*.

Synthetic Turbulence Generator

For details, see Synthetic Turbulence Generator in the *Fluent Theory Guide*.

Number of Vortices

Specifies number of vortices to be generated with the **Vortex Method**.

Satisfy Mass Conservation?

Enables mass conservation for the **Vortex Method** at the boundary.

Scale Search Limiter

Specifies which method will be used to limit the area from where global scales for the **Synthetic Turbulence Generator** are computed. The following methods are available:

None

Scales are computed using the entire inlet zone.

Turbulent Intensity Threshold

Scales are computed using only part of the inlet zone where Turbulent Intensity is higher than specified threshold value.

Turbulent Viscosity Ratio Threshold

Scales are computed using only part of the inlet zone where Turbulent Viscosity Ratio is higher than specified threshold value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Wall Distance Threshold

Scales are computed using only part of the inlet zone where Wall Distance is smaller than specified threshold value.

Turbulent Intensity, Turbulent Viscosity Ratio, or Wall Distance

Specifies threshold value for the corresponding **Scale Search Limiter** (only available for the **Synthetic Turbulence Generator** with corresponding **Scale Search Limiter** chosen).

Volumetric Forcing?

Enables generation of fluctuations in the volume adjacent to the inlet boundary instead of introduction of fluctuations directly at the boundary (only available for the **Synthetic Turbulence Generator**).

Forcing Zone Thickness

Specifies which method will be used to set up the streamwise size of the volume where fluctuations are to be generated (only available for the **Synthetic Turbulence Generator** with **Volumetric Forcing?** enabled). The following methods are available:

Automatic

Length is computed based on the turbulent length scale computed from the boundary.

Specified Value

Length is specified by the user.

Thickness

Specifies the streamwise size of the volume where fluctuations are to be generated (only available for the **Synthetic Turbulence Generator** with **Volumetric Forcing?** enabled if **Specified Value** option is chosen for **Forcing Zone Thickness**).

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to define the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, **Modified Turbulent Viscosity** (Spalart-Allmaras model only), or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See Determining Turbulence Parameters (p. 1373) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t / μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Modified Turbulent Viscosity

sets the value of the modified turbulent viscosity $\tilde{\nu}$. This item will appear if you choose **Modified Turbulent Viscosity** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t / μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity

sets the value of the turbulence intensity I for the LES model.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, Ansys Fluent will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See Reynolds Stress Model (p. 2108) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Acoustic Wave Model

contains settings for treatment of acoustic pressure waves at the boundary.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Off

disables special treatment of acoustic pressure waves at the boundary.

Non Reflecting

enables the general non-reflecting boundary condition treatment described in General Non-Reflecting Boundary Conditions (p. 1514).

Impedance

enables the impedance boundary condition treatment described in Impedance Boundary Conditions (p. 1521).

Transparent Flow Forcing

enables the transparent flow forcing boundary condition described in Transparent Flow Forcing Boundary Conditions (p. 1530).

Impedance Parameters

contains the parameters for the impedance boundary condition treatment. For details refer to Using the Impedance Boundary Condition (p. 1522).

Transparent Flow Forcing Parameters

contains the parameters for the transparent flow forcing boundary condition treatment. For details refer to Using the Transparent Flow Forcing Boundary Condition (p. 1530).

Thermal

contains the thermal parameters.

Temperature

specifies the static temperature of the flow.

Radiation

contains the boundary conditions for the radiation model at the velocity inlet.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1, DTRM, DO, S2S, or MC models for radiation heat transfer. See Defining Boundary Conditions for Radiation (p. 2181) for details.

Participates in Solar Ray Tracing

specifies whether or not the velocity inlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the velocity inlet.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Participates in View Factor Calculation

specifies whether or not the velocity inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See Defining Cell Zone and Boundary Conditions for Species (p. 2392) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. These items will appear only if you are using the non-premixed or partially premixed combustion model.

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See Setting Boundary Conditions for the Progress Variable (p. 2539) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Scalar Mass Fractions

(partially-premixed combustion FGM model only) allows you to specify the scalar species mass fractions for the transported scalars that you selected in the **Select Transported Scalars** dialog box.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See Particle Reflection at Wall in the *Fluent Theory Guide*.)

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Volume Fraction

specifies the volume fraction of the secondary phase selected in the Boundary Conditions Task Page (p. 4937). This section of the dialog box will appear when one of the multiphase models is being used. See Defining Multiphase Cell Zone and Boundary Conditions (p. 2953) for details.

Secondary Phase for Inlet

specifies the secondary phase to which the parameters are applied. In case of a three-phase flow, select the corresponding secondary phase from this list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Wave BC Options

allows you to choose between **Shallow Waves**, **Shallow/Intermediate Waves** or **Short Gravity Waves**. Information about the two types of waves is available in Open Channel Wave Boundary Conditions in the Theory Guide.

Free Surface Level

is determined by using the absolute value of height from the free surface to the origin in the direction of gravity and applying the correct sign based on whether the free surface level is above (positive) or below (negative) the origin.

Bottom Level

is valid for shallow and intermediate waves. The bottom level is used for calculating the liquid height.

Reference Wave Direction

is the direction of wave propagation for a zero wave heading angle.

Wave Modeling Options

determines whether to use wave theory or a wave spectrum to model waves in the shallow/intermediate and short gravity wave regimes.

Number of Waves

specifies the number of waves you are defining when modeling waves using wave theory.

Wave Theory

allows you to choose from **First Order Airy** (the default), **Second Order Stokes**, **Third Order Stokes**, **Fourth Order Stokes**, and **Fifth Order Stokes** for shallow/intermediate waves and short gravity waves. For shallow waves, you can choose between **Fifth Order Solitary** and **Fifth Order Cnoidal**. Information about the types of wave theory is available in Open Channel Wave Boundary Conditions in the Theory Guide.

Wave Height

is the height difference between a wave crest to the neighboring trough.

Since a solitary wave does not have troughs, the wave height is the distance between a wave crest to mean free surface level.

Wave Length

is the wave length of the shallow wave or short gravity wave.

Inlet Offset Distance

is the translational distance from the reference point origin in the reference wave propagation direction. This option is used to generate a wave from a location other than the reference frame origin.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Phase Difference

is the phase difference between one wave and another.

Wave Heading Angle

is the angle between the direction of the wavefront and the reference wave direction, in the plane of the flow surface. In 2D, there are only two possibilities, zero degrees when the wave is in the reference wave direction, and 180 degrees when the wave is in the opposite direction.

Frequency Spectrum Method

specifies the spectrum to use. You can select **Pierson-Moskowitz** (appropriate for fully-developed seas), **Jonswap** (appropriate for fetch-limited seas), or **TMA** (appropriate for fetch-limited, finite-depth seas).

Peak Shape Parameter

controls the shape and amplitude of the frequency peak in the **Jonswap** and **TMA** formulations. This corresponds to γ in Equation 14.101 in the *Fluent Theory Guide*.

Significant Wave Height

is the mean wave height of the largest 1/3 of waves. This corresponds to H_s in Equation 14.100 in the *Fluent Theory Guide*.

Peak Wave Frequency

is the wave frequency corresponding to the highest wave energy. This corresponds to ω_p in Equation 14.100 and Equation 14.101 in the *Fluent Theory Guide*. ω_p can be expressed in terms of the peak wave period, T_p, as $\omega_p = {}^{2\pi}/_{T_p}$.

Minimum/Maximum Wave Frequency

specify the frequency range for the spectrum. Note that the **Peak Wave Frequency** must fall in between **Minimum Wave Frequency** and **Maximum Wave Frequency**.

Number of Frequency Components

specifies the number of components into which the frequency spectrum is divided.

Direction Spreading Method

specifies the method to use for specifying the directional spreading characteristics. You can choose **Unidirectional** (for long-crested waves), **Frequency Independent Cosine Function** (for short-crested waves where the directional component does not depend on frequency), and **Frequency Dependant Hyperbolic Function** (for short-crested waves where the directional component depends on frequency).

Frequency Independent Cosine Exponent

specifies the exponent in the Frequency Independent Cosine Function formulation. This corresponds to s in Equation 14.105 in the *Fluent Theory Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mean Wave Heading Angle

specifies the principal wave heading direction.

Angular Spread

specifies the deviation from the mean wave direction for calculating the angular range.

Number of Angular Components

specifies the number of components into which the angular range is divided.

Potential

displays the boundary conditions for the electric potential field. This tab is available only if you have enabled either the **Electric Potential model** or the **Electrochemical** reaction model in the Species Dialog Box (p. 4877).

Potential Boundary Condition

is a drop-down list of available potential boundary condition types for the potential generated by electron current: **Specified Flux** and **Specified Value**. For the **Specified Flux** boundary condition, you will need to specify **Current Density** at the wall. For the **Specified Value** boundary condition, you will need to specify **Potential** at the wall.

Electrolyte Potential Boundary Condition

is a drop-down list of available boundary condition types for the potential generated by ionic current. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user-defined scalars are specified.

User Scalar n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user-defined scalars are specified.

User Scalar n

specifies the value of the scalar.

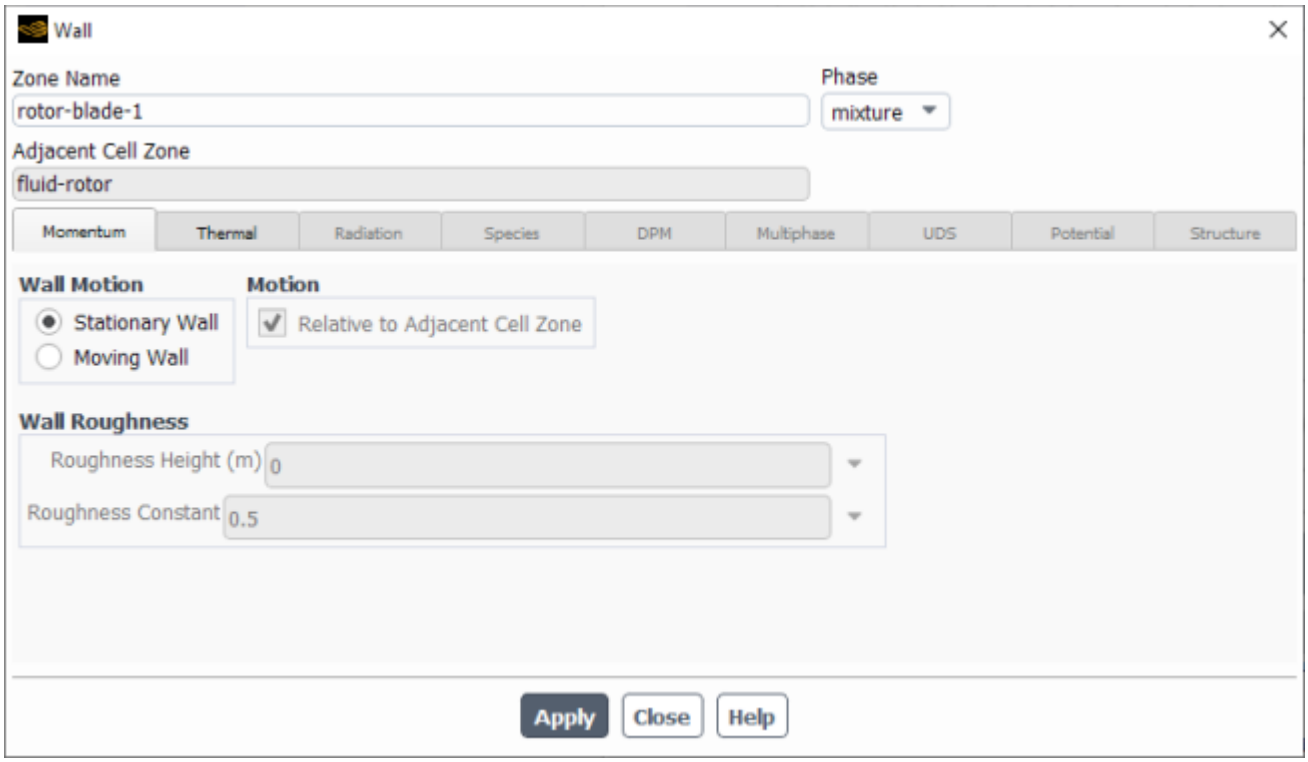
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.7.23. Wall Dialog Box

The **Wall** dialog box sets the boundary conditions for a wall zone. It is opened from the Boundary Conditions Task Page (p. 4937). See Inputs at Wall Boundaries (p. 1436) for details about defining the items below.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Adjacent Cell Zone

shows the name of the cell zone adjacent to the wall. (This is for informational use only; you cannot edit this field.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Momentum

displays the momentum boundary conditions.

Wall Motion

contains options for specifying whether or not the wall is moving.

Stationary Wall

specifies that the wall is not moving relative to the adjacent cell zone.

Moving Wall

enables specification of the tangential wall motion. Tangential wall motion is applicable only to viscous flows. Since the inviscid slip condition decouples the tangential wall velocity from the governing equations, tangential wall motion has no effect on inviscid flow.

Motion

contains inputs related to wall motion. See Velocity Conditions for Moving Walls (p. 1440) for details.

Relative to Adjacent Cell Zone

enables the specification of a wall velocity relative to the velocity of the adjacent cell zone.(If the adjacent cell zone is not moving, this is equivalent to **Absolute**.)

Absolute

enables the specification of an absolute wall velocity,

Translational

enables the specification of a translational wall velocity.

Rotational

enables the specification of a rotational wall velocity.

Components

enables the specification of wall velocity components.

Speed

sets the translational or rotational speed of the wall (depending on whether you selected **Translational** or **Rotational**).

Direction

sets the direction vector of the translational velocity. (This item will appear if you have chosen the **Translational** option.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotation-Axis Origin

sets the coordinates of the origin of the axis of rotation, thereby determining the location of the axis. (This item will appear if you have chosen the **Rotational** option for a non-axisymmetric case.)

Rotation-Axis Direction

sets the direction vector for the axis of rotation. (This item will appear if you have chosen the **Rotational** option for a non-axisymmetric case.)

Velocity Components

sets the **X**, **Y**, and **Z-Velocity** components of the wall motion. (This item will appear if you have chosen the **Components** option.)

Shear Condition

contains options for specifying the shear conditions at the wall.

No Slip

specifies a no-slip condition at the wall. No further inputs are required.

Specified Shear

enables specification of zero or nonzero shear. See Specified Shear (p. 1443) for details. This option is not available for moving walls.

Marangoni Stress

enables the specification of shear stress caused by the variation of surface tension due to temperature. This option is not available for moving walls.

Shear Stress

contains inputs related to wall shear. These items will appear when **Specified Shear** is selected as the **Shear Condition**. See Specified Shear (p. 1443) for details.

X-Component, Y-Component, Z-Component, Swirl Component

specify the x, y, and z or swirl components of shear for a slip wall. **Swirl Component** is available only for axisymmetric swirl cases.

Specularity Coefficient

is used in multiphase granular flow. You can specify the specularity coefficient such that when the value is zero, this condition is equivalent to zero shear at the wall, but when the value is near unity, there is a significant amount of lateral momentum transfer.

Specularity Coefficient

allows you to enter a value between zero and one, which controls the amount of lateral momentum transfer.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Marangoni Stress

contains inputs related to Marangoni stress. This item will appear when **Marangoni Stress** is selected as the **Shear Condition**. See Marangoni Stress (p. 1444) for details.

Surface Tension Gradient

specifies the surface tension gradient with respect to temperature ($d\sigma / dT$ in Equation 7.120 (p. 1444)).

Wall Roughness

contains various models for defining wall roughness size/height in turbulent calculations.

Standard

uses the standard wall roughness methods for most turbulence models. See Wall Roughness Effects in Turbulent Wall-Bounded Flows (p. 1436) for details.

High Roughness (Icing)

contains various models for use only with the Spalart-Allmaras and SST k-ω turbulence models. Specifically applicable to icing simulations, choose from **Specified Roughness**, **NASA Correlation**, **Shin-et-al**, or **ICE3D Roughness File** methods to specify the **Sand-Grain Roughness**. See Wall Roughness Effects in Turbulent Wall-Bounded Flows (p. 1436) for details.

Wall Adhesion

contains inputs related to wall adhesion. This section of the dialog box will appear if you are using the VOF model and have enabled **Wall Adhesion** in the e Multiphase Model Dialog Box (p. 4648) (**Forces** tab).

Contact Angles

specifies the contact angle at the wall for each pair of phases (θ_w in Figure 25.20: Measuring the Contact Angle (p. 2956) in the Theory Guide). See Steps for Setting Boundary Conditions (p. 2953) for details.

Thermal

contains the thermal parameters. This tab is available only when the energy equation is turned on.

Thermal Conditions

contains radio buttons for selecting the thermal boundary condition type. See Thermal Boundary Conditions at Walls (p. 1445) for details about these inputs:

Heat Flux

selects a specified heat flux condition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Temperature

selects a specified wall temperature condition.

Convection

selects a convective heat transfer boundary condition model.

Radiation

selects an external radiation boundary condition.

Mixed

selects a combined convection/external radiation boundary condition.

Coupled

selects a coupled heat transfer condition. It is applicable only to walls that form the interface between two regions (such as the fluid/solid interface for a conjugate heat transfer problem).

via System Coupling

selects a heat transfer condition where a boundary can receive thermal data (either wall temperature, heat flow, or heat transfer coefficient) from the System Coupling service. It is applicable when Ansys Fluent is coupled with another system in Workbench using System Coupling (see Heat Transfer Boundary Conditions Through System Coupling (p. 1453) for details).

via Mapped Interface

specifies that the thermal data is interpolated across a mapped interface. It is available only for the interface wall boundary zones created as part of a mapped interface (see Heat Transfer Boundary Conditions Across a Mapped Interface (p. 1454) for details).

Once a condition type has been selected, the appropriate conditions can be specified.

Heat Flux

sets the wall heat flux to be used for the **Heat Flux** condition. A specification of zero **Heat Flux** is simply the adiabatic condition (no heat transfer). A positive value of heat flux implies that heat enters *into* the domain.

Temperature

sets the wall temperature to be used for the **Temperature** condition.

Heat Transfer Coefficient

sets the convective heat transfer coefficient to be used for the **Convection** condition (h_{eff} in Equation 7.127 (p. 1459)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Free Stream Temperature

sets the reference or free stream temperature to be used for the **Convection** condition (T_{ext} in Equation 7.127 (p. 1459)).

External Emissivity

sets the emissivity of the external wall to be used for the **Radiation** condition (ε_{ext} in Equation 7.128 (p. 1459)).

External Radiation Temperature

sets the temperature of the external radiation source/sink to be used for the **Radiation** condition (T_{∞} in Equation 7.128 (p. 1459)).

Wall Thickness

sets the thickness of a thin wall for the calculation of thermal resistance. (See Thin-Wall Thermal Resistance Parameters (p. 1448) for details.)

Heat Generation Rate

sets the rate of heat generation in a wall without shell conduction.

Contact Resistance

sets the contact resistance (R_c in Equation 16.23 in the Theory Guide) at the wall. See Modeling Solidification and Melting (p. 3211) for details. This item appears only when the solidification/melting model is used.

Material Name

sets the material type for a thin wall. The conductivity of the material is used for the calculation of thin-wall thermal resistance. (See Thin-Wall Thermal Resistance Parameters (p. 1448) for details.) **Material** is used only when **Wall Thickness** is nonzero. Materials are defined with the Materials Task Page (p. 4831).

Shell Conduction

enables shell conduction for the wall. See Shell Conduction (p. 1452) for details.

Edit...

is only available when **Shell Conduction** is enabled, and opens the Conduction Layers Dialog Box (p. 5354) in order to allow you to define the shell conduction settings for the wall.

Radiation

displays the boundary conditions for the S2S model, the DO model, the MC model, and the non-gray P-1 model at the wall. This tab is only available if you are using the surface to surface model, the discrete ordinates model, the Monte Carlo model, or the non-gray P-1 model. See Forming Surface Clusters (p. 2165), Wall Boundary Conditions for the DO Model (p. 2184), and Wall Boundary Conditions for the DTRM, P-1, S2S, and Rosseland Models (p. 2184) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

BC Type

contains a drop-down list of available radiation boundary condition types. The available options are **opaque** and **semi-transparent**. This item will appear only if you are using the discrete ordinates or Monte Carlo model.

Boundary Source

enables the wall to be a radiation source. This is only available for external semi-transparent walls with the MC or DO models and for internal or external opaque walls with the MC model.

Polar Distribution Function

enables a polar (rotationally symmetric about a given direction) boundary source which can be used if the irradiation intensity varies with direction such as in the case of LED light sources. The polar distribution function is defined by an **Expression** or by a table of data pairs consisting of an **Angle** and it's corresponding **Relative Intensity**. You have the option to read and write the polar data in the form of `.csv` files or plotting the data in the graphics window. Only available with the MC model.

Reference Direction

Specify the (X,Y,Z) vector that defines the center of the polar distribution function. Only available with the MC model.

Internal Emissivity

sets the internal emissivity of the wall. This item will appear only if you are using the P-1, DO, MC, DTRM, or S2S models for radiation heat transfer.

Diffuse Fraction

specifies the fraction of the irradiation that is to be treated as diffuse. By default, the **Diffuse Fraction** is set to 1, indicating that all of the irradiation is diffuse. If the non-gray DO or MC model is being used, the **Diffuse Fraction** can be specified for each band. This item will appear only if you are using the Monte Carlo or discrete ordinates model.

Beam Width

specifies the beam width for an external semi-transparent wall in terms of the **Theta** and **Phi** extents. This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Beam Direction

specifies the beam direction as an **X,Y,Z** vector. You can specify the **Beam Direction** as a constant, a profile, or a user-defined function. This item will appear only if you are using the Monte Carlo model or the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Direct Irradiation

specifies the value of the irradiation flux. If the non-gray DO or MC models are being used, a constant **Direct Irradiation** can be specified for each band.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This item will appear only if you are using the MC model or the **semi-transparent BC Type** with the DO model.

Apply Direct Irradiation Parallel to the Beam

By default, **Apply Direct Irradiation Parallel to the Beam** is selected, which means Fluent assumes that the value you specify for **Direct Irradiation** is the irradiation flux parallel to the **Beam Direction**. When deselected, Ansys Fluent assumes that the value you specify for **Direct Irradiation** is the irradiation flux normal to the boundary.

Apply Irradiation About the Reference Direction

By default, **Apply Irradiation About the Reference Direction** is selected, which means Fluent assumes that the value you specify for **Direct Irradiation** is the irradiation flux parallel to the **Reference Direction**. When deselected, Ansys Fluent assumes that the value you specify for **Direct Irradiation** is the irradiation flux normal to the boundary. See Figure 5.12: DO Irradiation on External Semi-Transparent Wall in Semi-Transparent Exterior Walls in the Theory Guide for details.

Diffuse Irradiation

specifies the value of the irradiation flux. If the non-gray DO or MC model is being used, a constant **Diffuse Irradiation** can be specified for each band.

This item will appear only if you are using the DO or MC radiation model and you have selected **semi-transparent** as the **BC Type**.

Solar Boundary Conditions

contains the settings for solar ray tracing. This group box is available only if you select **Solar Ray Tracing** from the **Model** list in the **Solar Load** group box of the **Radiation Model** dialog box. For semitransparent coupled walls, the solar ray tracing settings are defined on the original wall and not on the shadow wall. See Solar Ray Tracing (p. 2225) for details.

Participates in Solar Ray Tracing

specifies whether or not the wall participates in solar ray tracing.

Absorptivity

contains the settings that define the absorptivity of wall.

Direct Visible

specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

Direct IR

specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Diffuse Hemispherical

specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar radiation to account for the absorption of the wall. This setting is only available for semi-transparent walls.

Transmissivity

contains the settings that define the transmissivity of wall. This group box is only available when **semi-transparent** is selected for **BC Type**.

Direct Visible

specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the wall. The value should be defined for normal incident rays. This setting is only available for semi-transparent walls.

Direct IR

specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the wall. The value should be defined for normal incident rays. This setting is only available for semi-transparent walls.

Diffuse Hemispherical

specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar irradiation to account for the transmissivity of the wall. This setting is only available for semi-transparent walls.

S2S Parameters

contains the settings for the S2S radiation model. This group box is available only if you select the **Surface to Surface** radiation model. See Forming Surface Clusters (p. 2165) for details.

Faces Per Surface Cluster

sets the number of faces per surface cluster (FPSC) for the wall, and thus controls the number of radiating surfaces and (if you select **Cluster to Cluster** for **Basis** in the **View Factors and Clustering** dialog box) view factor surfaces.

Critical Zone

specifies that the wall is a critical zone. When this option is enabled, the value entered for **Faces Per Surface Cluster** will not be altered when you use **Automatic** clustering in the **View Factors and Clustering** dialog box, and impacts the calculations and actions performed by the buttons in the **Maximum Distance from Critical Zone** group box of the **Participating Boundary Zones** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Participates in View Factor Calculation

specifies whether or not the wall participates in the view factor calculation as part of the S2S radiation model. This option is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters. This tab is available only if you have enabled the **Species Transport** model in the Species Model Dialog Box (p. 4716).

Reaction

activates reactions at the wall. This item will appear only if you have enabled the **Wall Surface** reactions in the Species Model Dialog Box (p. 4716).

When this option is enabled, you can specify the following settings:

Reaction Mechanisms

allows you to specify a defined group, or mechanism, of available reactions. This item will appear only if the **Reaction** option is enabled. See Defining Zone-Based Reaction Mechanisms (p. 2385) for details about defining reaction mechanisms.

Surface Area Washcoat Factor

allows you to specify a factor, which multiplies the wall area to account for the increased surface area of washcoats. See Species Boundary Conditions for Walls (p. 1455) for details.

Initial Deposition Thickness

is the thickness of the solid species deposition on the wall at the start of the simulation. This item is available is available for transient simulation only and is used only for postprocessing of the **Wall Deposition Thickness** field variable.

Solid Species Density

is the density of the solid species deposited on the wall. This item is available is available for transient simulation only and is used only for postprocessing of the **Wall Deposition Thickness** field variable.

Species Boundary Condition

contains options for the specification of species boundary conditions. You can choose from the following conditions:

- **Specified Mass Flux** (default): Indicates that the species mass flux will be specified.
- **Specified Mass Fraction**: Indicates that the species mass fraction will be specified.

See Species Boundary Conditions for Walls (p. 1455) for details. This item is available only if the **Reaction** option is disabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Species Mass Fraction / Mass Flux

contains inputs for the species mass fractions and mass fluxes (depending on the specification method selected for each species). This item is available only if the **Reaction** option is disabled.

DPM

contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase Model Boundary Conditions

contains inputs for setting the fate of particle trajectories at the wall. These options will appear when one or more injections have been defined. See Setting Boundary Conditions for the Discrete Phase (p. 2776) for details.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficients of restitution (see Particle Reflection at Wall in the *Fluent Theory Guide*). When at least one injection accounts for the rough wall model (the **Rough Wall Model** option is selected under the **Physical Models** tab in the **Set Injections Properties** dialog box), you can specify the **DPM Wall Roughness Parameters** (**Ra**, **Rq**, and **RSm** in Equation 12.201 in the *Fluent Theory Guide*). (See Rough Wall Model (p. 2765)).

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See Figure 23.40: "Trap" Boundary Condition for the Discrete Phase (p. 2780).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See Figure 23.41: "Escape" Boundary Condition for the Discrete Phase (p. 2780).

reinject

reintroduces the particle into the domain when it reaches a certain domain boundary (for example, outlet). This item appears when one or more injections have been defined and **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box. See The **reinject** Boundary Condition (p. 2781) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 12.6: "Wall Jet" Boundary Condition for the Discrete Phase in the Theory Guide.

wall-film

allows you to select the following options:

- **Particle-Wall Heat Exchange** (Particle-Wall Impingement Heat Transfer (p. 2783))
- **Film Condensation** (Film Condensation Model (p. 2803))
- **Gas-Side Boundary Layer Model** (default) (Gas-Side Boundary Layer Model (p. 2806))
- **Particle Stripping** (Setting the Lagrangian Wall Film Model (p. 2799))
- **Initialize Wall Film** (Patching the Wall Film (p. 2806))

and specify model parameters in the following group boxes:

- **Impingement/Splashing Parameters** (Setting the Lagrangian Wall Film Model (p. 2799))
- **Separation Model Parameters** (Setting the Lagrangian Wall Film Model (p. 2799))
- **Erosion Models** (Setting Particle Erosion and Accretion Parameters (p. 2784))

Selecting **wall-film** automatically enables the **Consider Children in the Same Tracking Step** option in the **Discrete Phase Model** dialog box (**Physical Models** tab).

See Setting the Lagrangian Wall Film Model (p. 2799) for details about the wall-film models and their parameters.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Discrete Phase Reflection Coefficients

determine the behavior of reflecting particles. This item appears when **reflect** is chosen as the **Discrete Phase BC Type**. See Discrete Phase Boundary Condition Types (p. 2777) for details on setting the following items.

Normal

sets the type of function for the normal coefficient of restitution. This function can be **constant**, **piecewise-linear**, **piecewise-polynomial**, or **polynomial**.

Tangent

sets the type of function for the tangential coefficient of restitution. This function can be **constant**, **piecewise-linear**, **piecewise-polynomial**, or **polynomial**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DEM Collision Partner

contains a list of names to designate the collision partner.

Erosion Model

contains a list of erosion models. See Setting Particle Erosion and Accretion Parameters (p. 2784) for details about these items.

Generic Model

enables erosion rates to be computed using the generic erosion model. (See Accretion in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the **Generic Erosion Model Parameters** dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784).

Finnie

enables erosion rates to be computed using the Finnie formulation. (See Accretion in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the **Finnie Model Parameters** dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784).

McLaury

enables erosion rates to be computed using the McLaury formulation. (See McLaury Erosion Model in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the **McLaury Model Parameters** dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784).

Oka

enables erosion rates to be computed using the Oka formulation. (See Oka Erosion Model in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the **Oka Model Parameters** dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784).

DNV

enables erosion rates to be computed using the DNV formulation. (See DNV Erosion Model in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the **DNV Model Parameters** dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784).

Sheer Stress

enables erosion rates to be computed using the sheer stress model. (See Abrasive Erosion Caused by Solid Particles in the *Fluent Theory Guide* for background information about this model.) When this model is enabled, you must specify the erosion parameters in the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sheer Stress Model Parameters dialog box (opened by clicking the corresponding **Edit...** button) as described in Setting Particle Erosion and Accretion Parameters (p. 2784). This model is available only for multiphase flow with a dispersed secondary granular phase.

Granular Phase Shielding

includes the shielding effect in other erosion models that are currently enabled. The granular phase shielding is always considered in the sheer stress erosion model. (See Wall Shielding Effect in Dense Flow Regimes in the *Fluent Theory Guide* for background information about this model.) This option is available only when **Shear Stress Model Parameters** is selected.

Friction Coefficient

specifies μ in Equation 12.194 and Equation 12.199 in the *Fluent Theory Guide* as a **constant** or a **piecewise-linear**, **piecewise-polynomial**, or **polynomial** function of relative velocity. This item appears only when **Enable Rotation** is selected under the **Physical Model** tab of the Set Injection Properties Dialog Box (p. 5550).

UDS

displays the boundary conditions for user-defined scalars (UDSs) at the wall. This tab is available only if you have specified a nonzero number of user-defined scalars in the User-Defined Scalars Dialog Box (p. 5596).

User Defined Scalar Boundary Condition

contains options for the specification of UDS boundary conditions. See the separate Fluent Customization Manual for details.

Specified Flux

indicates that the flux of the UDS at the wall will be specified.

Specified Value

indicates that the value for the UDS at the wall will be specified.

User Defined Scalar Boundary Value

contains inputs for the value of the flux of the UDS, or the value of the UDS itself, depending on your selection for that UDS under **User Defined Scalar Boundary Condition**.

Wall Film

displays the boundary conditions for liquid films at the wall. This tab is available only if you have enabled the Eulerian Wall Film model in the Models Task Page (p. 4644).

Eulerian Film Wall

allows you to define a film wall condition for any wall. See Modeling Eulerian Wall Films (p. 3231) for details. Once this option is enabled, you can set the following:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Film Condition Type

allows you to select the desired condition type.

Boundary Condition

allows you to specify settings for boundary **Film Conditions**:

Film Mass Flux

The film mass source in terms of mass flux per unit area (kg/m^2–s).

X-Momentum Flux, Y-Momentum Flux, and Z-Momentum Flux

The film momentum source in terms of momentum flux per unit area (N/m^2).

Incoming Film Temperature

The film temperature (K).

Film Passive Scalar Flux

The film passive scalar source in terms of mass flux per unit area (kg/m^2–s).

Initial Condition

allows you to specify settings for initial **Film Conditions**:

Film Height

The film height at the wall boundary.

X-Velocity, Y-Velocity, and Z-Velocity

The film velocity components at the wall boundary.

Film Temperature

The film temperature (K).

Film Passive Scalar

The film passive scalar at the wall boundary (dimensionless).

Relative Film Momentum Flux

(moving reference frames or moving walls only) enables specification of the film momentum flux relative to the wall on which liquid film is defined (**Boundary Condition** type only). This option is only available when **Moving Wall** is selected in the **Wall** dialog box and/or **Frame Motion** is selected in the **Fluid** dialog box.

Relative Initial Film Velocity

(moving reference frames or moving walls only) enables specification of the initial velocity relative to the wall on which liquid film is defined (**Initial Condition** type only). This option

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

is only available when **Moving Wall** is selected in the **Wall** dialog box and/or **Frame Motion** is selected in the **Fluid** dialog box.

User Source Terms

enables you to specify the additional source terms to the film continuity (**Mass Flux**), momentum (**X-Momentum Flux**, **Y-Momentum Flux**, and **Z-Momentum Flux**), energy (**Heat Flux**), and passive scalar equations (**Scalar Flux**). This option is only available with initial conditions.

Flow Momentum Coupling

When this option is selected, the liquid film and the gas flow will share the same velocity at the interface of the liquid-gas interface using a two-way coupling. When this option is not selected, the coupling between the liquid film and the gas flow is only one-way, namely, while the gas flow impacts the film flow, the film flow does not impact the bulk of the gas flow.

Film Phase Change

enables the phase change for the selected wall. This option is available only when **Phase Change** is selected in the **Model Options and Setup** tab of the Eulerian Wall Film Dialog Box (p. 4818). Once enabled, you can select **Phase Change Model** and specify its parameters (in the **Phase Change Parameters** group box).

The following models are available:

- **diffusion-balance**: You can specify **Condensation Constant** and **Vaporization Constant**.
- **wall-boundary-layer**: No user input is required.
- **user-defined**: You can specify **Condensation Rate** and **Vaporization Rate** as constants, parameters, or profile user-defined functions (UDFs). Note that condensation and vaporization rates must be specified as positive values in kg/s. For more information on profile UDFs, the separate Fluent Customization Manual.

For more information on the phase change models see Coupling of Wall Film with Mixture Species Transport in the *Fluent Theory Guide*.

Film Contact Angle

enables the Partial Wetting model. This option is available only with initial condition when **Surface Tension** is selected in the **Model Options and Setup** tab of the Eulerian Wall Film Dialog Box (p. 4818). Once this option is enabled, you can specify the **Contact Angle Parameters**.

The following parameters are available:

- **Contact Angle**: Corresponds to θ_m described in Partial Wetting Effect in the *Fluent Theory Guide*. The input range for this parameter is 0 to 180 degrees.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Relative Standard Deviation**: Corresponds to α described in Partial Wetting Effect in the *Fluent Theory Guide*. The input for the **Relative Standard Deviation** should be in the range of 0 to 50%.
- **Contact Angle Force Beta**: Corresponds to β in Equation 18.29 in the *Fluent Theory Guide*. The input range for this parameter is 0 to 10.

For more information on modeling film partial wetting effect see Partial Wetting Effect in the *Fluent Theory Guide*.

Impingement Parameters

contains parameters related to particle-wall impingement

Impingement Model

is a drop-down list that contains available impingement models.

The list of models includes:

- **stanton-rutland** (default): consists of four impingement regimes: stick, rebound, spread and splash, which are based on the impact energy and wall temperature. See The Stanton-Rutland Model in the *Fluent Theory Guide* for details.
- **kuhnke**: consists of four impingement regimes: stick, rebound, spread and splash (thermal breakup). See The Kuhnke Model in the *Fluent Theory Guide* for details.

DPM Wall Splash

allows you to enable the wall splashing for the selected wall and specify the **Number of Splashed Particles**. The minimum value is 3. This option is available when **Particle Splashing** is enabled in the **Eulerian Wall Film** dialog box.

Kuhnke Model Parameters

(available when the **kuhnke** model is selected from the **Impingement Model** drop-down list)

Wall Roughness Length

enables you to specify wall roughness values used by the Kuhnke model.

The following options are available:

- **Ra**: the wall mean roughness that is used to compute K_{cold} in Equation 12.249 in the *Fluent Theory Guide*
- **Rz**: the average surface roughness that is used to compute splashed particle reflection angle distribution Equation 12.261 in the *Fluent Theory Guide*.

Critical Temperature Factor

is the dimensionless variable that is used to determine the impingement regime transition temperature in Equation 12.239 in the *Fluent Theory Guide*.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Potential

displays the boundary conditions for the electric potential field at the wall. This tab is available only if you have enabled either the **Electric Potential model** under the **Model** tree branch or the **Electrochemical** Reaction model in the Species Dialog Box (p. 4877).

Electrochemical Reaction

enables electrochemical reactions at the wall. This option is available only if **Electrochemical** reactions are enabled in the **Species Model** dialog box.

When this option is enabled, the following controls are available:

Faradaic Heat

(if enabled) includes heat from the electrochemical reaction in the energy equation. This option is available only if **Electrochemical** reactions are enabled in the **Species Model** dialog box.

Reaction Mechanism

contains a drop-down list of all available electrochemical reaction mechanisms. This option is available only if **Electrochemical** reactions are enabled in the **Species Model** dialog box.

Potential Boundary Condition

contains a drop-down list of available boundary condition types for the potential generated by electron current on walls. You can define the following potential boundary conditions for the :

- For **Specified Flux**, you must specify **Current Density**
- For **Specified Value**, you must specify **Potential** at the wall
- (two-sided internal walls only) For **Coupled**, the boundary condition you specify on a coupled wall will be automatically applied to both walls in the wall / wall-shadow pair.

  If you are using the potential solver alone, you can also use decoupled potential boundary conditions (**Specified Flux** or **Specified Value**) for the wall/wall-shadow pair, that is, you can define different boundary condition for them independently. However, this option is not available for **Lithium-ion Battery Model**, **Electrolysis and H2 Pump Model**, or **Electrochemical** reactions.

- **Contact Resistance**: is the contact resistance at the wall, R in Equation 19.3 in the *Fluent Theory Guide*.

For details about these items, see the following sections:

- Setting Up the Electric Potential Model (p. 3258)
- Setting Up the Lithium-ion Battery Model (p. 3260)
- Setting the Electrolysis and H2 Pump Model (p. 3267)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Electrolyte Potential Boundary Condition

contains a drop-down list of available boundary condition types for the potential generated by ionic current on walls. This item is similar to the **Potential Boundary Condition** drop-down list described above and is available only for the Electrolysis and H2 Pump model.

Ablation

contains the ablation model parameters.

Ablation Model

is a drop-down list that contains available ablation models. This tab is available only when **Ablation Dynamic Mesh Coupling** is enabled in the **Ablation Dynamic Mesh Coupling Model** dialog box. See The Ablation Condition at Wall Boundaries (p. 2321) for details.

The available ablation models are:

- **none** (default): Signifies that this wall boundary is not an ablative surface.
- **Vielle's model**: Calculates the ablative surface recessing rate r using Equation 16.11 (p. 2322). You need to specify the following Vielle's model parameters:
  - **Parameter A**: is A in Equation 16.11 (p. 2322).
  - **Model Parameter n**: is n in Equation 16.11 (p. 2322).
  - (optional) **Species Flux**: when enabled, mass and heat transfer of the ablative process are considered using Equation 16.12 (p. 2322). For this option, you need to specify:
    - → **Ablative Material Density**: ρ_a in Equation 16.12 (p. 2322)
    - → **Species Mass Fraction**: y_i in Equation 16.12 (p. 2322)
- **Surface Reaction**: Calculates the ablative surface recessing rate r using Equation 16.13 (p. 2322). You need to specify the following parameter:
  - **Ablative Material Density**: is ρ_a in Equation 16.13 (p. 2322).

  The **Surface Reaction** model is available only when **Wall Surface** is enabled in the **Species Model** dialog box and **Reaction** is enabled in the **Wall** dialog box (**Species** tab).

Structure

contains the displacement boundary condition settings for walls that are adjacent to solid cell zones. This tab is only available when a model is selected in the Structural Model Dialog Box (p. 4817).

X-Displacement Boundary Condition, Y-Displacement Boundary Condition, Z-Displacement Boundary Condition

contains a drop-down list of methods for calculating the displacement of the nodes in that particular direction:

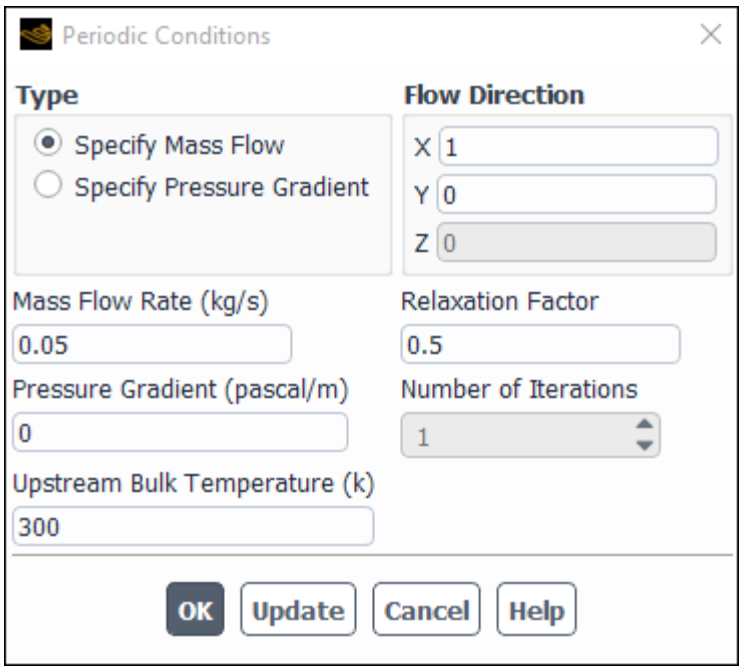
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Stress Free** specifies that the displacement is not affected by stress loads from the fluid flow.
- **Node X-**, **Node Y-**, and (for 3D cases) **Node Z-Force** specifies that the displacement results from a specified force applied on the nodes, which is defined using the **Node X-**, **Node Y-**, and (for 3D cases) **Node Z-Force** field.
- **Node X-**, **Node Y-**, and (for 3D cases) **Node Z-Displacement** applies a specified displacement on the nodes, which is defined using the **X-**, **Y-**, and (for 3D cases) **Z-Displacement** field.
- **Face Pressure** specifies that the displacement results from a specified pressure load on the faces, which is defined using the **Face Pressure** field.
- **Intrinsic FSI** specifies that the displacement results from pressure loads exerted by the fluid flow on the faces. Note that this selection is only available for a zone that is part of a wall / wall-shadow pair.

50.7.24. Periodic Conditions Dialog Box

The **Periodic Conditions** dialog box allows you to set parameters that define fully-developed periodic flow and heat transfer. See User Inputs for the Pressure-Based Solver (p. 1721) and Using Periodic Heat Transfer (p. 2240) for details.

(This dialog box is available only when the pressure-based solver is used; it is not available for the density-based coupled solvers.)



Controls

Specify Mass Flow

enables the specification of the mass flow rate.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specify Pressure Gradient

enables the specification of the pressure gradient.

Mass Flow Rate

specifies the mass flow rate. This item will not be available if you selected the **Specify Pressure Gradient** option.

Important:

For axisymmetric problems, the mass flow rate is per 2π radians.

Pressure Gradient

specifies the pressure gradient (β in Equation 1.22 in the Theory Guide).

Upstream Bulk Temperature

sets the inlet bulk temperature for periodic heat transfer calculations.

Flow Direction

sets the direction of the periodic flow. The direction vector must be parallel to the periodic translation direction or its opposite.

Relaxation Factor

sets the under-relaxation factor that controls convergence of the iteration process described in Setting Parameters for the Calculation of β (p. 1723) for specified mass flow.

Number of Iterations

sets the number of subiterations done on the correction of β in the pressure correction equation for specified mass flow. See Setting Parameters for the Calculation of β (p. 1723) for details.

Update

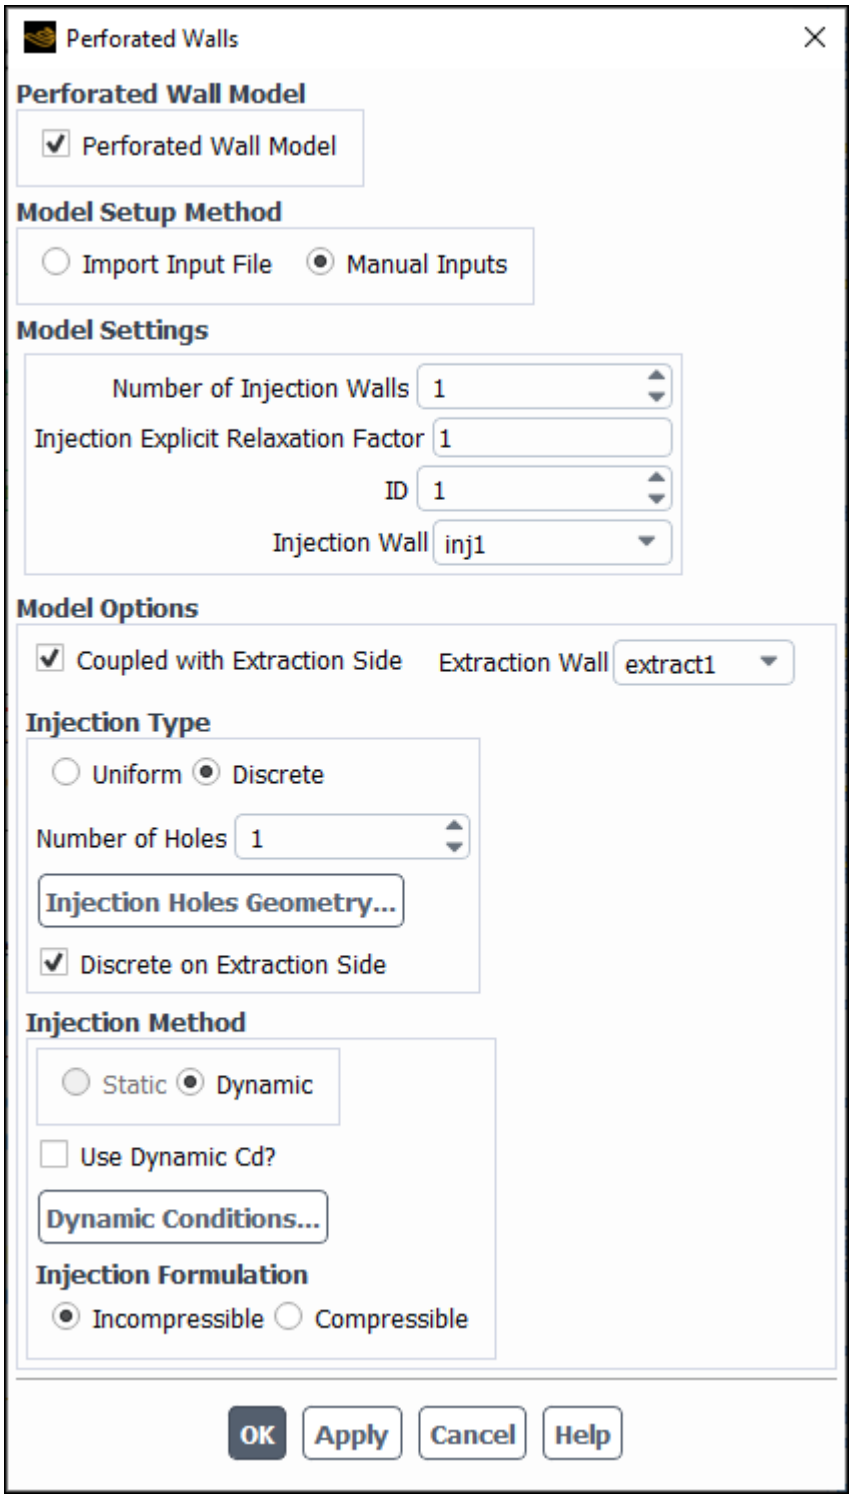
updates the **Pressure Gradient** field with the current value.

50.7.25. Perforated Walls Dialog Box

The **Perforated Walls** dialog box opens when you click the **Perforated Walls...** in the **Boundary Conditions** task page. It allows you to set parameters that define perforated walls boundary conditions. See Perforated Wall Boundary Conditions (p. 1460) for details.

(This dialog box is available only when the pressure-based solver is used; it is not available for the density-based solvers.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Perforated Wall Model

enables the perforated wall model described in Perforated Wall Boundary Conditions (p. 1460).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Model Setup Method

is where you can select an appropriate method for setting up the perforated wall model. The following parameters and options are available:

Import Input Files

allows you to read an input file that contains the selections of model options and values of the model parameters. This option is useful for cases where hundreds or even thousands of perforated holes need to be defined.

Manual Inputs

allows you to manually specify options and parameters for the perforated wall model. When this option is selected, the **Perforated Walls** dialog box expands to reveal relevant model inputs.

Model Settings

is where you can specify:

Number of Injection Walls

specifies the total number of injection walls. You will need to define boundary conditions for each wall separately.

Injection Explicit Relaxation Factor

controls the update of the injection mass flow rate at each iteration. It is used to blend the injection mass flow rates calculated by Equation 7.131 (p. 1462) (for incompressible flow) or Equation 7.132 (p. 1462) (for compressible flow) at the current and previous iterations.

ID

sets the ID number of the injection wall. This number must be between 1 and the value specified in **Number of Injection Walls**.

Injection Wall

allows you to select the name of the injection wall.

Model Options

is a group box that contains the following settings:

Extraction Wall

allows you to select the extraction wall you want to couple with the injection wall.

Injection Type

is where you can select **Uniform** or **Discrete** modeling approach. See Modeling Concept (p. 1461) for more information about these two approaches.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For the **Discrete** injection type, you also need to specify the following:

Number of Holes

sets the total number of perforated holes in the injection wall.

Injection Holes Geometry...

opens the **Injection Holes** dialog box. See Setting Perforated Walls (p. 1463) for detailed information about this dialog box.

Discrete on Extraction Side

disabling this option allows you to model the uniform condition on the extraction side. This option is enabled by default.

Injection Method

is where you can set the following:

Dynamic Conditions...

opens the **Dynamic Setup** dialog box. See Setting Perforated Walls (p. 1463) for detailed information about this dialog box.

Injection Formulation

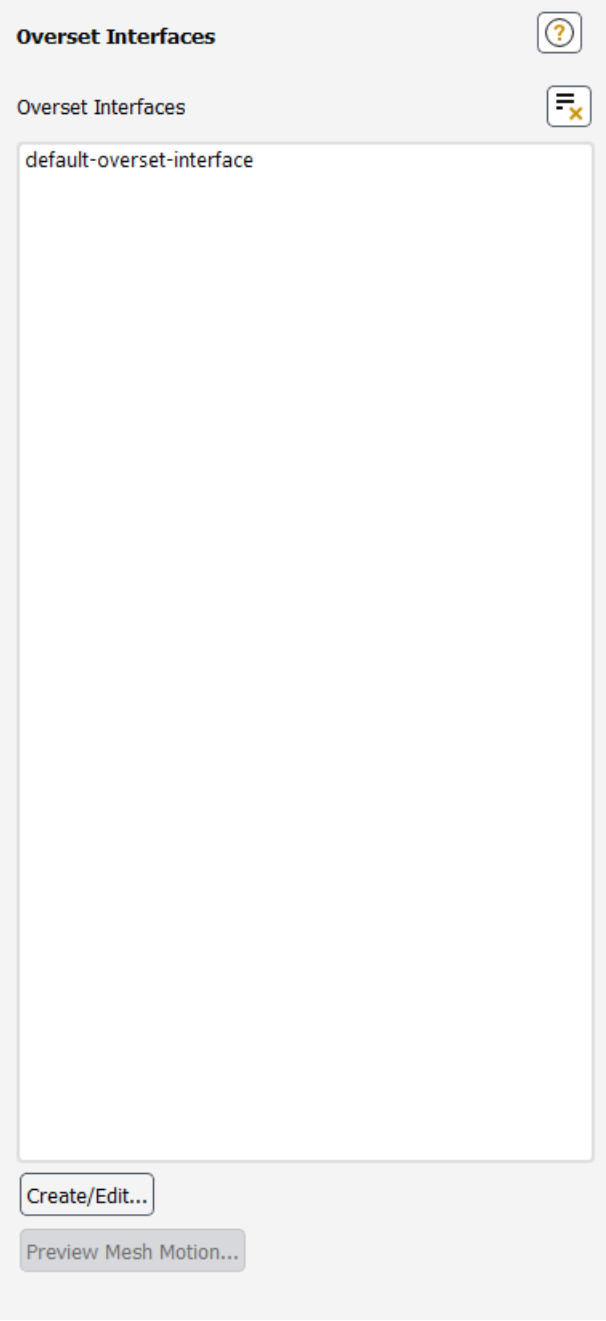
allows you to choose the injection formulation from the following options:

- **Incompressible**: Uses Equation 7.131 (p. 1462) to calculate the injection mass flow rate at the hole exit.
- **Compressible**: Uses Equation 7.132 (p. 1462) to calculate the injection mass flow rate at the hole exit.

50.8. Overset Interfaces Task Page

The **Overset Interfaces** task page allows you to create overset interfaces. For additional information about overset interfaces, see Overset Meshes (p. 1183).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Create/Edit...

displays the Create/Edit Overset Interfaces Dialog Box (p. 5056).

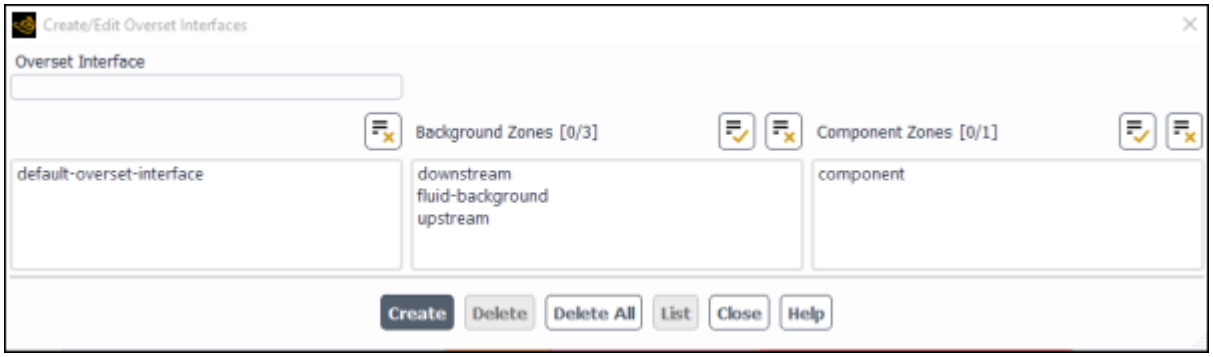
Preview Mesh Motion...

displays the Mesh Motion Dialog Box (p. 5097).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.8.1. Create/Edit Overset Interfaces Dialog Box

The **Create/Edit Overset Interfaces** dialog box allows you to create and delete overset interfaces. For additional information, see Overset Meshes (p. 1183).



Overset Interface

contains a text entry box where you must specify the name of the overset interface. Below is a list of all existing overset interfaces.

Background Zones

lists all of the background zones available for selection when creating an overset interface. Multiple background zones can be part of an overset interface; however, a background zone cannot be part of multiple overset interfaces. It is acceptable to have an interface with only component zones and no background zones.

Component Zones

lists all of the component zones available for selection when creating of an overset interface. Multiple components can be part of an overset interface; however, a component zone cannot be part of multiple overset interfaces.

Create

creates an overset interface using the name in the **Overset Interface** text box and the zones selected under **Background Zones** and **Component Zones**. Note that grid priorities, if required, are added to the interface after it is created, using the text command `define/overset-interfaces/grid-priorities`.

Delete

deletes the selected **Overset Interface**.

Delete All

deletes all overset interfaces in the domain.

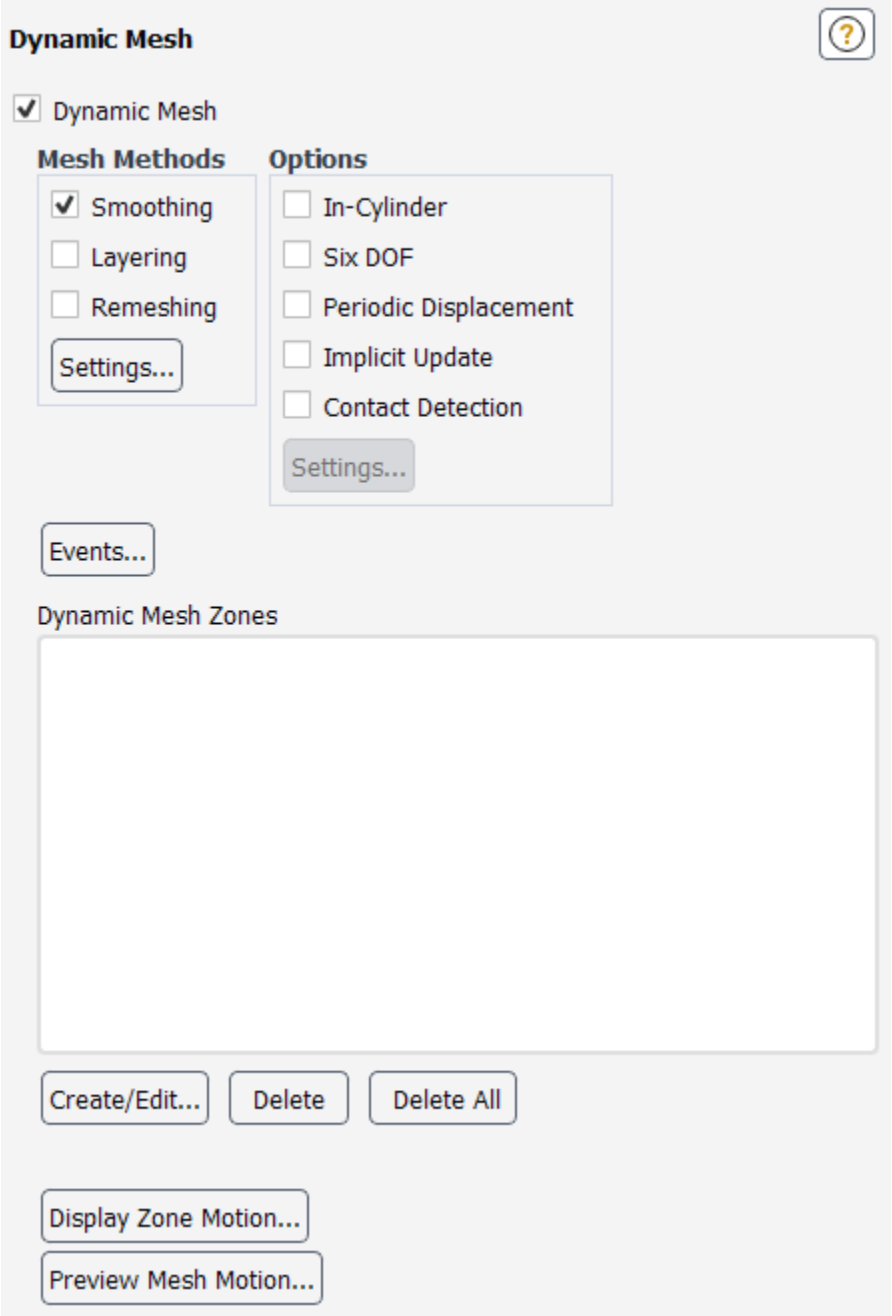
List

prints zonal information and grid priorities for the selected **Overset Interface**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.9. Dynamic Mesh Task Page

The **Dynamic Mesh** task page allows you to define the all the parameters for modeling a dynamic mesh model. See Setting Dynamic Mesh Modeling Parameters (p. 1782) for details about using the items below.



Controls

Dynamic Mesh

enables the dynamic mesh model and activates the controls in the task page.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mesh Methods

contains options to specify the mesh update method(s).

Smoothing

enables mesh smoothing. See Smoothing Methods (p. 1784) for details about the smoothing methods available.

Layering

enables the dynamic layering method that can be used to add or remove layers of cells adjacent to a moving boundary based on the height of the layer adjacent to the moving surface in prismatic mesh zones. See Dynamic Layering (p. 1805) for details.

Remeshing

enables remeshing methods. For details, see Remeshing (p. 1809).

Settings...

displays the Mesh Method Settings Dialog Box (p. 5060) in which you can specify settings for the Smoothing, Layering, and Remeshing methods.

Options

contains options to specify specialized dynamic mesh models.

In-Cylinder

enables the in-cylinder model. See In-Cylinder Settings (p. 1836) for more information.

Six DOF

enables the six degrees of freedom (DOF) solver. See Six DOF Solver Settings (p. 1851) for more information.

Periodic Displacement

enables periodic displacement for blade flutter analysis. See Using Dynamic Mesh Zones in a Blade Flutter Simulation (p. 1945) for more information.

Implicit Update

specifies that the mesh is updated during a time step (as opposed to just at the beginning of a time step). See Implicit Update Settings (p. 1856) for more information.

Contact Detection

enables contact detection. See Contact Detection Settings (p. 1858) for more information.

Settings...

opens the Options Dialog Box (p. 5067), where you can set the parameters for the options that are enabled in the **Options** group box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Events...

displays the Dynamic Mesh Events Dialog Box (p. 5081).

Dynamic Mesh Zones

displays a list of dynamic mesh zones.

Create/Edit...

displays the Dynamic Mesh Zones Dialog Box (p. 5086).

Delete

removes the selected dynamic zone(s) from the **Dynamic Mesh Zones** list.

Delete All

removes all dynamic zones from the **Dynamic Mesh Zones** list.

Display Zone Motion...

displays the Zone Motion Dialog Box (p. 5096).

Preview Mesh Motion...

displays the Mesh Motion Dialog Box (p. 5097).

For additional information, see the following sections:

50.9.1. Mesh Method Settings Dialog Box
50.9.2. Mesh Smoothing Parameters Dialog Box
50.9.3. Advanced Remeshing Settings Dialog Box

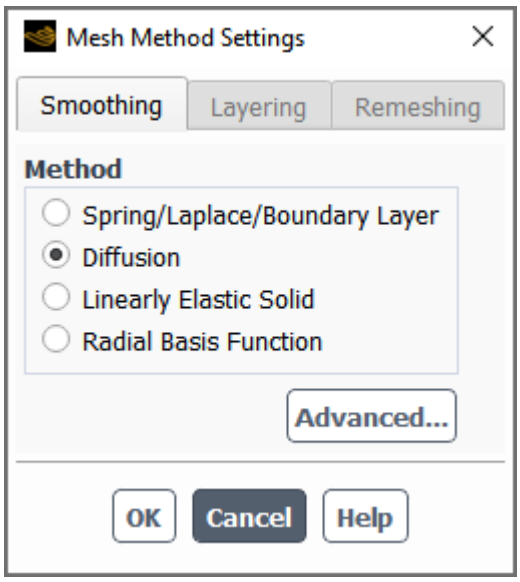
50.9.19. Autosave Case During Mesh Motion Preview Dialog Box

50.9.1. Mesh Method Settings Dialog Box

The **Mesh Method Settings** dialog box allows you to apply settings for the smoothing, layering, or remeshing methods.



Controls

Smoothing

contains parameters to be specified for the smoothing mesh update method.

Method

allows you to specify the smoothing method.

Spring/Laplace/Boundary Layer

specifies that the smoothing method is spring based, or appropriate for the Laplacian smoothing method (for 2.5D remeshing) or the boundary layer smoothing method.

Diffusion

selects the diffusion-based smoothing method.

Linearly Elastic Solid

selects smoothing based on the equations for a linearly elastic solid.

Radial Basis Function

selects smoothing that is based on a radial basis function interpolation, so that Fluent solves for a displacement field that satisfies the displacements at boundaries with prescribed motion and then interpolates the displacements onto all other nodes in the interior and at the deforming boundaries.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Advanced...

opens the Mesh Smoothing Parameters Dialog Box (p. 5064), in which you can define the settings for the selected smoothing **Method**.

Layering

contains parameters to be specified for the layering mesh update method.

Options

specifies the criteria for splitting or collapsing cell layers.

Height Based

specifies that the cell layers are split or merged based on height.

Ratio Based

specifies that the cell layers are split or merged based on ratios.

Split Factor

specifies the value of α_s in Equation 12.15 (p. 1806). It controls the height or ratio at which the cells are split.

Collapse Factor

specifies the value of α_c in Equation 12.16 (p. 1807). It controls the height or ratio at which the cells are collapsed and merged into the next layer.

Remeshing

contains parameters to be specified for the remeshing mesh update method. For details about using the controls that follow, see Remeshing (p. 1809).

Methods-Based Remeshing

allows you to selectively enable a variety of remeshing options, each of which is suitable for particular kinds of cell types.

Unified Remeshing

specifies that an algorithm is applied that combines aspects of a variety of remeshing methods and by default attempts to maintain the initial mesh size distribution even as the mesh moves. It is applied to triangular or tetrahedral cells and can produce wedge cells in 3D boundary layer meshes. It simplifies the setup and can provide increased robustness, especially for parallel simulations.

Advanced...

opens the Advanced Remeshing Settings Dialog Box (p. 5066), in which you can revise the default settings for the **Unified Remeshing** method.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Methods

contains options that control remeshing. This group box is only available if you have selected **Methods-Based Remeshing**.

Local Cell

allows you to remesh deforming boundary cells.

Local Face

allows you to remesh deforming boundary faces. This option is available for 3D cases.

Region Face

allows you to remesh a region.

2.5D

enables the 2.5D model. This option is only available for 3D cases. See Using the 2.5D Model (p. 1827) for more information.

Parameters

contains parameters that control remeshing. This group box is only available if you have selected **Methods-Based Remeshing**.

Minimum Length Scale

specifies the lower limit of cell size below which the cells are marked for remeshing.

Maximum Length Scale

specifies the upper limit of cell size above which the cells are marked for remeshing.

Maximum Cell Skewness

specifies the desired maximum skewness for the mesh.

Maximum Face Skewness

specifies the desired maximum skewness for the surface mesh. If you selected **Methods-Based Remeshing**, this option is only available when **Local Face** is enabled under **Methods**.

Size Remeshing Interval

specifies the interval in time steps for remeshing based on the above size criteria only. Marking of cells based on skewness occurs automatically at every time step when **Remeshing** is enabled. This field is only available if you have selected **Methods-Based Remeshing**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mesh Scale Info...

opens the Mesh Scale Info Dialog Box (p. 5067), in which you can view the statistics of the mesh, such as the minimum and maximum length scale values and the maximum cell and face skewness values.

Default

sets the fields in the **Parameters** group box to values that represent a reasonable starting point for your particular mesh, as determined by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

Reset

resets the fields in the **Parameters** group box to the prior values (that is, those displayed at the moment the **Default** button was clicked). After execution, the **Reset** button becomes the **Default** button.

Sizing Options

contains parameters that control the sizing function. This group box is only available if you have selected **Methods-Based Remeshing**.

Sizing Function

allows you to enable or disable the sizing function.

Resolution

sets the resolution for the sizing function. See Setting Dynamic Mesh Modeling Parameters (p. 1782) for more information.

Variation

specifies the value of α in Equation 12.22 (p. 1818).

Rate

specifies the value of β in Equation 12.23 (p. 1818).

Default

sets the sizing function parameters to the default values, as determined by Ansys Fluent based on the current mesh. After execution, the **Default** button becomes the **Reset** button.

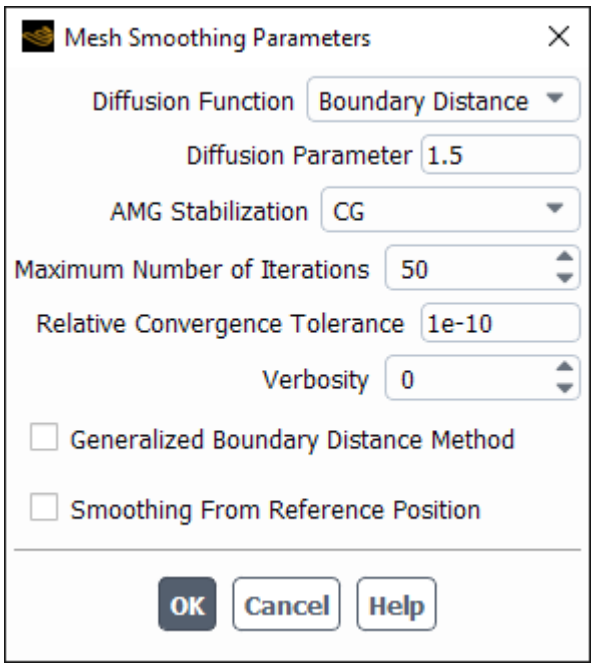
Reset

resets the sizing function parameters to the prior values (that is, those displayed at the moment the **Default** button was clicked). After execution, the **Reset** button becomes the **Default** button.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.9.2. Mesh Smoothing Parameters Dialog Box

The **Mesh Smoothing Parameters** dialog box is available by clicking the **Advanced...** button in the **Smoothing** tab of the Mesh Method Settings Dialog Box (p. 5060), and it allows you to define settings for the smoothing method.



Controls

Spring Constant Factor

controls the spring stiffness.

Convergence Tolerance

controls the smoothing convergence.

Maximum Number of Iterations

specifies the maximum number of iterations that will be attempted.

Elements

controls the elements where spring-based smoothing is applied.

Tet in Tet Zones

(3D only) specifies that only cell zones with all tetrahedral elements get smoothed.

Tet in Mixed Zones

(3D only) specifies that tetrahedral elements in mixed element zones get smoothed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Tri in Tri Zones

(2D only) specifies that only cell zones with all triangular elements get smoothed.

Tri in Mixed Zones

(2D only) specifies that triangular elements in mixed element zones get smoothed.

All

specifies that all element types get smoothed.

Laplace Node Relaxation

specifies how the update of the node positions is relaxed on boundaries where there is Laplacian smoothing.

Verbosity

specifies the level of detail printed to the console during the calculation. Setting this to 1 (for radial basis function smoothing) ensures that the absolute tolerance computed (based on your specified relative tolerance) is printed, or (for all other smoothing methods) ensures that smoothing residuals are printed; alternatively, the default value of 0 suppresses such output.

Diffusion Function

specifies whether the diffusion coefficient is a function of the **Boundary Distance** (Equation 12.3 (p. 1786)) or the **Cell Volume** (Equation 12.4 (p. 1786)). This drop-down list is only available for diffusion-based smoothing.

Diffusion Parameter

specifies α in Equation 12.3 (p. 1786) or Equation 12.4 (p. 1786), depending on the selected **Diffusion Function**. This number-entry box is only available for diffusion-based smoothing.

AMG Stabilization

selects the algebraic multigrid (AMG) stabilization method used by the linear solver to perform mesh smoothing calculations. This drop-down list is only available for smoothing based on diffusion (when using the finite element method) or the linearly elastic solid model.

Relative Convergence Tolerance

specifies the relative residual tolerance for smoothing based on diffusion, the linearly elastic solid model, or a radial basis function interpolation.

Generalized Boundary Distance Method

is an option that is available when you have selected **Boundary Distance** for the **Diffusion Function**, and it allows you to use of a "generalized" boundary distance for the diffusion coefficient calculation. When this option is enabled, the calculation uses the normalized distance to the nearest boundary that is not declared as deforming, regardless of type; when it is disabled, only wall boundaries are considered.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Local Smoothing

limits the amount of the domain that is smoothed to only those cells that are close to the moving boundary zones, to ensure that the mesh away from the moving boundary zones remains undisturbed by the smoothing, and to decrease the computational time required for smoothing. This option is available when the smoothing method is based on a radial basis function interpolation. For details, see Local Smoothing with the Radial Basis Function Smoothing Method (p. 1800).

Smoothing From Reference Position

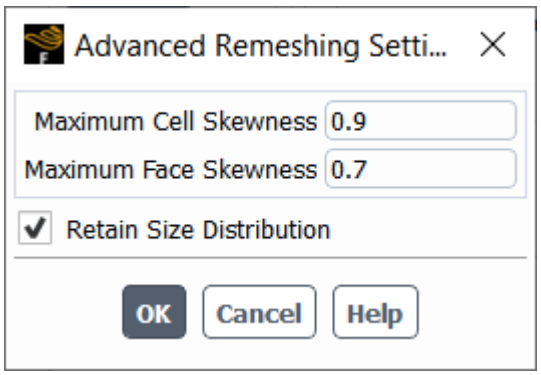
enables smoothing from a reference position. Such smoothing may produce greater mesh quality consistency for stationary or moving meshes with periodic or quasi-periodic motion. It is available when the smoothing method is based on diffusion, the linearly elastic solid model, or a radial basis function interpolation; it is not available with layering, remeshing, and/or automatic adaption.

Poisson's Ratio

specifies the linearly elastic solid material property ν in Equation 12.12 (p. 1797). This number-entry box is only available for smoothing based on the linearly elastic solid model.

50.9.3. Advanced Remeshing Settings Dialog Box

The **Advanced Remeshing Settings** dialog box allows you to revise the default settings for the **Unified Remeshing** method. For further details, see Unified Remeshing (p. 1829).



Controls

Maximum Cell Skewness

defines the maximum cell skewness in the zone.

Maximum Face Skewness

defines the maximum cell skewness in the surface mesh.

Retain Size Distribution

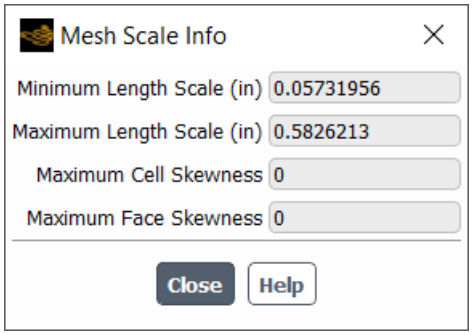
enables the use of local size criteria when marking cells for remeshing, in an attempt to maintain the initial mesh size distribution even as the mesh moves. When disabled, cells are instead marked when their length scales are outside of the minimum and maximum length scale values of the cell zone in the initial mesh. Either marking can be overridden if more restrictive values are specified

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

using the `define/dynamic-mesh/controls/remeshing-parameters/length-min` and `define/dynamic-mesh/controls/remeshing-parameters/length-max` text commands.

50.9.4. Mesh Scale Info Dialog Box

The **Mesh Scale Info** dialog box allows you to inspect the values of minimum and maximum length scale and maximum cell/face skewness in a mesh.



Controls

Minimum Length Scale

displays the minimum length scale in the mesh.

Maximum Length Scale

displays the maximum length scale in the mesh.

Maximum Cell Skewness

displays the maximum cell skewness in the zone.

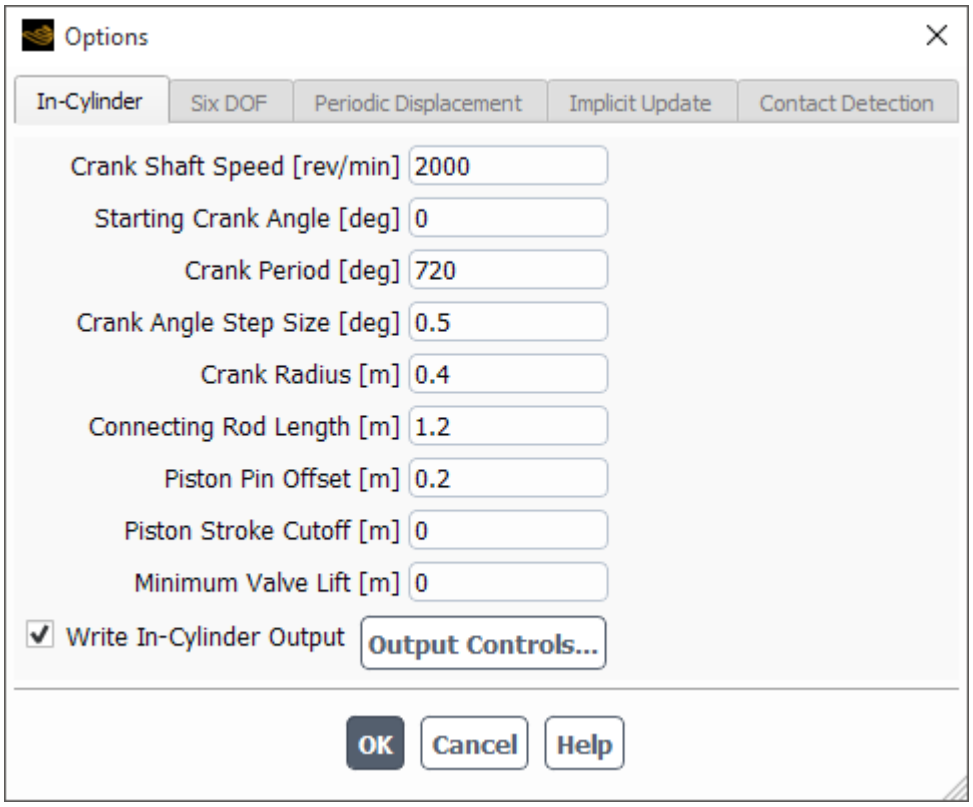
Maximum Face Skewness

displays the maximum cell skewness in the surface mesh.

50.9.5. Options Dialog Box

The **Options** dialog box allows you to set the parameters for the options available in the **Options** group box of the **Dynamic Mesh** task page.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

In-Cylinder

contains parameters to be specified for the in-cylinder model. See In-Cylinder Settings (p. 1836) for more information.

Crank Shaft Speed

specifies the speed of the crank shaft.

Starting Crank Angle

specifies the starting crank angle.

Crank Period

specifies the crank period.

Crank Angle Step Size

specifies the crank angle step size used to determine the time step size to advance the solution.

Crank Radius

specifies the crank radius to calculate the piston location.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Piston Pin Offset

specifies the perpendicular offset of the piston pin from the plane defined by the crank shaft axis and the direction of motion of the piston. The sign of this value is positive if top-dead-center (TDC) occurs prior to a crank angle of 0°.

Connecting Rod Length

specifies the length of the connecting rod.

Piston Stroke Cutoff

specifies the piston stroke cutoff used to control the onset of layering in the cylinder chamber.

Minimum Valve Lift

specifies the minimum valve lift.

Write In-Cylinder Output

enables or disables the writing of in-cylinder specific output parameters. When this option is enabled, the **Output Controls...** button becomes active.

Output Controls...

displays the In-Cylinder Output Controls Dialog Box (p. 5071) and is available only after the **Write In-Cylinder Output** option is enabled.

Six DOF

contains parameters to be specified for the six degrees of freedom (DOF) solver. See Six DOF Solver Settings (p. 1851) for more information.

Six DOF Properties

displays a list of defined sets of six DOF properties.

Create/Edit...

opens the Six DOF Properties Dialog Box (p. 5073).

Delete

removes the selected set of six DOF properties from the **Six DOF Properties** list.

Delete All

removes all sets of six DOF properties from the **Six DOF Properties** list.

Gravitational Acceleration

contains the text entry boxes for gravitational acceleration in X, Y, and Z directions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X, Y, Z

specifies the gravitational acceleration in X, Y, and Z directions respectively.

Write Motion History

allows you to keep track of an object's motion history.

File Name

allows you to specify a file name for saving the object's motion history.

Periodic Displacement

contains parameters to be specified for periodic displacement in blade flutter analysis. See Defining the Periodic Displacement of the Blades (p. 1946) for more information.

Periodic Displacement Groups

lists the currently available periodic displacement groups.

Create

creates a new periodic displacement group.

Edit

edits an existing periodic displacement group.

Delete

deletes an existing periodic displacement group.

Delete All

deletes all existing periodic displacement group.

Implicit Update

contains parameters to be specified for implicit mesh updating. See Implicit Update Settings (p. 1856) for more information.

Update Interval

allows you to specify the frequency in iterations at which the mesh will be updated within a time step.

Motion Relaxation

allows you to set a value (within the range of 0 to 1) for ω in Equation 12.29 (p. 1857), which defines the relaxation of the motion (that is, displacement of the nodes) during the mesh update.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Residual Criteria

allows you to set the relative residual threshold that is used to check the motion convergence.

Contact Detection

contains parameters to be specified for contact detection. See Contact Detection Settings (p. 1858) for more information.

Face Zones

allows you to select the face zones that will be involved in contact detection.

Proximity Threshold

allows you to set the threshold below which the user-defined function and/or flow control settings for contact detection will be invoked.

UDF

allows you to specify the user-defined function that will be invoked when contact has been detected.

Contact Region

contains controls that affect the flow in contact regions.

Flow Control

allows you to indicate whether you want the flow conditions to change for cells adjacent to faces zones that fall below the **Proximity Threshold** distance.

Settings...

opens the Flow Control Settings Dialog Box (p. 5080), where you can define flow control settings for the contact regions.

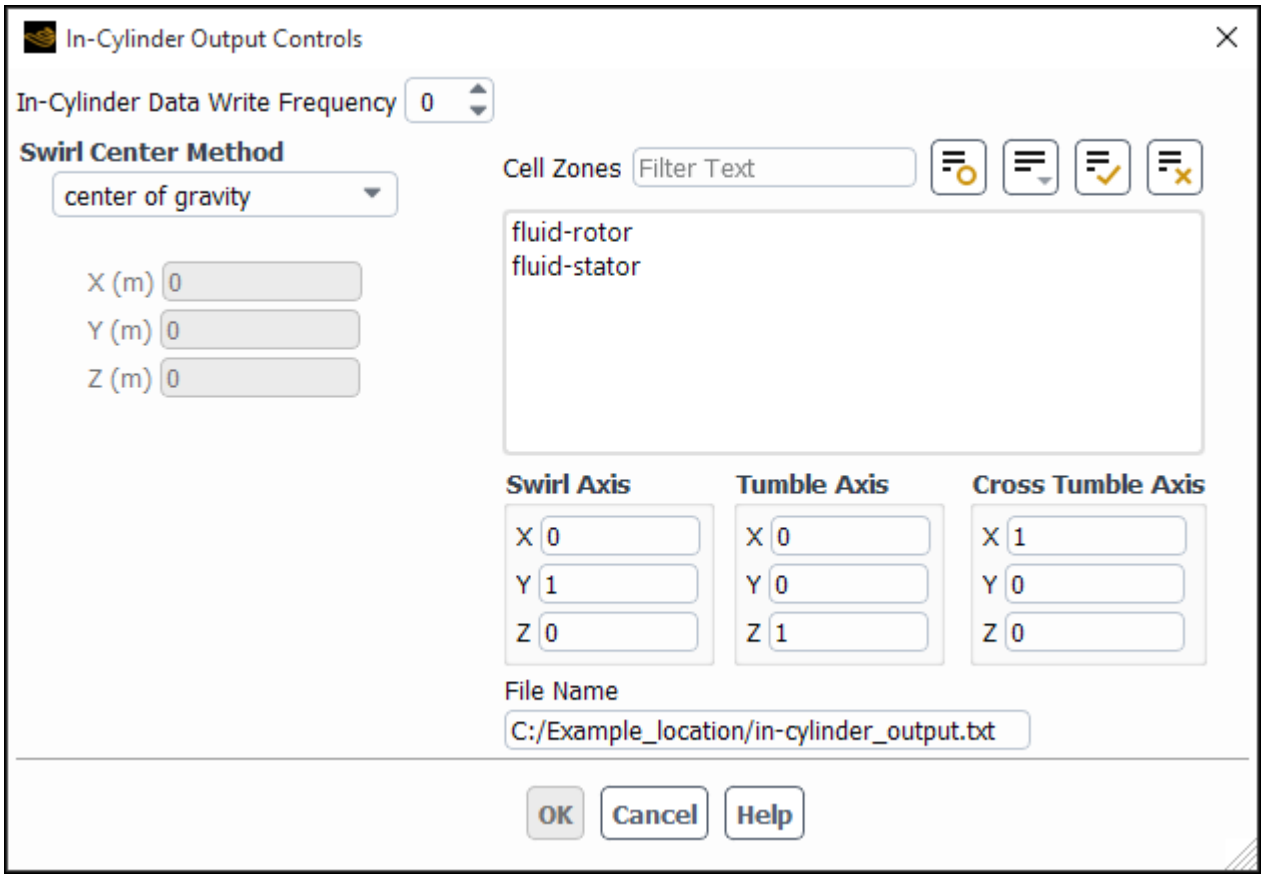
Update Contact Marks

updates which cells are marked in order to block flow in the contact region, using the current **Proximity Threshold** value. This button is only available when the **Contact Marks** method is selected in the Flow Control Settings Dialog Box (p. 5080).

50.9.6. In-Cylinder Output Controls Dialog Box

The **In-Cylinder Output Controls** dialog box contains parameters that control the output for the in-cylinder model. See In-Cylinder Settings (p. 1836) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

In-Cylinder Data Write Frequency

represents an integer entry specifying the interval in number of time-steps. Make sure that a value other than 0 is used for the frequency, in order to allow you to complete your setup.

Swirl Center Method

contains a drop-down list that allows you to select the method to calculate the swirl center. The list contains **center of gravity** and **fixed**, with **center of gravity** being the default value.

center of gravity

calculates the swirl center inside the code and is used as the center of gravity of the chosen cell zones.

fixed

enables you to specify a swirl center in the **X**, **Y**, and **Z** entry fields below the drop-down list.

In addition to these two options, you can chose to use your own **Compiled** user-defined function to calculate the swirl center. For details on using a dynamic mesh UDF, see the separate Fluent Customization Manual.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cell Zones

is a list that displays the names of all existing cell zones in the case files. You can select only the zones relevant for the swirl and tumble calculations.

Swirl Axis

specifies the swirl axis with three entries for the directional components. By default, **X**, **Y**, **Z**= **0**, **1**, **0**.

Tumble Axis

specifies the directional components of **Tumble Axis** in **X**, **Y**, **Z** directions. By default, **X**, **Y**, **Z** = **0**, **0**, **1**. This applies only in 3D.

Cross Tumble Axis

specifies the directional components of **Cross Tumble Axis** in **X**, **Y**, **Z** directions. By default, **X**, **Y**, **Z** = **1**, **0**, **0**. This applies only in 3D.

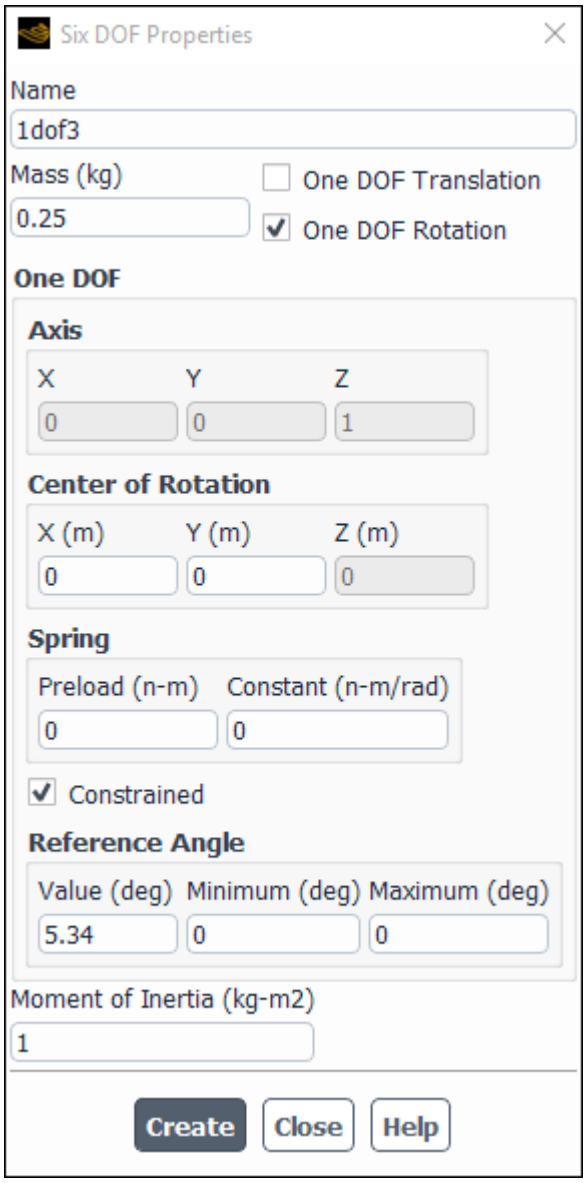
File Name

specifies the name of the **In-Cylinder** output file. By default, the file name contains the name of the case file appended with a `.txt` extension.

50.9.7. Six DOF Properties Dialog Box

The **Six DOF Properties** dialog box allows you to define a set of properties for a rigid body dynamic object that uses the **Six DOF** solver. The set of properties that you create can then be selected in the **Six DOF UDF/Properties** drop-down in the Dynamic Mesh Zones Dialog Box (p. 5086) for the zones that make up the object. See Setting Rigid Body Motion Attributes for the Six DOF Solver (p. 1853) and Rigid Body Motion (p. 1874) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the set of properties, which will be selectable in the **Six DOF UDF/Properties** drop-down in the Dynamic Mesh Zones Dialog Box (p. 5086).

Mass

defines the mass of the rigid body dynamic object.

One DOF Translation

specifies that the dynamic object will only undergo one DOF translation.

One DOF Rotation

specifies that the dynamic object will only undergo one DOF rotation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

One DOF

contains settings that define the one DOF translation or rotation.

Direction

defines the vector along which the object will be allowed to translate.

Axis

defines the components of the axis of rotation. Note that for 2D cases, the axis will be either the positive or negative *z* direction, depending on the sign of the value you enter for **Z**.

Center of Rotation

defines the point about which the object rotates. Note that this center of rotation can be different than the **Center of Gravity** defined in the Dynamic Mesh Zones Dialog Box (p. 5086).

Spring

contains settings that define an optional Hooke's law spring that can exert forces / torques on the object. It is a compression / extension spring for translations, and it is a torsion spring for rotations.

Preload

defines a spring load that is constantly applied to the object, in addition to the loading resulting from the spring **Constant**. The **Preload** can be a positive or negative value, and is defined relative to the **Direction** (for translation) or the **Axis** (for rotation).

Constant

defines the spring constant / rate.

Constrained

specifies that the range of motion of the object is limited, as defined by the settings in the **Reference Point** group box (for translation) or the **Reference Angle** group box (for rotation).

Reference Point

contains settings that define the limits of the object's translation when the **Constrained** option is enabled.

Location

assigns a coordinate value to a point located on the object in its initial position; the **Minimum** and **Maximum** coordinates are then defined relative to this value along the **Direction** vector, in order to establish the limits of translation.

Minimum

defines the lower extent of the constrained translation along the **Direction** vector, relative to the **Location**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maximum

defines the upper extent of the constrained translation along the **Direction** vector, relative to the **Location**.

Reference Angle

contains settings that define the limits of the object's rotation when the **Constrained** option is enabled.

Value

assigns an angular coordinate value to the orientation of the object in its initial position; the **Minimum** and **Maximum** angles are then defined relative to this orientation about the axis of rotation, in order to establish the limits of rotation.

Minimum

defines the lower extent of the constrained rotation about the axis of rotation, relative to the **Value**.

Maximum

defines the upper extent of the constrained rotation about the axis of rotation, relative to the **Value**.

Moment of Inertia

defines the moment of inertia for the rigid body dynamic object that undergoes one degree of freedom (DOF) rotation. Note that the values are relative to the **Center of Rotation** and **Axis** settings.

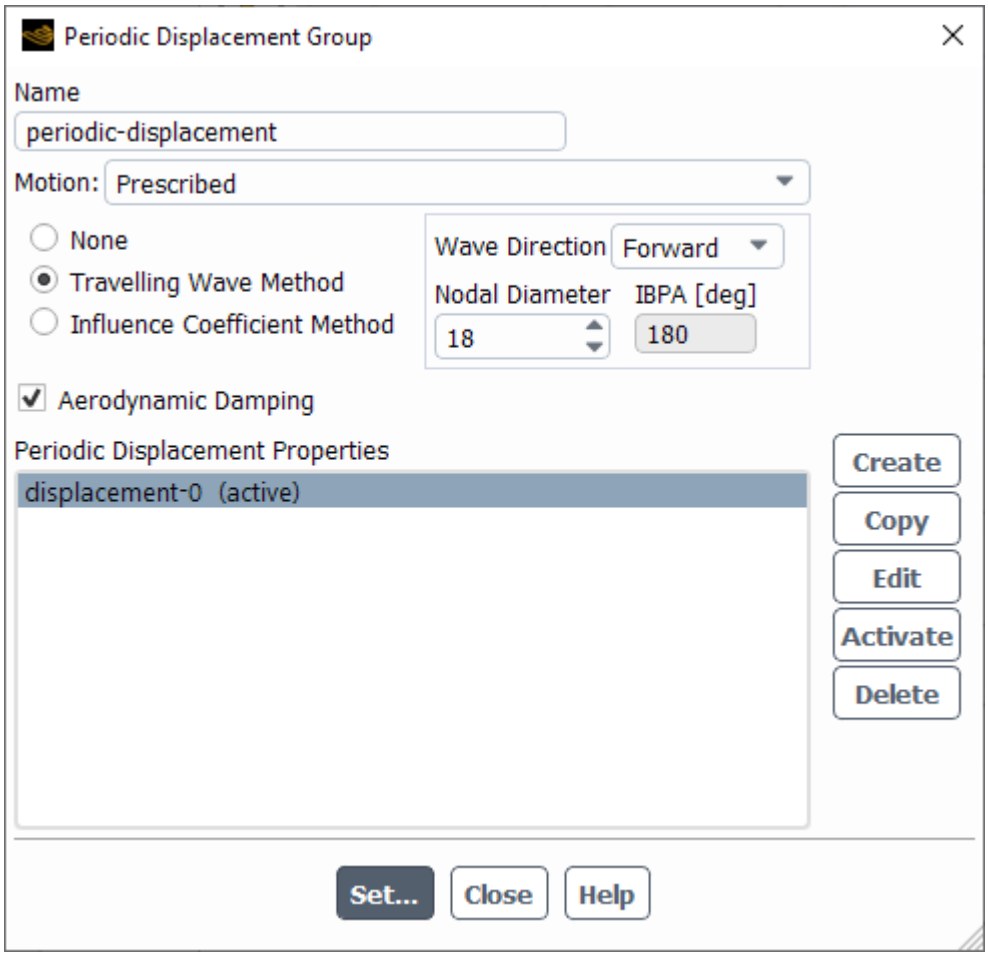
Inertia Tensor

defines the components of the inertia tensor for the object during six DOF motion. Note that the values are relative to the **Center of Gravity** and **Rigid Body Orientation** settings defined in the Dynamic Mesh Zones Dialog Box (p. 5086).

50.9.8. Periodic Displacement Group Dialog Box

The **Periodic Displacement Group** dialog box allows you to quickly run different mode shapes by having different displacements activated under each group. See Defining the Periodic Displacement of the Blades (p. 1946) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the periodic displacement group.

Motion

currently the only option is **Prescribed** with **None** (no wave), **Travelling Wave Method**, or **Influence Coefficient Method**.

Wave Direction

(only with Travelling Wave Method) specifies the direction of the wave as Forward or Backward.

Nodal Diameter

(only with Travelling Wave Method) specifies the vibration of the blades with **Interblade Phase Angle** (IBPA) which results in a traveling wave pattern. For complex mode shapes that are generated with cyclic symmetry, the mode shape profile is already phase-shifted so the IBPA is not needed. For real only mode shapes, you must supply information about the IBPA.

Periodic Displacement Properties

allows the definition of multiple periodic displacements.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create

creates a new periodic displacement.

Copy

creates a copy of an existing periodic displacement.

Edit

edits an existing periodic displacement.

Activate

activates a periodic displacement for the current run. The `(active)` suffix will appear next to the currently active displacement.

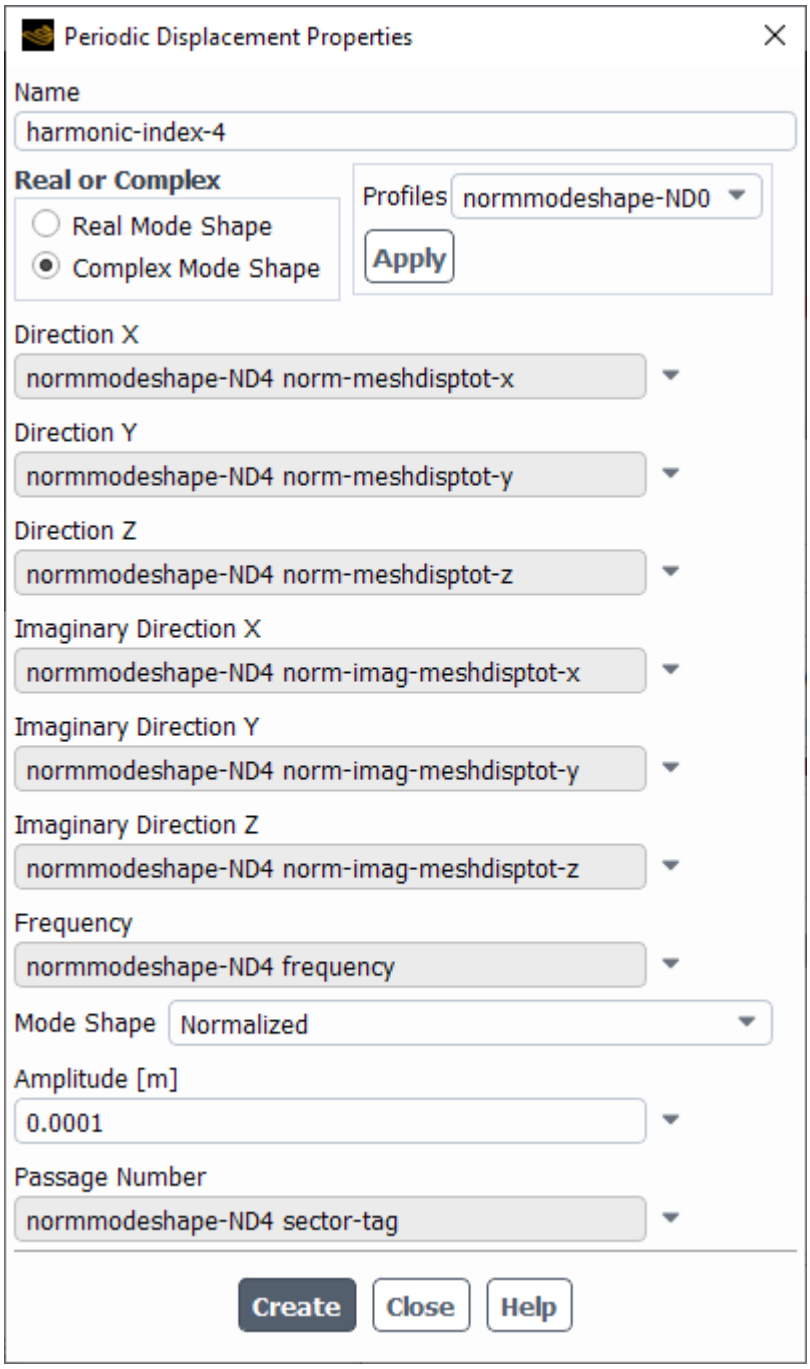
Delete

deletes a periodic displacement.

50.9.9. Periodic Displacement Properties Dialog Box

The **Periodic Displacement Properties** dialog box allows specify periodic displacement for an aerodynamic damping calculation. See Defining the Periodic Displacement of the Blades (p. 1946) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the periodic displacement.

Real or Complex

specifies the mode shape as real or complex.

Profiles

enables you to apply a displacement profiles to the appropriate fields.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction X,Y,Z

specifies the real displacement components typically using a mode shape profile.

Imaginary Direction X,Y,Z

(only available for Complex mode shape) specifies the imaginary displacement components typically using a mode shape profile.

Frequency

specifies the mode shape frequency.

Mode Shape

specifies whether the mode shape is **Normalized** or **Non-normalized**.

Amplitude

specifies the amplitude for normalized mode shapes to obtain the maximum modal displacement.

Scaling

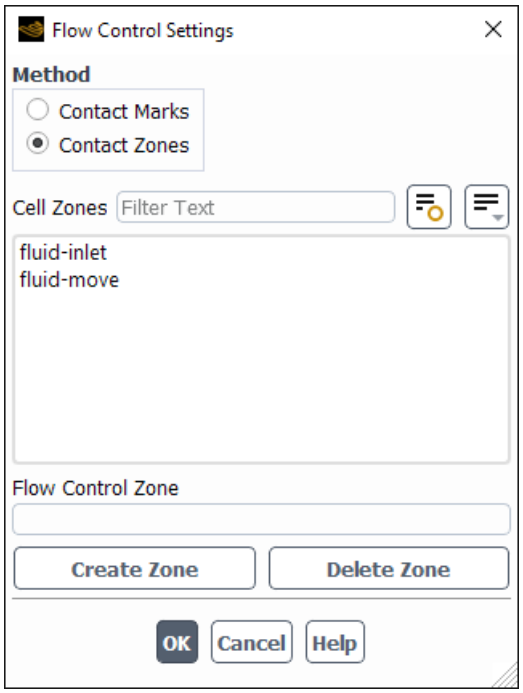
specifies the scaling parameter for non-normalized mode shapes to scale the displacement vectors.

Passage Number

specifies the sector tag, typically from the mode shape profile.

50.9.10. Flow Control Settings Dialog Box

The **Flow Control Settings** dialog box allows you to define flow control settings for the contact regions. See Contact Detection Settings (p. 1858) for more information.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Method

allows you to select how the flow is controlled when contact is detected.

Contact Marks

specifies that cells in the contact region are marked and then treated with boundary zone conditions that block the flow.

Contact Zones

specifies that cells in the contact regions are separated into new cell zones that have revised physical properties (for example, inertial and/or viscous porous resistance) that restrict the flow. The physical properties are copied from the respective flow control zones, which are created using the other controls in this dialog box.

Solution Stabilization

enables the performance of additional iterations per time step and the application of solution controls to improve the stability of the solver during contact, as part of the contact marks method.

Cell Zones

selects a cell zone that provides the initial physical properties of a flow control zone.

Flow Control Zone

specifies a new name for or displays the existing name of a flow control zone for the selection in the **Cell Zones** list.

Create Zone

creates a flow control zone (based on the selection from the **Cell Zones** list, with the **Porous Zone** option enabled), and opens the **Fluid** dialog box so you can revise the settings to better represent the restricted flow.

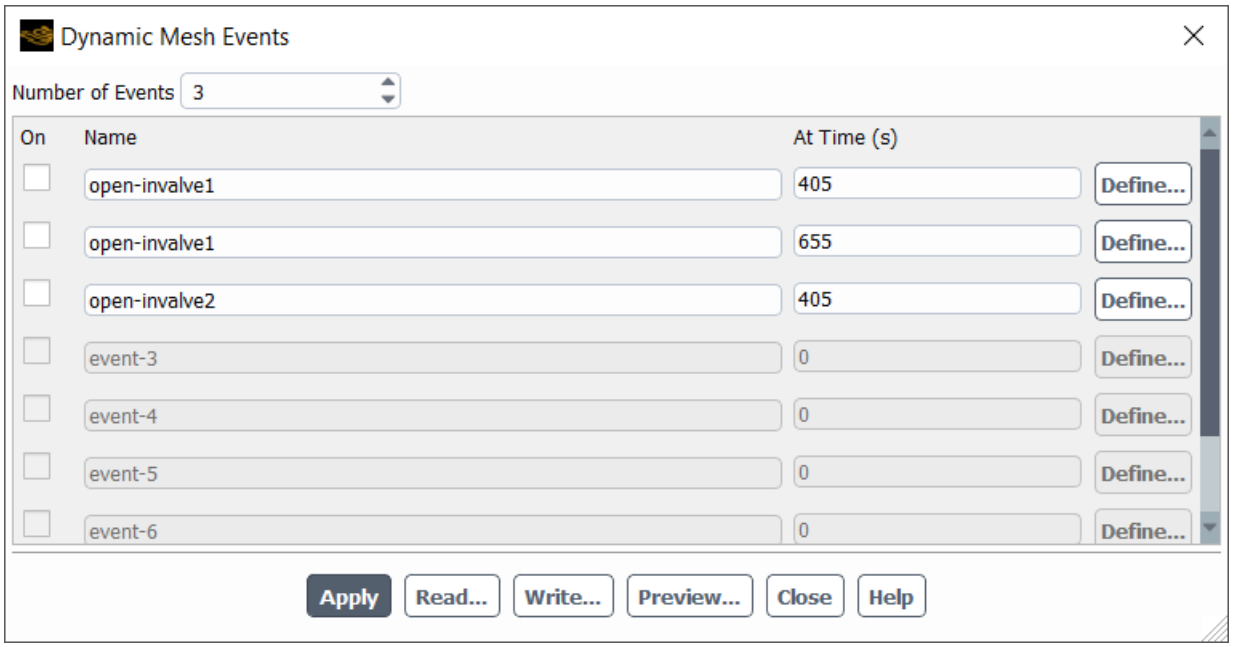
Delete Zone

deletes the current **Flow Control Zone**.

50.9.11. Dynamic Mesh Events Dialog Box

The **Dynamic Mesh Events** dialog box is available to control the timing of specific events during the course of the simulation. See Defining Dynamic Mesh Events (p. 1862) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Number of Events

specifies the number of events to be defined.

On

enables the corresponding event.

Name

specifies the name of the event.

At Crank Angle

specifies the angular location of the crank at which the event should occur. This option appears for in-cylinder flows.

At Time

specifies the time (in seconds) at which you want the event to occur. This option appears for non-in-cylinder flows.

Define...

opens the Define Event Dialog Box (p. 5083).

Read...

opens The Select File Dialog Box (p. 907).

Write...

opens The Select File Dialog Box (p. 907).

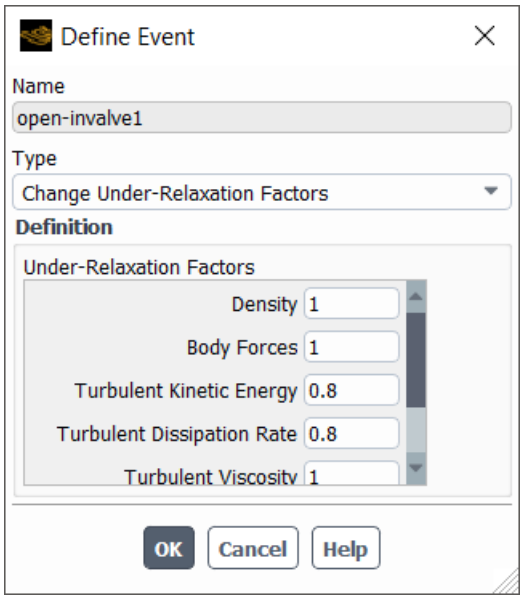
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Preview...

opens the Events Preview Dialog Box (p. 5085).

50.9.12. Define Event Dialog Box

The **Define Event** dialog box allows you to define events.



Controls

Name

contains the name of the event to be defined.

Type

specifies the type of event. You can choose the type of event from the drop-down list. These event types and their definitions are described in Events (p. 1866).

Definition

contains the input parameters corresponding to the type of event selected under **Type**.

Zone

contains a selectable list of the zones. The selection specifies the name of the zone(s) to be changed. This item will appear only for the **Change Zone Type** event.

New Zone Type

specifies the type of zone to which an existing zone must be changed. This item will appear only for the **Change Zone Type** event.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

From Zone

specifies the name of the zone from which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.

To Zone(s)

specifies the name of the zone to which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.

Zone(s)

contains a selectable list of the zones. The selection specifies the name of the zone to be activated/deactivated. This item will appear only for the **Activate Cell Zone** and **Deactivate Cell Zone** events.

Interface Name

contains the name of the interface to be created or deleted. This item will appear only for the **Create Sliding Interface** and **Delete Sliding Interface** events.

Interface Zone 1, Interface Zone 2

specifies the two zones on either side of the interface to be created. This item will appear only for the **Create Sliding Interface** event.

Wall 1 Motion, Wall 2 Motion

specifies the dynamic zones whose motion can be copied for the zones specified under **Interface Zone 1** and **Interface Zone 2**. This item will appear only for the **Create Sliding Interface** event.

Attribute

allows you to select the relevant motion attribute. This item will appear only for the **Change Motion Attribute** event.

Status

allows you to enable or disable the motion attribute. This item will appear only for the **Change Motion Attribute** event.

Dynamic Mesh Zones

contains a list of dynamic zones. This item will appear only for the **Change Motion Attribute** event.

Crank Angle Step Size

specifies the new physical time step size in degrees. This item will appear only for the **Change Time Step Size** event.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Base Dynamic Zone

specifies the zone from which the layer of cells is to be created. This item will appear only for the **Insert Boundary Layer** and **Remove Boundary Layer** event.

Side Dynamic Zone

represents the deforming face zone adjacent to the **Base Dynamic Zone** before the layer is inserted. This item will appear only for the **Insert Boundary Layer** event.

Internal Zone 1 Name, Internal Zone 2 Name

specifies the name of the new internal zones.

Time Step Size

allows you to change the time step size of the event. This item will appear only for the **Change Time Step Size** event.

Under-Relaxation Factors

allows you to specify the under-relaxation factors for the selected event. This item will appear only for the **Change Under-Relaxation Factors** event. See Setting Under-Relaxation Factors (p. 3575) for details.

Adjacent Dynamic Face Zone

allows you to select the dynamic face zone adjacent to the location of the cell layer to be inserted (or deleted). You can select the required zone from the drop-down list.

Direction Parameter

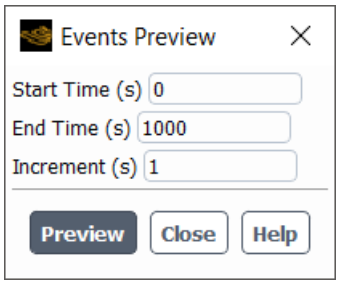
is the direction with respect to the selected dynamic face zone a layer of cells is removed or added.

Command

specifies the series of text / Scheme commands or the macro to be executed during the simulation. This item will appear only for the **Execute Command** event.

50.9.13. Events Preview Dialog Box

The **Events Preview** dialog box allows you to play the events to check that they are defined correctly.



Controls

Start Crank Angle

specifies the crank angle at which you want to start the preview (for in-cylinder flows).

Start Time

specifies the time at which you want to start the preview (for non-in-cylinder flows).

End Crank Angle

specifies the crank angle at which you want to end the preview (for in-cylinder flows).

End Time

specifies the time at which you want to end the preview (for non-in-cylinder flows).

Increment

specifies the size of the step to take during the preview.

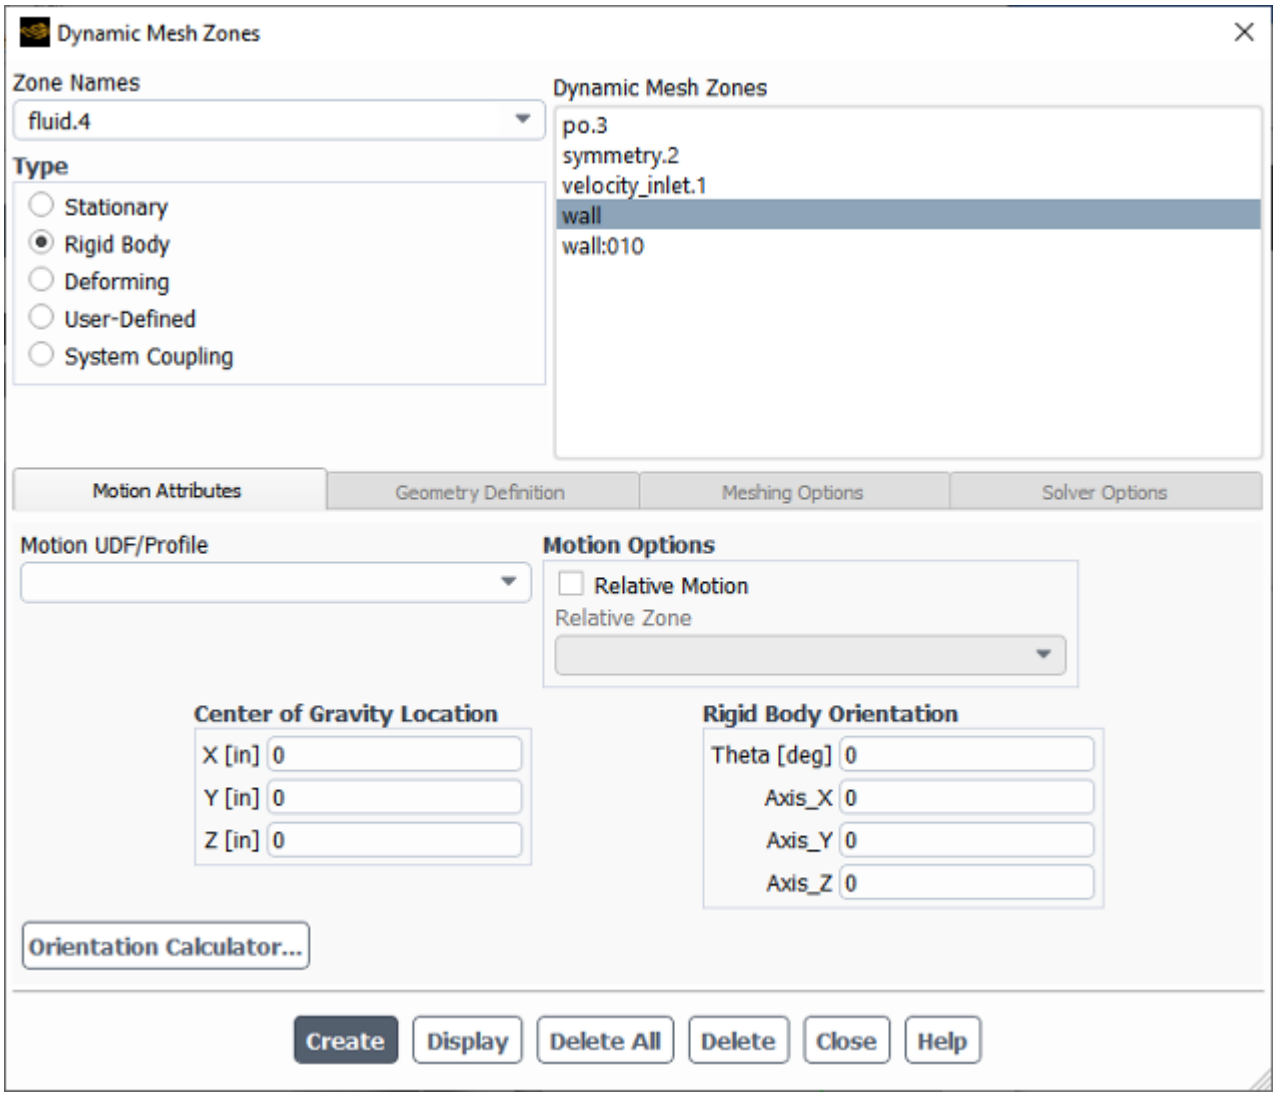
Preview

plays back the events at the crank angle specified for each event and reports when each event occurs in the text (console) window.

50.9.14. Dynamic Mesh Zones Dialog Box

The **Dynamic Mesh Zones** dialog box allows you to specify the motion of the dynamic zones in your model. See Specifying the Motion of Dynamic Zones (p. 1872) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Names

contains the names of the zones in the model.

Type

contains the types of motion that can be specified for a dynamic zone.

Stationary

explicitly declares the zone as stationary, so that the nodes on this zone are excluded when updating the node positions. See Specifying the Motion of Dynamic Zones (p. 1872) for more information.

Rigid Body

specifies the zone as having a rigid-body motion.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Deforming

specifies the zone as deforming.

User-Defined

enables you to specify a user-defined zone motion.

System Coupling

allows the zone to be involved in a system coupling simulation where the motion is defined by the application that Ansys Fluent is coupled with on this zone (see the Fluent in Workbench User's Guide and the System Coupling User's Guide for more details). Once enabled, the **Solver Options** tab can be used to help achieve convergence for system coupling cases where the physics is strongly coupled. If a dynamic mesh zone of the type **System Coupling** exists, and Ansys Fluent is not involved in a system coupling simulation, then this zone type behaves in the same way as a stationary zone.

Intrinsic FSI

specifies that a wall zone between a fluid and solid cell zone deforms according to the deformation of the adjacent solid zone as part of a two-way intrinsic fluid-structure interaction (FSI) simulation. Note that this type can only be used for the side of a two-sided wall (that is, the wall or wall-shadow) that is immediately adjacent to the fluid cell zone (as indicated by the **Adjacent Cell Zone** field in the **Wall** dialog box). This option is only available when a model is selected in the Structural Model Dialog Box (p. 4817).

Dynamic Mesh Zones

lists all of the dynamic zones in the case.

Motion Attributes

contains parameters to specify the motion attributes for a rigid-body-motion zone, a deforming-motion zone, or a user-defined-motion zone.

Motion UDF/Profile

allows you to define the motion of the rigid body zone by selecting a profile or user-defined function from the drop-down list. See Profiles (p. 1540) and Solid-Body Kinematics (p. 1887) for information on profiles, and see the Fluent Customization Manual for information on user-defined functions.

Six DOF UDF/Properties

allows you to define the motion of a rigid body zone by selecting a profile, user-defined function, or set of six DOF properties (created using the Six DOF Properties Dialog Box (p. 5073)) from the drop-down list. This option is available only when **On** is enabled in the **Six DOF** group box.

Six DOF

contains parameters for the **Six DOF** solver.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

On

enables the use of the **Six DOF** solver.

Passive

(if enabled) does not take forces and moments on the zone into consideration.

Center of Gravity Location

specifies the initial values of the coordinates for the location of the center of gravity of the selected zone. This item will appear only if the motion **Type** is **Rigid Body** and **In-Cylinder** is not enabled in the **Dynamic Mesh** task page. After calculating, Ansys Fluent updates these fields, allowing you to keep track of the object's current location.

Motion Options

provides a **Relative Motion** option, which allows you to specify that the motion of the dynamic zone is relative to another pre-defined rigid body zone. This group box will only appear if the **Type** is **Rigid Body** or **User-Defined**; for the latter, the **Relative Zone** must be a cell zone.

Rigid Body Orientation

specifies the initial values that define the orientation of the rigid body of the selected zone. This item will appear only if the motion **Type** is **Rigid Body** and **In-Cylinder** is not enabled in the **Dynamic Mesh** task page. After calculating, Ansys Fluent updates these fields, allowing you to keep track of the object's current orientation. The rigid body orientation is used, if needed, by the six DOF solver to evaluate the external load forces and moments (see `DEFINE_SDOF_PROPERTIES` in the *Fluent Customization Manual*), as well as when evaluating the relative motion of a dynamic zone with respect to another (see `DEFINE_CG_MOTION` in the *Fluent Customization Manual*).

Center of Gravity Velocity

specifies the velocity of the center of gravity with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

Rigid Body Angular Velocity

specifies the angular velocity of the rigid body with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

Lift/Stroke

contains the current value of valve lift or piston stroke, which is automatically updated when you click **Create**. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh** task page.

Valve/Position Axis

specifies the direction of the reference axis of the valves or piston for an in-cylinder problem. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh** task page.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mesh Motion UDF

allows you to select the user-defined function that defines the geometry and motion of the zone. This item will appear only if the motion **Type** is **User-Defined**.

Exclude Mesh Motion in Boundary Conditions

allows you to specify whether the boundary mesh motion is excluded in the physical boundary conditions of that zone. This option is only available for non-periodic boundary zones.

Geometry Definition

contains parameters to define a deforming zone.

Definition

allows you to select a geometry definition to project nodes of the deforming zone on. Available options are **faceted**, **plane**, **cylinder**, and **user-defined**. When the linearly elastic solid mesh smoothing method or the radial basis function smoothing method is enabled (see Linearly Elastic Solid Based Smoothing Method (p. 1796) or Radial Basis Function Smoothing (p. 1798), respectively), you also have the option of selecting **unspecified**. If you have created auxiliary geometry definitions (as described in Managing Auxiliary Geometry Definitions (p. 1759)), the names of the definitions will be available for selection in the list preceded by **geom::**.

Feature Options

allows you to preserve features for 3D cases on boundary zones of type **Deforming** or **User-Defined**. Such features may be at the juncture of different boundary zones, or they may be on a single non-planar boundary zone.

Feature Detection

enables the detection and preservation of features of a particular angular range.

Feature Angle

defines a threshold value in degrees. For details on how this angle is defined, see Feature Detection (p. 1836).

Point on Plane

allows you to specify the position of a point on the plane. This item will appear only when you select **plane** for the **Definition**.

Plane Normal

allows you to specify the direction of the plane normal. This item will appear only when you select **plane** for the **Definition**.

Cylinder Radius

allows you to specify the radius of the cylinder. This item will appear only when you select **cylinder** for the **Definition**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cylinder Origin

allows you to specify the location of the cylinder origin. This item will appear only when you select **cylinder** for the **Definition**.

Cylinder Axis

allows you to specify the direction of the cylinder axis. This item will appear only when you select **cylinder** for the **Definition**.

Geometry UDF

allows you to select a user-defined function for a geometry **Definition**.

Meshing Options

contains parameters for various meshing options.

Adjacent Zone

contains the name of the adjacent zone that is involved in local remeshing or dynamic layering. This item will appear only if the zone type is **Stationary**, **Rigid Body**, **User-Defined**, or **Intrinsic FSI**.

Cell Height

allows you to specify the ideal height of the adjacent cells as either a constant value or a compiled user-defined function. This item will appear only if the motion **Type** is **Stationary**, **Rigid Body**, **User-Defined**, or **Intrinsic FSI**.

Deform Adjacent Boundary Layer with Zone

enables the smoothing of an adjacent boundary layer mesh. This option is not available when **Stationary** or **Deforming** is selected in the **Type** list.

Remeshing

enables remeshing for a deforming zone, and allows you to use the settings in the group box below to specify whether the global settings defined in the **Remeshing** tab of the Mesh Method Settings Dialog Box (p. 5060) are applied to this zone. The settings that are available in the group box are based on whether you are defining a boundary zone or a cell zone, and on the global remeshing settings.

Parameters

provides remeshing settings for boundary zones or cell zones.

Global Settings

allows you to specify that this deforming zone uses the settings you defined globally in the **Remeshing** tab of the **Mesh Method Settings** dialog box. When this option is disabled, you can use the other settings under **Parameters** to define unique local remeshing criteria.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Minimum Length Scale

specifies the lower limit of cell size below which the cells are marked for remeshing for the zone.

Maximum Length Scale

specifies the upper limit of cell size above which the cells are marked for remeshing for the zone.

Maximum Skewness

specifies the desired value for maximum skewness in the zone.

Zone Scale Info...

opens the Zone Scale Info Dialog Box (p. 5096), in which you can view the statistics of the zone, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

Options

provides remeshing options for the zone. This group box is only available if you have selected **Methods-Based Remeshing** in the **Remeshing** tab of the Mesh Method Settings Dialog Box (p. 5060).

Region

enables the region-based remeshing method for boundary zones.

Local

enables the local face remeshing method for boundary zones.

Smoothing

enables smoothing for a deforming zone, and allows you to use the settings in the group box below to specify whether the global settings defined in the **Smoothing** tab of the Mesh Method Settings Dialog Box (p. 5060) dialog box and the Mesh Smoothing Parameters Dialog Box (p. 5064) are applied to this zone. The settings that are available in the group box are based on whether you are defining a boundary zone or a cell zone, and on the global smoothing settings.

Elements

allows you to specify the element types for which spring-based smoothing is used in this zone. This will only be available if you are defining a cell zone and the **Spring/Laplace/Boundary Layer** method has been selected in the **Smoothing** tab of the **Mesh Method Settings** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Global Settings

allows you to specify that this deforming zone smooths the element types you specified globally in the Mesh Smoothing Parameters Dialog Box (p. 5064). When this option is disabled, you can make a unique local selection using the radio buttons below.

Tet in Tet Zones

(3D only) specifies that this zone will get smoothed only if it consists entirely of tetrahedral elements.

Tet in Mixed Zones

(3D only) specifies that all tetrahedral elements in this zone should get smoothed. All other elements in a mixed element zone will not undergo smoothing.

Tri in Tri Zones

(2D only) specifies that this zone will get smoothed only if it consists entirely of triangular elements.

Tri in Mixed Zones

(2D only) specifies that all triangular elements in this zone should get smoothed. All other elements in a mixed element zone will not undergo smoothing.

All

specifies that all element types in this zone will get smoothed.

Methods

allows you to specify the smoothing method for the zone. This is only available if you are defining a boundary zone and the **Spring/Laplace/Boundary Layer** method has been selected in the **Smoothing** tab of the **Mesh Method Settings** dialog box.

Spring

enables the spring-based smoothing method for this zone.

Laplace

enables the Laplacian smoothing method for this zone.

Remeshing Method

provides settings for local face remeshing of the dynamic zone. This group box will appear only for boundary zones, when the motion **Type** is **User-Defined**.

Local

enables local face remeshing for the dynamic zone. This option is only available when **Unified Remeshing** is selected or **Local Face** is enabled in the **Remeshing** tab of the Mesh Method Settings Dialog Box (p. 5060).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maximum Skewness

is a field that, if revised (with a reasonable value), sets a maximum skewness for the local face remeshing of the dynamic zone that is different than the global value set in the **Remeshing** tab of the Mesh Method Settings Dialog Box (p. 5060).

Solver Options

contains settings that may help convergence for boundary zones in cases that involve strong fluid-structure interaction (notably zones undergoing rigid body motion with the six degrees of freedom solver, system coupling motion, or two-way intrinsic FSI motion). See Solution Stabilization for Dynamic Mesh Boundary Zones (p. 1886) for more information.

Solution Stabilization

enables/disables solution stabilization settings for boundary zones.

Stabilization Parameters

contains options for solution stabilization settings.

Scale Factor

allows you to set the scale factor used by the selected **Method** for convergence stabilization.

Method

Stabilization is achieved through a boundary source coefficient introduced in the continuity equation. It is designed to improve the diagonal dominance of the matrix system in the cells adjacent to the boundary zone. Two methods for this boundary source coefficient are available:

volume-based

specifies that the diagonal entry of the linear matrix system corresponding to the discretized continuity equation is re-scaled using the cell volume and a scale factor, according to Equation 12.32 (p. 1886).

coefficient-based

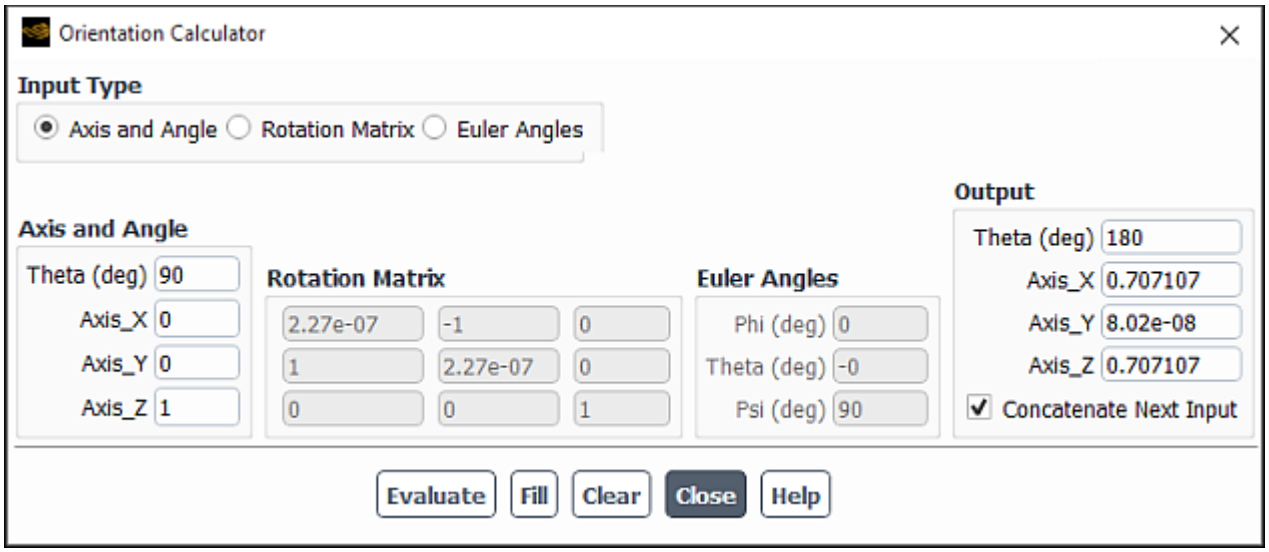
(default) specifies that the diagonal entry of the linear matrix system corresponding to the discretized continuity equation is directly re-scaled by a scale factor, according to Equation 12.33 (p. 1887).

50.9.15. Orientation Calculator Dialog Box

The **Orientation Calculator** dialog box allows you to convert rotation matrices and Euler angles to axis and angle format. It also allows you to concatenate rotations to determine a rigid body's final orientation. The output of this calculator can then be used to fill in the initial rigid body orientation of your rigid body motion dynamic zone, which can be used to track the orientation during the calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 50.3: Orientation Calculator Dialog Box



Controls

Input Type

allows you to select which method you will use to enter your rigid body orientation values. For additional information about these input types, see Rigid Body Motion (p. 1874).

Axis and Angle

allows you to enter the angle of rotation and the axis about which the rigid body is rotating.

Rotation Matrix

allows you to enter the orientation of the rigid body as a rotation matrix.

Euler Angles

allows you to enter the orientation of the rigid body as a set of Euler Angles. For an explanation of which Euler angles method Fluent uses, see Rigid Body Motion (p. 1874).

Output

displays the angle of rotation and the axis about which the rigid body is rotating after you click **Evaluate**.

Note that if you enter a single orientation in **Axis and Angle** and click **Evaluate**, the values shown in **Output** will be the same as you entered in **Axis and Angle**

Concatenate Next Input

concatenates the next input entered (after clicking **Evaluate**) to the values displayed in **Output**

Evaluate

converts the specified input values into angle and axis format and displays the results in **Output**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

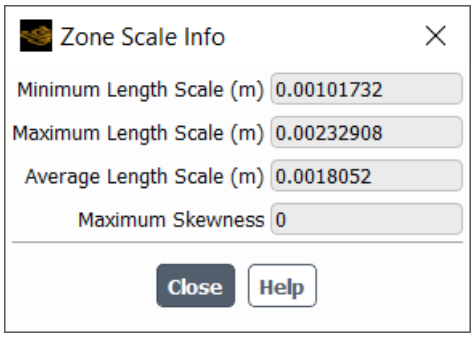
Note that the calculator also converts the entered values into the other two "grayed-out" input formats.

Fill

enters the values displayed in **Output** into the **Rigid Body Orientation** fields of the **Dynamic Mesh Zones** dialog box.

50.9.16. Zone Scale Info Dialog Box

The **Zone Scale Info** dialog box allows you to inspect the values of minimum and maximum cell area or volume, and maximum cell skewness in a zone.



Controls

Maximum Length Scale

displays the maximum cell length in the zone.

Minimum Length Scale

displays the minimum cell length in the zone.

Average Length Scale

displays the average cell length in the zone.

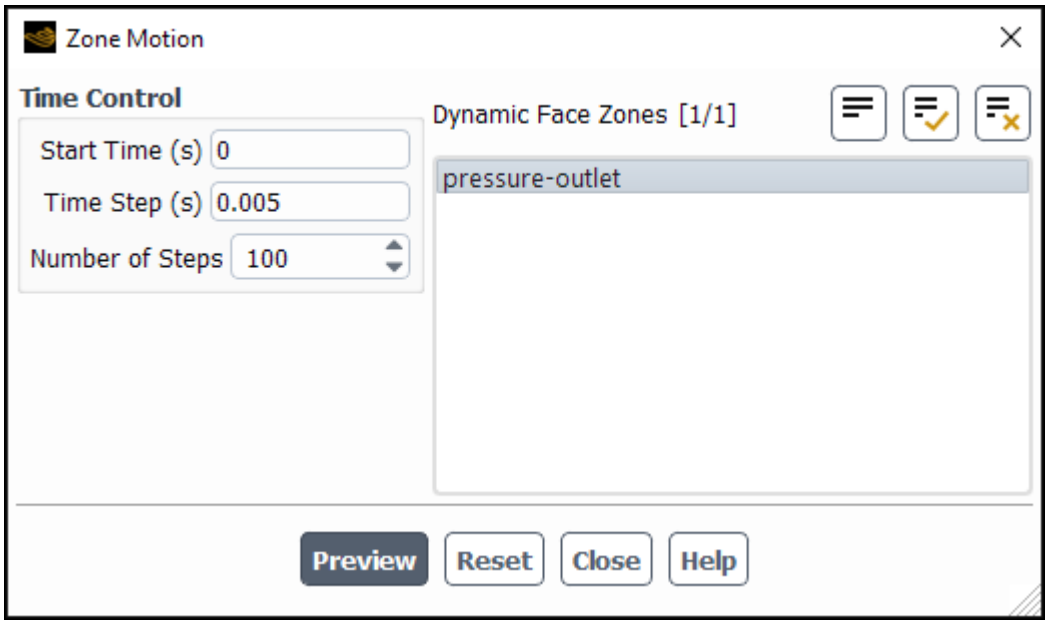
Maximum Skewness

displays the maximum cell skewness in the zone.

50.9.17. Zone Motion Dialog Box

The **Zone Motion** dialog box will display the motion of zones specified with **Rigid Body** or **User-Defined** motion. See Previewing the Dynamic Mesh (p. 1890) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Time Control

contains controls to specify the time intervals at which to display the motion.

Start Time (s)

specifies the time from which to start the zone motion preview.

Time Step (s)

specifies time step size for zone motion preview.

Number of Steps

specifies number of time steps for zone motion preview.

Dynamic Face Zones

allows you to select the dynamic face zones to preview. Only **User-Defined** or **Rigid Body** zones are available.

Preview

previews the zone motion.

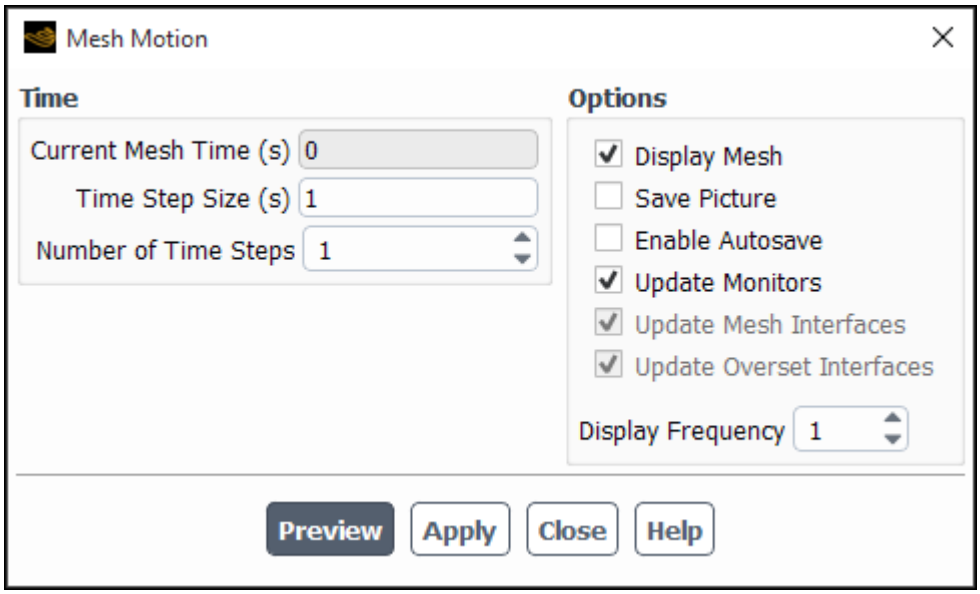
Reset

resets the zone display and the dialog box inputs.

50.9.18. Mesh Motion Dialog Box

The **Mesh Motion** dialog box allows you to preview the dynamic mesh as it changes with time before you start your simulation. See Previewing the Dynamic Mesh (p. 1890) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Time

contains the parameters to specify the time interval at which to update the mesh.

Current Mesh Time

displays the current time after the dynamic mesh has been advanced the specified number of steps.

Time Step Size

specifies the size of each time step.

Number of Time Steps

specifies the number of time steps.

Options

contains options to view the updated mesh.

Display Mesh

displays the mesh.

Save Picture

opens the Save Picture Dialog Box (p. 5200), allowing you to save a picture file of the mesh each time Ansys Fluent updates it during the mesh preview.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Enable Autosave

opens the Autosave Case During Mesh Motion Preview Dialog Box (p. 5099), allowing you to save the case and data files with the specified name and frequency. See Automatic Saving of Case and Data Files (p. 934) for details.

Update Mesh Interfaces

allows you to update the interface at every time step.

Update Monitors

allows you to disable the processing of monitors and computation activities during mesh motion preview.

Display Frequency

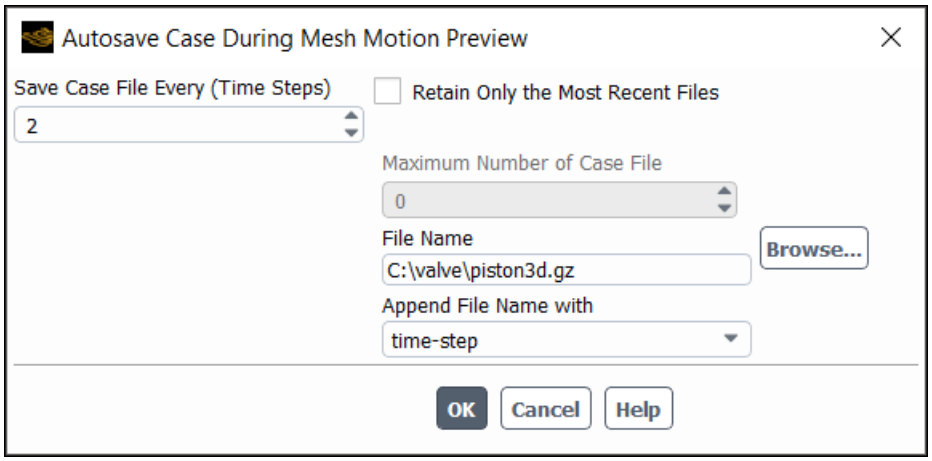
displays the frequency at which Ansys Fluent will update the mesh display.

Preview

allows you to preview the motion of the selected zones in the graphics window.

50.9.19. Autosave Case During Mesh Motion Preview Dialog Box

The **Autosave Case During Mesh Motion Preview** dialog box allows you to automatically save your case during the dynamic mesh preview as it changes with time, while running your simulation. See Automatic Saving of Case and Data Files (p. 934) for details about the inputs.



Controls

Save Case File Every

contains the parameters to specify the time interval at which to update the mesh.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Retain Only the Most Recent Files

allows you to restrict the number of files saved by Ansys Fluent if you have limited disk space. When this option is enabled, you can enter the appropriate value in the **Maximum Number of Data Files** field.

Note:

Only the associated case files are retained when using this option.

Maximum Number of Data Files

specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, Ansys Fluent will overwrite the earliest existing file. The default value for this field is zero, which saves all the files.

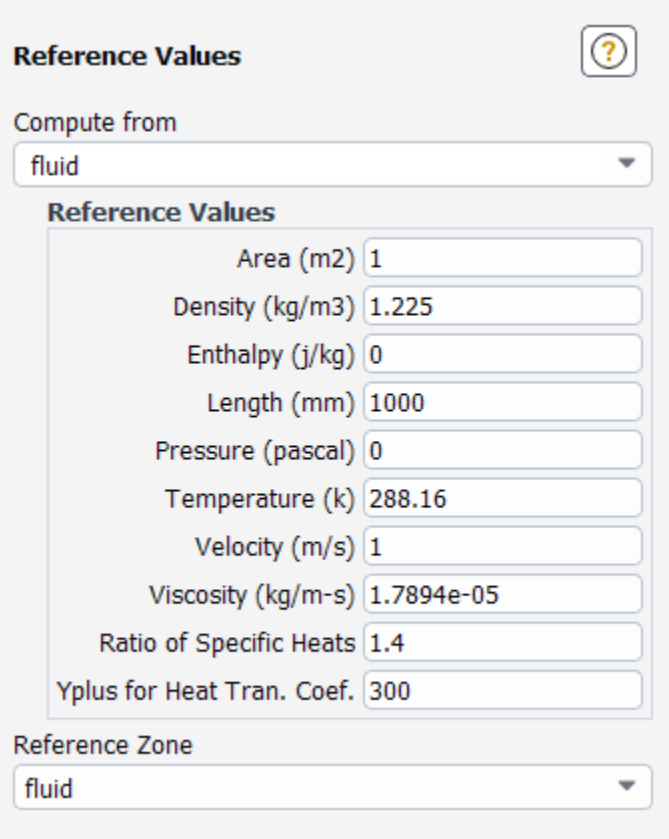
Append File Name with

allows you to select **flow-time** or **time-step** to be appended to the file name. This option is available only for unsteady-state calculations. The default selection is **flow-time**.

50.10. Reference Values Task Page

The **Reference Values** task page allows you to set the reference quantities used for computing normalized flow field variables. It also allows you to specify the reference zone for postprocessing relative velocities in moving-zone problems. See Reference Values (p. 4124) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Compute from

contains a drop-down list of the boundary zones. You may select a zone to be used for automatically defining the reference values, but depending on the boundary condition used, all of the reference values may not be set. For example, the reference length and area will not be set by computing the reference values from a boundary condition; you must set these manually.

Reference Values

contains inputs for the reference values.

Area

sets the reference area, which is used to compute the force and moment coefficients.

Depth

sets the reference depth used for computing cell volumes in 2D.

Density

sets the reference density, which is used to compute the reference dynamic pressure.

Enthalpy

sets the reference enthalpy, which is used to determine the total enthalpy change.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Length

sets the reference length, which is used in the computation of the moment coefficient.

Pressure

sets the reference pressure, which is used to compute the pressure-related forces and moments and the pressure coefficient.

Temperature

sets the reference temperature, which is used to compute entropy for incompressible flows.

Velocity

sets the reference velocity magnitude, which is used to compute the reference dynamic pressure.

Viscosity

sets the reference kinematic viscosity, which is used in the computation of the boundary Reynolds number.

Ratio of Specific Heats

sets the value of the specific heat ratio, which is used in turbomachinery efficiency calculations.

Yplus for Heat Tran. Coef.

sets the heat transfer coefficient based on the temperature of the fluid at a specified Yplus.

Reference Zone

contains a drop-down list of all cell zones in the domain. For flows involving multiple moving zones, you must select the reference zone for postprocessing relative velocities and related quantities. See Setting the Reference Zone (p. 4127) for details.

50.11. Solution Task Page

The **Solution** task page introduces you to the main tasks involved in solving your CFD simulation using Ansys Fluent. For more information about using Ansys Fluent to solve your CFD simulation, see Using the Solver (p. 3557).

Solution

The task pages accessed under Solution allow you to perform solution setup and calculation tasks. The Solving tab in the tabbed UI above provides access the same pages.

Note that solution adaption is available in the Setting Up Domain->Adapt tab above, and creation of surfaces for monitoring during the calculation is available in the Setting Up Domain->Surface tab above.

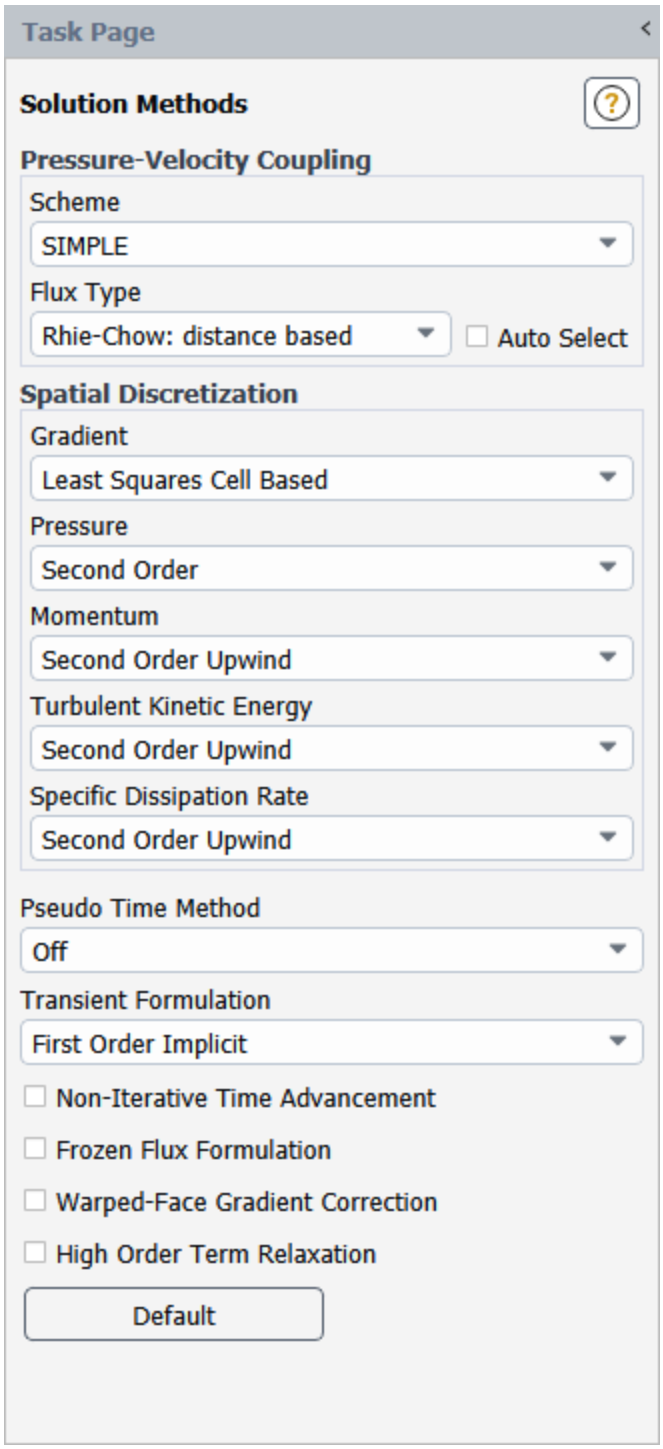
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.12. Solution Methods Task Page

The **Solution Methods** task page allows you to specify various parameters associated with the solution method to be used in the calculation.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Formulation

provides a drop-down list of the available types of solver formulations: **Implicit** and **Explicit**.

This item appears only when the density-based solver is used.

Flux Type

(for the density-based solver) provides a drop-down list of the convective flux types: **Roe-FDS**, **AUSM**, and **Low Diffusion Roe-FDS**. Details about each of the flux types can be found in Convective Fluxes in the Theory Guide.

Pressure-Velocity Coupling

contains settings for pressure-velocity coupling schemes.

Scheme

(for the pressure-based solver only) provides a drop-down list of the available pressure-velocity coupling schemes: **SIMPLE**, **SIMPLEC**, **PISO**, and **Coupled**. When the non-iterative time advancement (NITA) scheme is enabled in the **Solution Methods** task page, **Fractional Step** is available for single phase flows, and **Phase Coupled SIMPLE** is available for Eulerian multiphase flows. See Pressure-Velocity Coupling in the *Fluent Theory Guide*, and Choosing the Pressure-Velocity Coupling Method (p. 3571), Setting Solution Controls for the Non-Iterative Solver (p. 3578), and Selecting the Pressure-Velocity Coupling Method (p. 3180) for details about these methods.

Skewness Correction

enables the SIMPLEC and PISO skewness correction for highly skewed meshes if the value (number of iterations) is greater than 0. The default value is 0 for SIMPLEC and 1 for PISO.

Neighbor Correction

enables the PISO neighbor correction, which is recommended for transient calculations, if the value (number of iterations) is greater than 0. The default value is 1.

Skewness-Neighbor Coupling

allows for a more economical but a less robust variation of the PISO algorithm.

Coupled with Volume Fraction

couples velocity corrections, shared pressure corrections, and the correction for volume fraction simultaneously. This option is available in the interface after you have selected **Coupled** from the **Scheme** drop-down list for **Pressure-Velocity Coupling**.

Solve N-Phase Volume Fraction Equations

solves all primary and secondary volume fraction equations and scales the resulting volume fractions to satisfy the requirement that they sum to 1. If this is disabled, only the secondary phase volume fractions are solved directly and the primary phase volume fraction is set such that the volume fractions sum to 1.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Flux Type

(for the pressure-based solver) provides a drop-down list of the mass flux types: **Rhie-Chow: distance based** and **Rhie-Chow: momentum based**. Details about each of the flux types can be found in Discretization of the Continuity Equation in the Theory Guide. You cannot change the selection if **Auto Select** is enabled. For multiphase models other than the wet steam model, this list is not available and the **Rhie-Chow: momentum based** flux option is used.

Auto Select

enables the automatic selection of the **Flux Type**, so that the most robust formulation is used for the flow models and mesh attributes of your case (for details, see Mass Flux Types (p. 3574)). This option is enabled by default.

Spatial Discretization

contains settings that control the spatial discretization of the convection terms in the solution equations. See Choosing the Spatial Discretization Scheme (p. 3561) for details.

Gradient

contains a drop-down list of the options for setting the method of computing the gradient in Equation 24.30 in the Theory Guide: **Green-Gauss Cell Based**; **Green-Gauss Node-Based**, and **Least Squares Cell Based**. See Evaluation of Gradients and Derivatives in the Theory Guide for details.

Pressure

(for the pressure-based solver only) contains a drop-down list of the discretization schemes available for the pressure equation: **Standard**, **PRESTO!**, **Linear**, **Second Order**, **Body Force Weighted**, and **Modified Body Force Weighted**.

This item appears only when the pressure-based solver is used.

Flow

(for the density-based solvers only) contains a drop-down list of the discretization schemes available for the pressure, momentum, and (if relevant) energy equations: **First Order Upwind**, **Second Order Upwind**, **Third-Order MUSCL**, and (if the LES, DES, SAS, SDES, or SBES turbulence model is enabled) **Bounded Central Differencing**.

This item appears only when one of the density-based solvers is used.

Momentum, Energy, and so on

are the names of the other convection-diffusion equations being solved. In the drop-down list next to each equation, you can select the **First Order Upwind**, **Second Order Upwind**, **QUICK**, or **Third-Order MUSCL** discretization scheme for that equation.

If the LES, DES, SAS, SDES, or SBES turbulence model is enabled, then you have a choice of selecting **Bounded Central Differencing** or **Central Differencing** for **Momentum**. If **Bounded Central Differencing** is selected, an entry field **BCD Scheme Boundedness** appears under the **Spatial Discretization** group box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If one of the density-based solvers is used, **Momentum** and **Energy** will not appear. For the density-based solvers, the discretization scheme for these equations is selected in the **Flow** drop-down list (described above).

BCD Scheme Boundedness

specifies the boundedness strength of the BCD scheme as a constant or an expression. In the latter case, the field variable **BCD Scheme Boundedness** is created in the **Derivatives** category and can be visualized.

Volume Fraction

is available when the VOF multiphase model is enabled. The discretization schemes that are used when solving volume fraction equations for the VOF explicit scheme are **Geo-Reconstruct**, **Compressive**, **CICSAM**, **Modified HRIC**, and **QUICK**. The discretization schemes that are used when solving volume fraction equations for the VOF implicit scheme are **First Order Upwind**, **Second Order Upwind**, **Compressive**, **Modified HRIC**, **BGM** (steady state only), and **QUICK**. See Interpolation Near the Interface in the Theory Guide for detailed information about these VOF-specific interpolation schemes.

Pseudo Time Method

allows you to select a form of implicit under-relaxation (see Pseudo Time Method Under-Relaxation): the **Local Time Step** or **Global Time Step** method. This list is available for all calculations when using a pressure-based segregated solver (**Local Time Step**) or for steady-state calculations when using the pressure-based coupled solver or the density-based implicit solver (**Global Time Step**). For details on completing the setup for the pseudo time method, see Performing Calculations with a Pseudo Time Method (p. 3659).

Transient Formulation

contains options for setting different time-dependent solution formulations. This option appears only when **Transient** is enabled under **Time** in the **General** task page. Available options include: **Explicit** (available only for the **Density Based Explicit** solver); **First Order Implicit**; **Second Order Implicit**; and **Bounded Second Order Implicit**. See Performing Time-Dependent Calculations (p. 3629) for details.

Non-Iterative Time Advancement

enables non-iterative time-advancement (NITA) scheme. See Time-Advancement Algorithm in the Theory Guide for details.

Options... (NITA)

Opens the **NITA Options** dialog box where you can enable the **Hybrid Nita** option and adjust the relevant controls. See Hybrid NITA for the VOF and Mixture Multiphase Models (p. 3581) for a description of the available controls. This item is available only for the VOF and Mixture multiphase models when the **Non-Iterative Time Advancement** option is enabled.

Accelerated Time Marching

enables a modified NITA scheme and other setting changes that can speed up the simulation. This option is only available with the Large Eddy Simulation (LES) turbulence model, and is intended for

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

unreacting flow simulations that use a constant-density fluid. For details, see Setting Solution Controls for the Non-Iterative Solver (p. 3578).

Frozen Flux Formulation

enables an option to discretize the convective part of Equation 24.68 in the Theory Guide using the mass flux at the cell faces from the previous time level n. This option is available only for a **Transient** solution. See The Frozen Flux Formulation in the Theory Guide for details.

Warped-Face Gradient Correction

enables an adjustment to the gradient discretization method that improves the gradient accuracy for meshes containing high aspect ratios, cells with non-flat faces, and highly deformed cells, and can help avoid numerical difficulties in simulations that involve a mesh that has large differences in the volumes of neighboring cells. By default, the fast, or more computationally efficient mode of the warped-face gradient correction is used. For additional information about the warped-face gradient correction, see Warped-Face Gradient Correction (p. 3731).

Convergence Acceleration For Stretched Meshes

enable convergence acceleration for stretched meshes to improve the convergence of the implicit density based solver on meshes with high cell stretching (see Convergence Acceleration for Stretched Meshes (CASM) (p. 3591)).

High-Speed Numerics

enables built-in, customized numeric settings that can help to stabilize and accelerate the convergence for high-speed flows. (see Enabling High-Speed Numerics (p. 3594)).

High Order Term Relaxation

enables the relaxation of high order terms to aid in the solution behavior of flow simulations when higher order spatial discretization is used.

Options...

opens the Relaxation Options Dialog Box (p. 5108).

Turbomachinery-Specific Numerics

enables built-in customized numerics settings that can help to achieve and accelerate the convergence for turbomachinery flows. This option is only available when the **Turbo Models** option is enabled in the **Domain** ribbon tab (**Turbomachinery** group) for a steady calculation with the pressure-based solver selected and the **Pseudo Time Method** set to the **Global Time Step** option. For further details, see Turbomachinery-Specific Numerics (p. 1995).

Set All Species Discretizations Together

enables an option to use the same discretization scheme for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a **Species** field will appear with the scheme of your choice. Note that this option is available when species transport is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Default

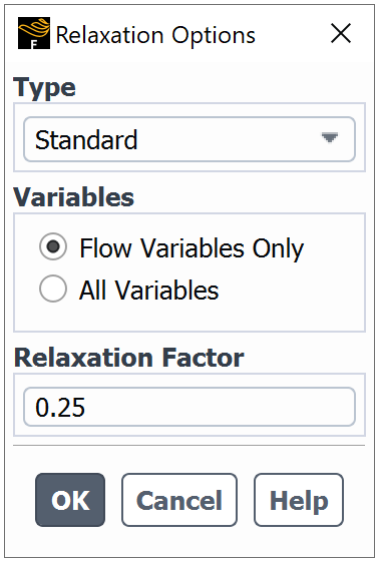
sets the fields to their default values, as assigned by Ansys Fluent.

Report Poor Quality Elements

reports statistics on the number and type of cells that Ansys Fluent has identified as having poor quality.

50.12.1. Relaxation Options Dialog Box

The **Relaxation Options** dialog box allows you to further control the **High Order Term Relaxation** (HOTR), as described in High Order Term Relaxation (HOTR) (p. 3564).



Controls

Type

allows you to select between **Standard** (which is the default selection and applies HOTR to both convection and diffusion terms) or **Convection Only** (which applies HOTR exclusively to the convection terms). The **Type** list is only available with the pressure-based solver.

Variables

allows you to select between under-relaxing **All Variables** or only the default flow variables (**Flow Variables Only**.

Relaxation Factor

is by default 0.25 for steady-state cases and 0.75 for transient cases.

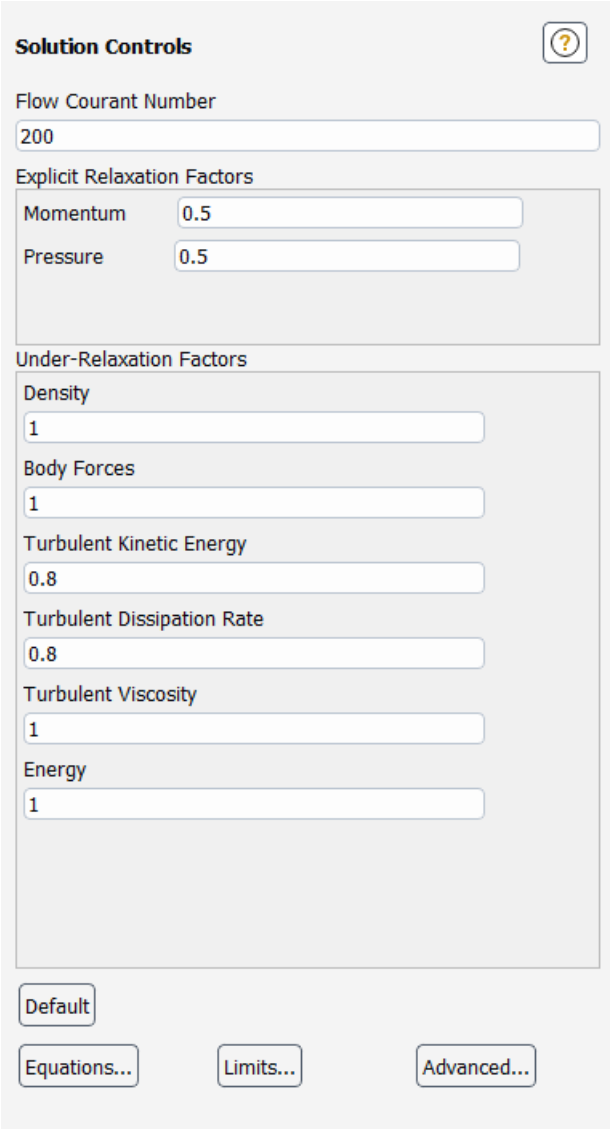
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.13. Solution Controls Task Page

The **Solution Controls** task page allows you to set common solution parameters.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.



Controls

Courant Number

sets the fine-grid Courant number (time step factor) when the density-based solver is used. See Changing the Courant Number (p. 3588) for guidelines on setting the Courant number.

When the pressure-based solver is used for time-independent flows, and the **Coupled** pressure-velocity scheme is used, the **Courant Number** is used to stabilize the convergence behavior. See Under-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Relaxation of Equations in the Theory Guide for a correlation of the under-relaxation factor and courant number.

Flow Courant Number

sets the Courant number for multiphase flow using the pressure-based coupled solver. The **Flow Courant Number** is used to stabilize the convergence behavior.

Volume Fraction Courant Number

sets the Courant number for multiphase flow using the pressure-based solver is coupled with the volume fraction. The default value is 200 and will appear in the interface when the **Coupled with Volume Fraction** option appears in the **Solution Methods** task page.

Pseudo Time Courant Number

sets the pseudo time Courant number when a **Pseudo Time Method** is selected with a pressure-based segregated solver (see Local Time Step Method Setting (p. 3661)).

Explicit Relaxation Factors

for the **Coupled** scheme defines the explicit relaxation of variables between sub-iterations for momentum and pressure. See Under-Relaxation of Variables in the Theory Guide for information.

Multigrid Levels

specifies the maximum number of coarse levels to be created by the FAS multigrid solver. This item is the same as the **Max Coarse Levels** under **FAS Multigrid Controls** in the **Multigrid** tab of the Advanced Solution Controls Dialog Box (p. 5114), and it appears only when the density-based explicit solver is used.

Residual Smoothing

contains parameters that govern the use of implicit residual smoothing. (See Implicit Residual Smoothing in the Theory Guide and Using Residual Smoothing to Increase the Courant Number (p. 3596) for details.) This section of the task page will appear only when the density-based explicit solver is used.

Iterations

sets the number of iterations of the Jacobi smoother to use. If **Iterations** is 0, then no implicit residual smoothing is performed.

Smoothing Factor

sets the implicit residual smoothing factor. This item will not appear unless **Iterations** is set to a non-zero value.

Under-Relaxation Factors

contains the under-relaxation factors for all equations that are being solved with the pressure-based solver. (See Setting Under-Relaxation Factors (p. 3575) for details.) In the field next to each equation, you can set the under-relaxation factor for that equation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When one of the density-based solvers is used, **Under-Relaxation Factors** will appear only for the following variables, when they are included in your model: solid (for conjugate heat transfer models), turbulence variables, and viscosity. The solid under-relaxation factor is used to scale the CFL value in the solid region only if the under-relaxation value is set to a value less than 1. When the under-relaxation value is set to 1, then the solver ignores the specified CFL value for the solid and instead uses a very large value of CFL. This is done to speed up the convergence in the solid region. The density-based solvers use a segregated method to solve these equations; all the other equations are solved in a coupled manner, so there are no under-relaxation factors for them.

When **Non-Iterative Time Advancement** is selected for the pressure-based solver, the **Non-Iterative Solver Relaxation Factors** define the explicit relaxation (Under-Relaxation of Variables in the Theory Guide) of variables between sub-iterations and are used to prevent the solution from diverging.

Note the following if a **Pseudo Time Method** is selected: if **Global Time Step** is selected for steady-state cases with the pressure-based coupled solver or the density-based implicit solver, the **Pseudo Time Explicit Relaxation Factors** can be specified (see Global Time Step Method Settings (p. 3662)); if **Local Time Step** is selected for a pressure-based segregated solver, the **Pseudo Time Under-Relaxation Factors** can be specified (see Local Time Step Method Setting (p. 3661)).

Acoustics Wave Equation Solver Controls

contains parameters that govern the acoustics wave equation solver

Relative Convergence Criterion

sets the relative convergence criterion for the acoustics wave equation solver.

Max Iteration/Time Step

sets the maximum number of iterations per time step.

Default

sets the fields to their default values, as assigned by Ansys Fluent.

Equations...

displays the Equations Dialog Box (p. 5112).

Limits...

displays the Solution Limits Dialog Box (p. 5112).

Advanced...

displays the Advanced Solution Controls Dialog Box (p. 5114).

Set All Species URFs Together

enables an option to use the same under-relaxation factors for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a **Species** field will appear with the specified under-relaxation factor. Note that this option is available when species transport is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

For additional information, see the following sections:

50.13.1. Equations Dialog Box

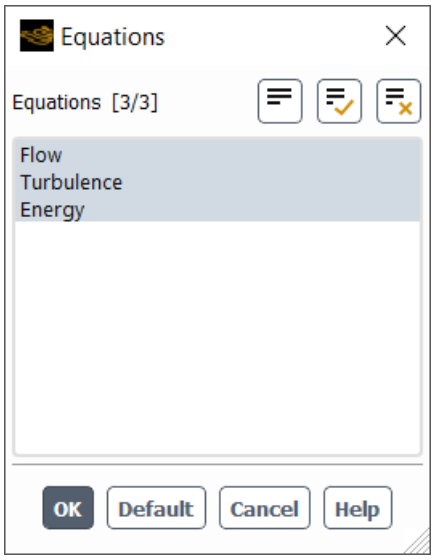
50.13.2. Solution Limits Dialog Box

50.13.3. Advanced Solution Controls Dialog Box

50.13.1. Equations Dialog Box

The **Equations** dialog box contains a list of the equations being solved for the current model. To temporarily disable solution of an equation, deselect it in this list and click **OK**. To re-enable the calculation for an equation, select it and click **OK**. See Step-by-Step Solution Processes (p. 3725) for details about using this feature in a step-by-step solution process.

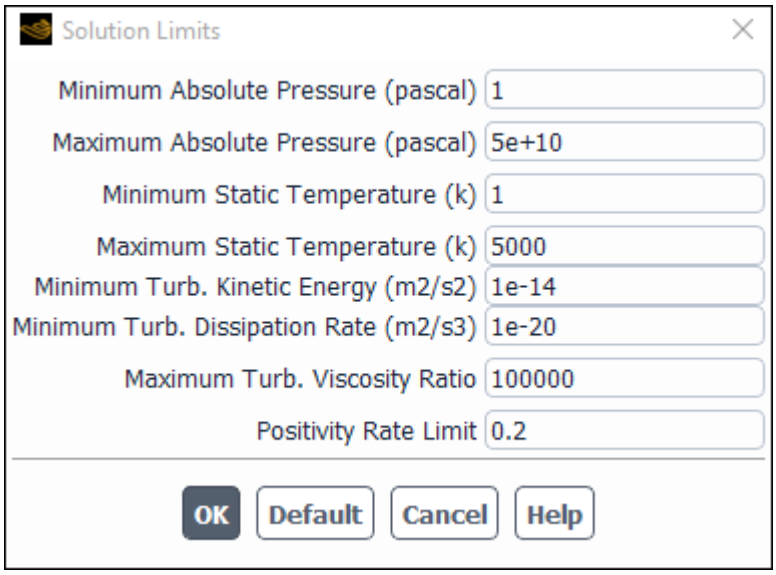
Note that, when one of the density-based solvers is used, **Energy** will not appear as a separate item in the **Equations** list. For the density-based solvers the energy equation is included in the **Flow** category (which also includes the pressure and momentum equations).



50.13.2. Solution Limits Dialog Box

The **Solution Limits** dialog box allows you to improve the stability of the solution. See Setting Solution Limits (p. 3607) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Minimum Absolute Pressure, Maximum Absolute Pressure

set the limiting minimum and maximum allowable values for absolute pressure.

Minimum Static Temperature, Maximum Static Temperature

set the limiting minimum and maximum allowable values for temperature.

Minimum Turb. Kinetic Energy

sets the limiting minimum value of turbulent kinetic energy (k) in the flow field. This parameter appears when one of the k- ε or k- ω models or the RSM is used.

Minimum Turb. Dissipation Rate

sets the limiting minimum value of turbulent dissipation rate (ε) in the flow field. This parameter appears when one of the k- ε models or the RSM is used.

Minimum Spec. Dissipation Rate

sets the limiting minimum value of specific dissipation rate (ω) in the flow field. This parameter appears when one of the k- ω models is used.

Maximum Turb. Viscosity Ratio

sets the limiting maximum allowable value of the ratio of turbulent to laminar viscosity (μ_t / μ). The turbulent viscosity is reduced to the necessary value so as not to exceed the maximum allowable viscosity ratio.

This parameter appears for all turbulent flows.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Minimum Vol. Frac. for Matrix Solution

sets the limiting minimum value for volume fraction in the matrix solution. This field appears for Eulerian multiphase simulations run on a double-precision solver.

Positivity Rate Limit

sets the limiting value for the rate of reduction of temperature. See Adjusting the Positivity Rate Limit (p. 3609) for details.

This item appears only when one of the density-based solvers is used.

Default

sets the fields to their default values, as assigned by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

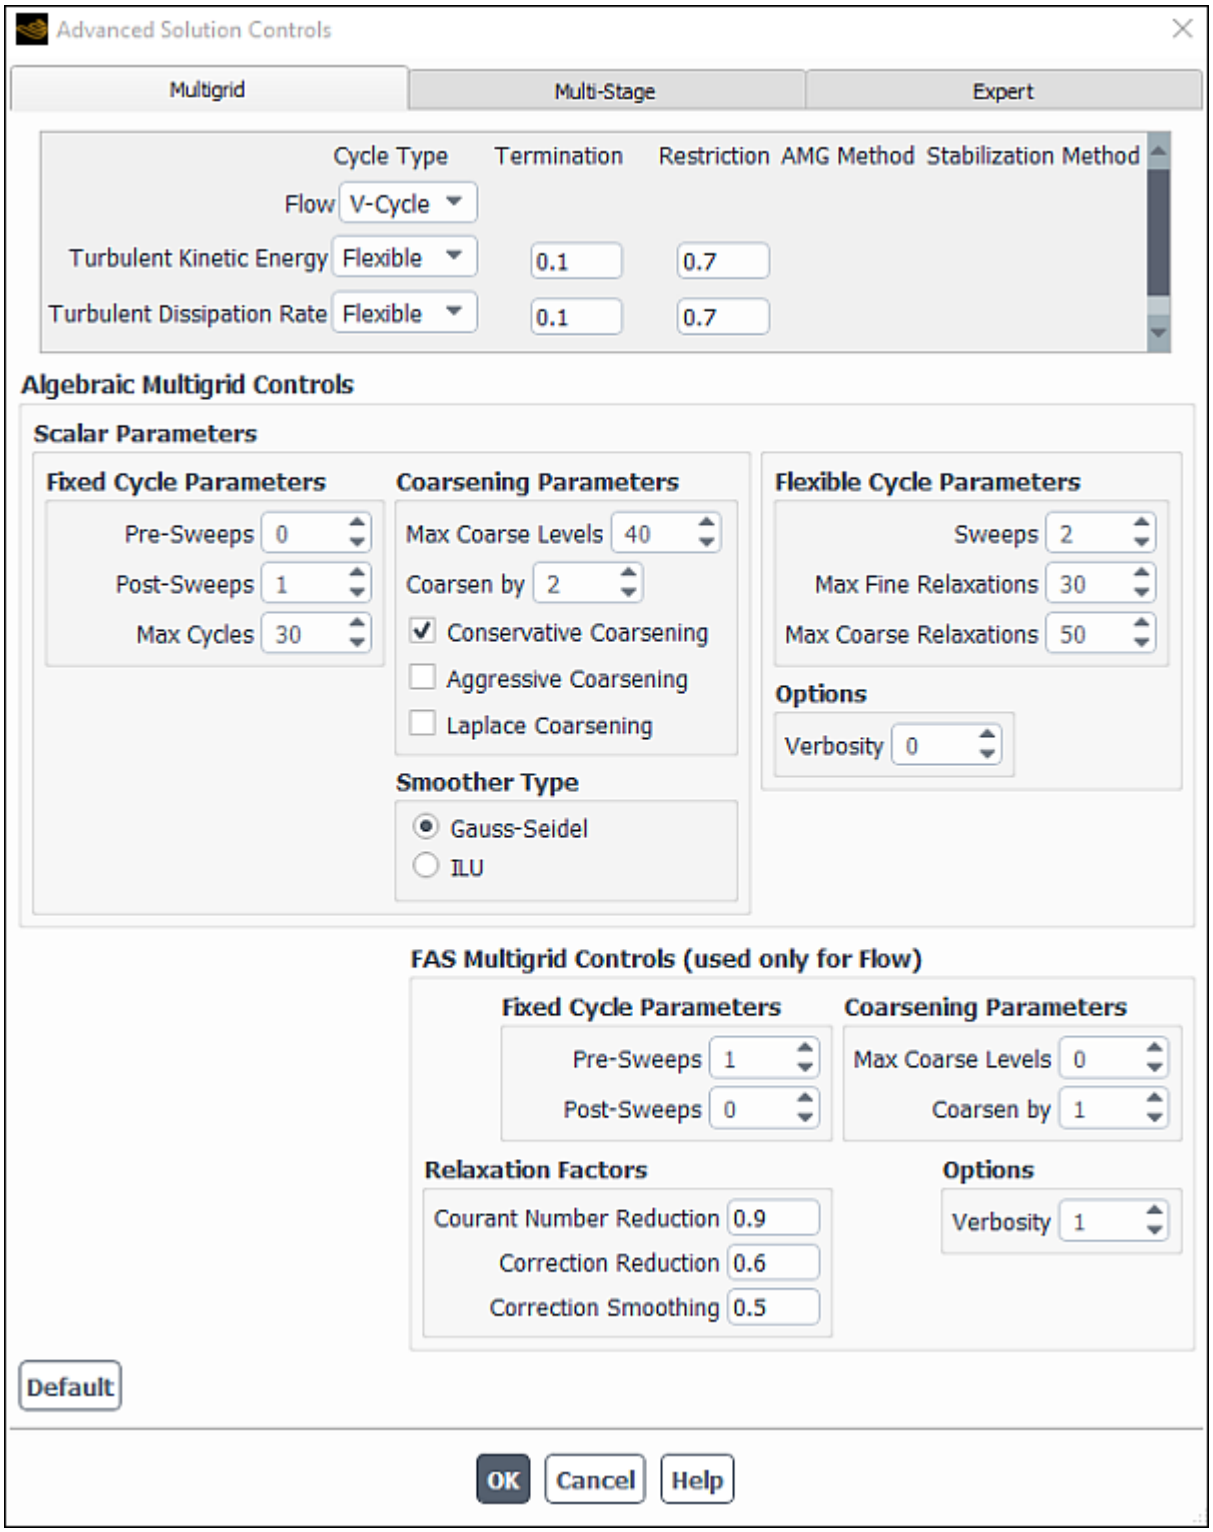
Reset

resets the fields to their most recently saved values (for example, the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

50.13.3. Advanced Solution Controls Dialog Box

The **Advanced Solution Controls** dialog box allows you to set parameters related to the multigrid, multi-stage, and non-iterative solvers.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Multigrid

tab contains parameters related to the multigrid solver. See Modifying Algebraic Multigrid Parameters (p. 3727) and Setting FAS Multigrid Parameters (p. 3604) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cycle Type

contains a drop-down list for each equation that is being solved. From this list you can select the multigrid cycle type (**Flexible**, **V-Cycle**, **W-Cycle**, or **F-Cycle**). See Specifying the Multigrid Cycle Type (p. 3599) for details.

Note that, for the density-based solvers, the **Pressure**, **Momentum**, and **Energy** equations will not appear individually. They will instead be grouped together and called **Flow**.

Furthermore, for the density-based explicit solver, the **Cycle Type** choices for the **Flow** equations will be limited to **V-Cycle** and **W-Cycle**, while the choices for **Flow** for the density-based implicit solver will be limited to **V-Cycle** and **F-Cycle**.

Termination

specifies the termination criterion for each equation that is being solved using algebraic multigrid. See Setting the Termination and Residual Reduction Parameters (p. 3599) for details.

Restriction

specifies the residual reduction criterion for each equation that is being solved using the **Flexible** algebraic multigrid cycle. See Setting the Termination and Residual Reduction Parameters (p. 3599) for details. (This item will not appear for an equation that is using a **V-Cycle**, **W-Cycle**, or **F-Cycle**.)

Stabilization Method

contains the drop-down list to choose the stabilization method. For further details, see Setting the Stabilization Method (p. 3599).

BCGSTAB

enables the bi-conjugate gradient stabilized method.

RPM

enables the recursive projection method. RPM stabilization is mainly used in conjunction with the coupled pressure-based solver.

CG

enables the conjugate gradient method. CG stabilization is mainly used in conjunction with the segregated pressure-based solver.

GMRES

enables the generalized minimal residual method. GMRES stabilization is recommended for cases that fail to converge with the BCGSTAB method.

Algebraic Multigrid Controls

contains parameters related to the algebraic multigrid solver. See Algebraic Multigrid (AMG) in the Theory Guide and Modifying Algebraic Multigrid Parameters (p. 3727) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scalar and Coupled Parameters

contain parameters that you can set, If you are using the density-based explicit solver or the pressure-based solver with any of the segregated schemes, described in Pressure-Velocity Coupling in the Theory Guide and Choosing the Pressure-Velocity Coupling Method (p. 3571), you will only set **Scalar Parameters**. If you are using the density-based implicit or the pressure-based coupled scheme, described in Coupled Algorithm, then you can set the **Coupled Parameters**.

Fixed Cycle Parameters

contains parameters that control the V, W, and F cycles. You can set the number of **Pre-Sweeps** and **Post-Sweeps**, and the **Max Cycles**. Normally one post-sweep is performed and no pre-sweeps are done. See Fixed Cycle Parameters (p. 3601) for details about using the items below.

Pre-Sweeps

sets the number of sweeps to perform before moving to a coarser level.

Post-Sweeps

sets the number of sweeps to perform after coarser level corrections have been applied.

Max Cycles

sets the maximum number of V, W, or F cycles to be performed. The multigrid solver will continue to solve the set of equations until either the maximum number of cycles has been performed, or the **Termination** criteria are satisfied.

Coarsening Parameters

contains parameters that control the grouping of equations in the algebraic multigrid algorithm. See Coarsening Parameters (p. 3601) for details

Max Coarse Levels

is the maximum number of coarse levels that will be built by the multigrid solver. Sets of coarser simultaneous equations are built until the maximum number of levels has been created, or the coarsest level has only 3 equations. Each level has about half as many unknowns as the previous level, so coarsening until there are only a few nodes left will require about as much total coarse-level coefficient storage as was required on the fine mesh. Reducing the maximum coarse levels will reduce the memory requirements, but may require more iterations to achieve a converged solution. Setting **Max Coarse Levels** to 0 turns off the multigrid solver.

Coarsen by

controls the number of equations on each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of equations on each level will be 1/2 of the number on the previous level. In general, the number of equations

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

on each coarser grid level will be approximately equal to 1/ n of the number on the previous level, where n is the value set for the **Coarsen by** parameter.

Conservative Coarsening

enables the use of conservative coarsening techniques that can improve parallel performance and/or convergence for some difficult cases.

Aggressive Coarsening

specifies the use of a version of the AMG solver that is optimized for high coarsening rates. It is recommended if the AMG solver diverges with the default settings.

Laplace Coarsening

enables the use of Laplace coefficients when grouping cells for coarsening.

Smoother Type

consist of two types:

Gauss-Seidel

is the simplest smoother type and is recommended when using the pressure-based segregated solver.

ILU

is more CPU intensive, but has better smoothing properties for block-coupled systems such as the pressure-based coupled solver and the density-based implicit solver.

Flexible Cycle Parameters

contains parameters that control the flexible multigrid cycle.

Sweeps

specifies the number of times to apply the smoothing method each time a relaxation is performed.

Max Fine Relaxations

sets the maximum number of relaxations to be performed on the Level 1 grid (fine grid level). This parameter eliminates the possibility that the Gauss-Seidel solver will get "stuck" on the fine grid level, unable to reduce the residuals by the fraction (α) required by the **Termination** criteria.

Max Coarse Relaxations

sets the maximum number of relaxations to be performed on each grid level above Level 1 (that is, the coarse grid levels). This parameter eliminates the possibility that the Gauss-Seidel solver will get "stuck" on a coarse grid level, unable to reduce the residuals on that level by the fraction (α) required by the **Termination** criteria. If the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

iterative solution on a given grid level is unable to meet the accuracy constraint of the **Termination** criteria, the correction equation will be deemed "converged" when this maximum number of relaxations on that grid level has been performed.

Options

contains additional multigrid parameters.

Verbosity

controls the amount of information that is printed out by the multigrid solver for monitoring purposes. See Setting the Verbosity (p. 3603) for details

FAS Multigrid Controls

contains parameters related to the FAS multigrid solver. See Full-Approximation Storage (FAS) Multigrid in the Theory Guide and Setting FAS Multigrid Parameters (p. 3604) for details. As noted in the title of this dialog box section, the FAS multigrid solver is used only for the **Flow** equations (pressure, momentum, and energy).

This section of the dialog box appears only when the density-based explicit solver is used.

Fixed Cycle Parameters

contains parameters that control the V, W, and F cycles of the FAS multigrid solver.

Pre-Sweeps

sets the number of iterations of the multi-stage solver to be performed on a given grid level before proceeding to a coarser grid level (the value of β_1 described in Multigrid Cycles in the Theory Guide). Typically, this is set to 1.

Post-Sweeps

sets the number of multigrid cycles to be performed on a given grid level before proceeding back up to the finer grid level (the value of β_2 described in Multigrid Cycles in the Theory Guide). A value of 1 results in V-cycle multigrid, and a value of 2 results in W-cycle multigrid.

Coarsening Parameters

contains parameters that control the grouping of cells in the FAS multigrid algorithm.

Max Coarse Levels

sets the maximum number of grid levels to be used in the multigrid process. A value of 0 disables multigrid (no coarse grid levels). If the coarse grids do not already exist, they are created automatically when you start iterating; you cannot create them by clicking the **OK** button. See Turning On FAS Multigrid (p. 3595) for details.

Coarsen by

controls the number of cells in each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of cells on each level will be 1/2 of

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

the number on the previous level. In general, the number of cells on each coarser grid level will be equal to 1/ n of the number on the previous level, where n is the value set for the **Coarsen by** parameter.

Relaxation Factors

are provided to moderate and stabilize the multigrid corrections.

Courant Number Reduction

sets the factor by which to reduce the Courant number for coarse grid levels (that is, every level except the finest). Some reduction of time step (such as the default 0.9) is typically required because the stability limit cannot be determined as precisely on the irregularly shaped coarser grid cells.

Correction Reduction

sets the factor by which to reduce the magnitude of the multigrid corrections transferred from one level to the next finer level. A typical value with $\beta_1 = 1$ is 0.6. If two **Pre-Sweeps** and two **Post-Sweeps** are performed, this value can often be increased to 1.0 (that is, full correction transfer).

Species Correction Reduction

sets the factor by which to reduce the magnitude of the species corrections to stabilize the multigrid calculation. This item appears only when species transport is being modeled.

Correction Smoothing

sets the correction smoothing factor used to interpolate corrections from a coarser grid to a finer grid. For multigrid on structured meshes, corrections can be interpolated up to a finer mesh "smoothly" by using, for example, tri-linear interpolation. For unstructured meshes there is no analogous simple, algebraic procedure that can be used to interpolate without introducing substantial high frequency "noise". Instead, the corrections are first interpolated, and then subjected to a smoothing pass. The default **Correction Smoothing** value of 0.5 should be acceptable for all cases; you should not need to change it.

Options

contains additional multigrid parameters.

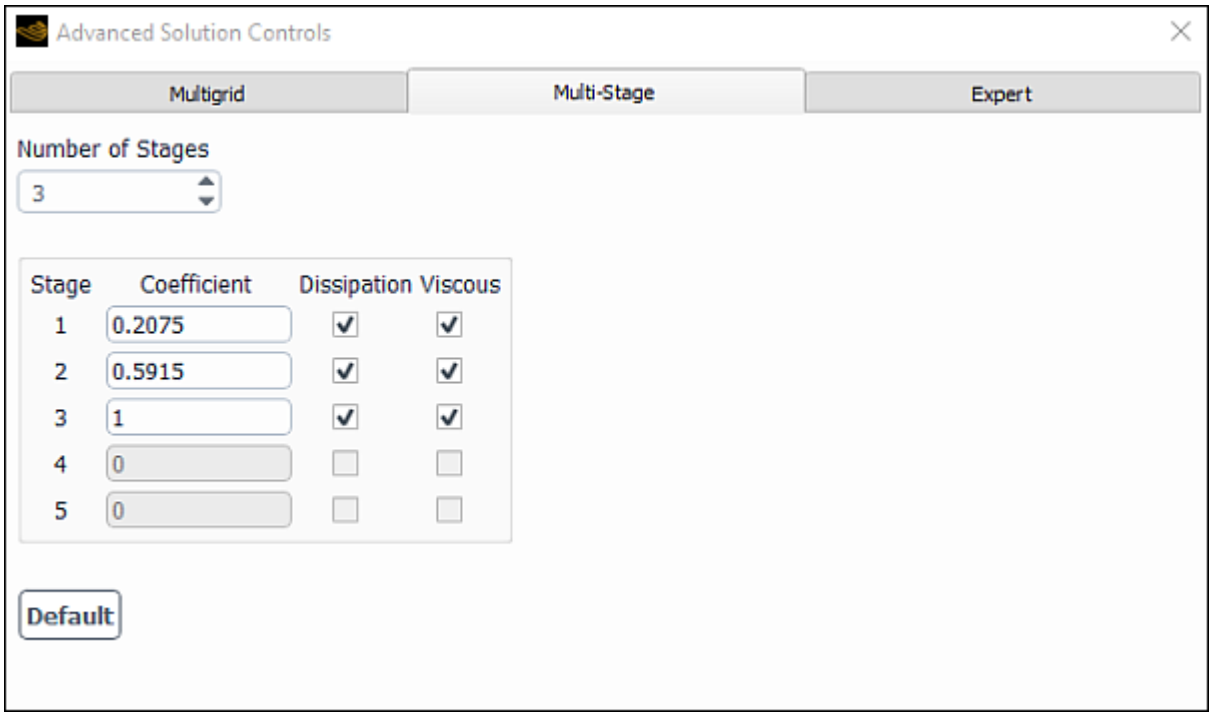
Verbosity

controls the amount of information that is printed out by the multigrid solver for monitoring purposes.

Multi-Stage

tab allows you to set parameters that govern the operation of the multi-stage solver. It is available only when the density-based explicit solver is used. See Changing the Multi-Stage Scheme (p. 3610) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Number of Stages

is the number of stages used in the multi-stage scheme. The default scheme is a 3-stage scheme with coefficients of 0.2075, 0.5915, and 1.0 for the first through third stages, respectively. Although the dialog box limits the maximum number of stages to five, you can define a scheme with an arbitrary number of stages with the `solve/set/multi-stage` text command.

Stage

labels the stage to which the parameters in the other columns apply.

Coefficient

sets the multi-stage coefficient for each stage. Coefficients should be greater than zero and less than one. The final stage should always have a coefficient of 1.

Dissipation

sets the stages for which artificial dissipation is evaluated. If a **Dissipation** box is selected for a particular stage, artificial dissipation will be updated on that stage. If not selected, artificial dissipation will remain "frozen" at the value of the previous stage.

Viscous

sets the stages for which viscous stresses are evaluated. If a **Viscous** box is selected for a particular stage, viscous stresses will be updated on that stage. If not selected, viscous stresses will remain "frozen" at the value of the previous stage. Viscous stresses should always be computed on the first stage, and successive evaluations will increase the "robustness" of the solution process, but will also increase the expense (that is, increase the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CPU time per iteration). For steady problems, the final solution is independent of the stages on which viscous stresses are updated.

Default

sets the fields to their default values, as assigned by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

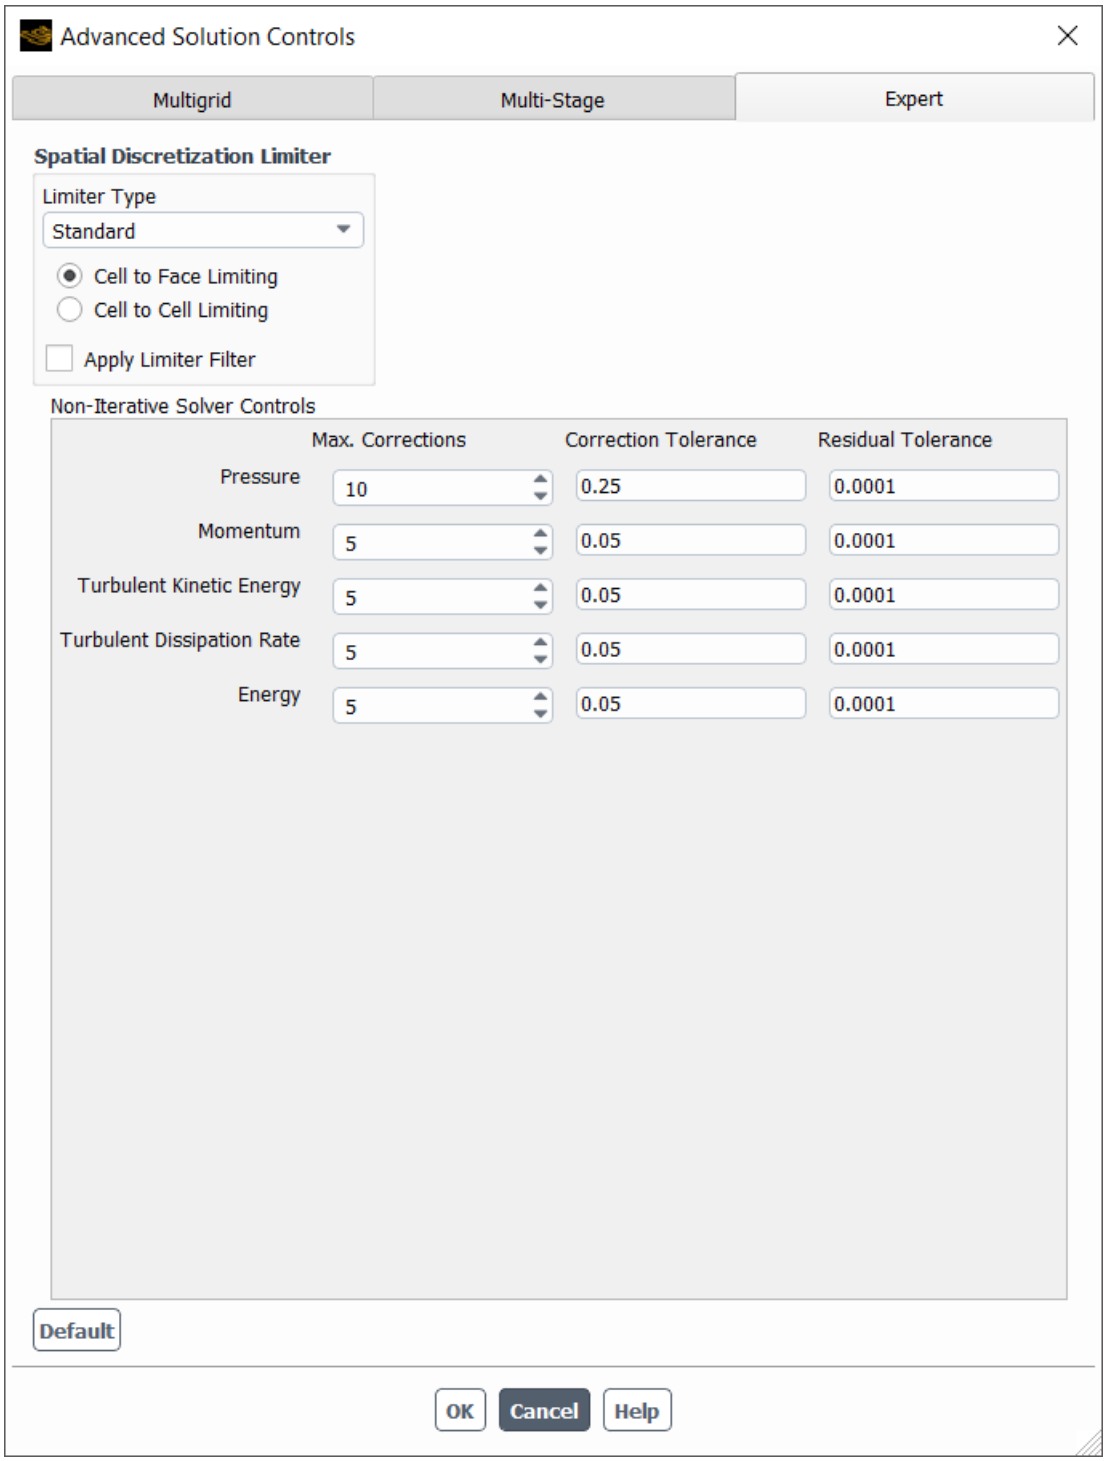
Reset

resets the fields to their most recently saved values (that is, the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

Expert

tab contains specialized parameters for limiting spatial discretization, as well as controls for the non-iterative solver.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Spatial Discretization Limiter

contains controls for limiting the spatial discretization. See Selecting Gradient Limiters (p. 3612) for more information about limiters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Limiter Type

selects the type of limiter applied to the spatial discretization: **Standard**, **Multidimensional**, or **Differentiable**.

Cell to Face Limiting

is where the limited value of the reconstruction gradient is determined at the cell face centers. This is the default method.

Cell to Cell Limiting

is where the limited value of the reconstruction gradient is determined along a scaled line between two adjacent cell centroids. On an orthogonal mesh (or when the cell-to-cell direction is parallel to face area direction), this method becomes equivalent to the default cell to face method. For smooth field variation, cell to cell limiting may provide less numerical dissipation on meshes with skewed cells.

Apply Limiter Filter

enables the limiter filter. The limiter filter is only available with the **Standard** and **Differentiable** limiter types.

Pseudo Time Method Usage

allows you to select and modify the parameters for each individual equation. See Advanced Solution Controls for the Pseudo Time Method (p. 3665) for details.

On/Off

enables/disables the equation-specific steady-state solution method for a particular equation.

Under-Relaxation Factor

allows you to use the standard steady-state method by turning off the pseudo time method for that particular equation. Specify the corresponding under-relaxation factor to be employed with a particular equation.

Time Scale Factor

allows you to specify a factor that scales the pseudo time step size employed for the flow equations specified in the **Run Calculation** task page. A time scale factor other than 1.0 (default) allows the use of an equation specific time step size in lieu of using a uniform global pseudo time step size.

Non-Iterative Solver Controls

contain parameters that control the sub-iterations for the individual equations. See Time-Advancement Algorithm in the Theory Guide for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Max. Corrections

provide control over the maximum number of sub-iterations for each individual equation.

Correction Tolerance

defines the overall accuracy.

Residual Tolerance

controls the solution of the linear equations.

Default

sets the fields to their default values, as assigned by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

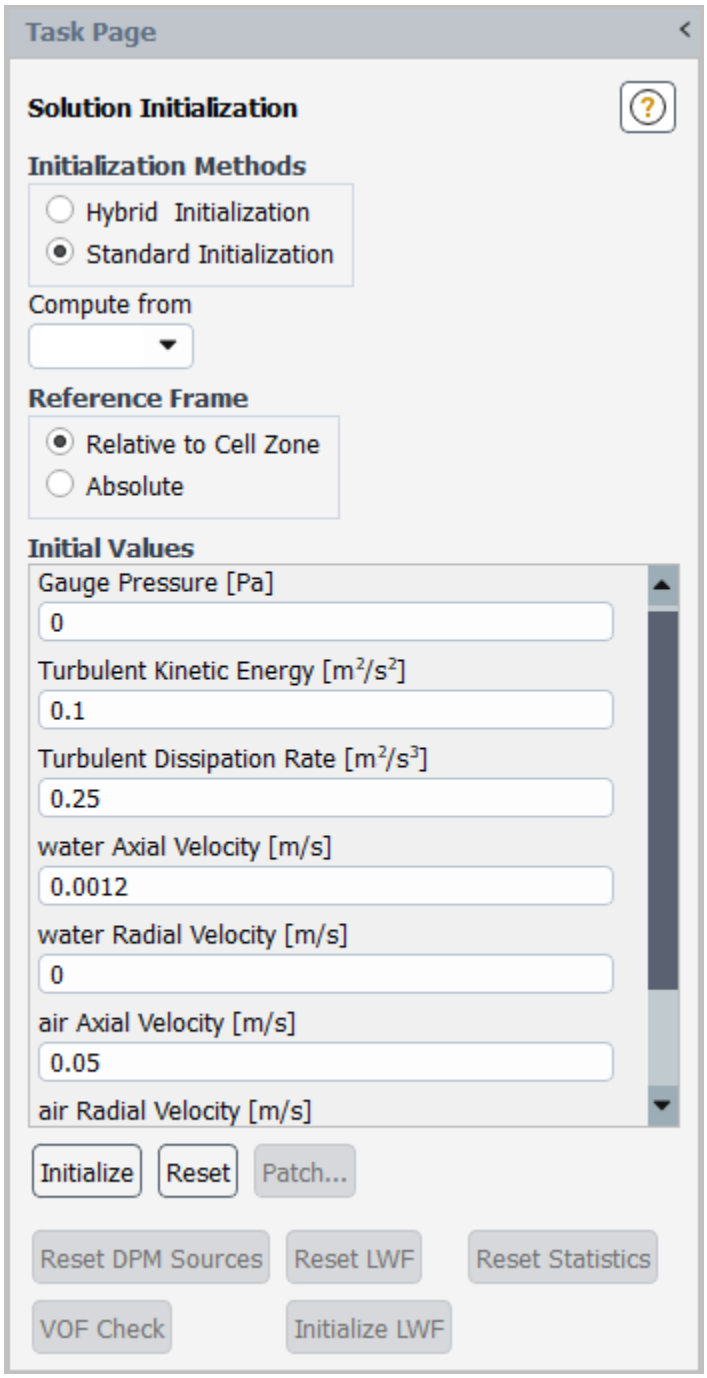
Reset

resets the fields to their most recently saved values (that is, the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

50.14. Solution Initialization Task Page

The **Solution Initialization** task page allows you to define values for flow variables and initialize the flow field to these values. See for details about using this dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Initialization Method

allows you to choose between **Hybrid Initialization** and **Standard Initialization**.

Hybrid Initialization

is a collection of boundary interpolation methods, where variables, such as temperature, turbulence, species fractions, volume fractions, and so on, are automatically patched based on domain averaged values or a particular interpolation recipe (see Hybrid Initialization (p. 3621)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Standard Initialization

allows you to define values for flow variables and initialize the flow field to these values.

Compute from

is a drop-down list of zones; the default values for applicable variables will be computed from information contained in the zone that you select from this list. The computation will occur when you select the required zone, and the variable values will be displayed in **Initial Values**. You can also choose the **all-zones** item in this list to compute average values based on all zones.

Reference Frame

indicates whether the initial velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Initial Values

displays the initial values of applicable variables. You can use **Compute from** to compute values from a particular zone, or you can enter values directly. For species transport cases with a single phase flow, only the boundary species that you have selected in the **Select Boundary Species** dialog box (see Figure 18.3: The Select Boundary Species Dialog Box (p. 2365)) appear in the list. You can add or remove a species using the **Select Boundary Species** dialog box that can be accessed by clicking **Species** in the **Initialization** task page.

Initialize

initializes the entire flow field to the values listed.

Initialize Acoustics...

opens the Acoustics Initialization Dialog Box (p. 5128).

Reset

resets the fields to their "saved" values.

Patch...

opens the Patch Dialog Box (p. 5129).

FMG...

opens the Full-Multigrid (FMG) Initialization Dialog Box (p. 5131).

Species

opens the **Select Boundary Species** dialog box (see Figure 18.3: The Select Boundary Species Dialog Box (p. 2365)), where you can select the boundary species to be displayed in the **Initial Values** list and in the **Patch**, **Hybrid Initialization**, and relevant boundary conditions dialog boxes. You can modify the selected boundary species list on the fly during the problem setup. This item appears for species transport cases with a single phase flow only.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset DPM Sources

allows you to reset the interphase sources/sinks of momentum, heat, and/or mass to zero. This item is available when you perform coupled discrete phase calculations. See Resetting the Interphase Exchange Terms (p. 2829) for details.

Reset LWF

deletes the Lagrangian wall film (LWF) particles and zeroes out the corresponding face variables without affecting the free stream particles. See Patching the Wall Film (p. 2806) for details. This button is available only with the **wall-film** DPM boundary condition.

Reset Statistics

can be used to both initialize the flow statistics and reset the flow statistics after you have gathered some data for time statistics. This item is available when you perform unsteady calculations and have enabled the **Data Sampling for Time Statistics** option in the Run Calculation Task Page (p. 5153). See Inputs for Time-Dependent Problems (p. 3631) for details.

VOF Check

prints a summary report for the VOF case setup. This button is displayed only for VOF multiphase cases. It becomes available after the case is initialized. For details, see Multiphase Case Check (p. 3202).

Initialize LWF

initializes the Lagrangian wall film (LWF) on all walls with the **wall-film** DPM boundary condition. This button is available only when the LWF model is used.

More Settings...

opens the Hybrid Initialization Dialog Box (p. 5132). This button is available only when **Hybrid Initialization** is the selected method.

For additional information, see the following sections:

50.14.1. Acoustics Initialization Dialog Box

50.14.2. Patch Dialog Box

50.14.3. Full-Multigrid (FMG) Initialization Dialog Box

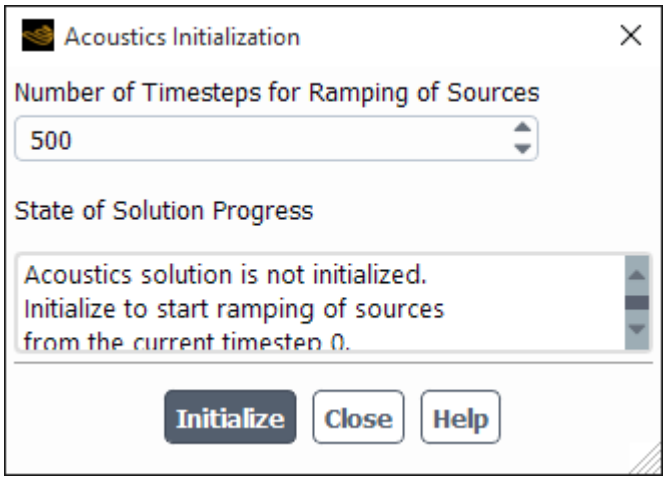
50.14.4. Hybrid Initialization Dialog Box

50.14.1. Acoustics Initialization Dialog Box

The acoustics initialization dialog box allows you to initialize/reinitialize the solution of the acoustics wave equation and to specify how long to ramp acoustic sources.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 50.4: The Acoustics Initialization Dialog Box



Controls

Number of Timesteps for Ramping of Sources

sets how many timesteps the sound sources will ramp to their full values.

50.14.2. Patch Dialog Box

The **Patch** dialog box allows you to patch different values of flow variables into different cells. See Patching Values in Selected Cells (p. 3616) for details about using this feature.

Controls

Reference Frame

indicates whether patched velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent. Also, this selection affects only velocities, so the options will not be available unless you have selected a velocity in the **Variable** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Phase

contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Variable

contains a list of flow variables from which you can choose the variable to be patched. For species transport cases with a single phase flow, only the boundary species that you have selected in the **Select Boundary Species** dialog box (see Figure 18.3: The Select Boundary Species Dialog Box (p. 2365)) appear in the list. You can add or remove a species using the **Select Boundary Species** dialog box that can be accessed by clicking **Species** in the **Initialization** task page.

Volume Fraction Patch Options

contains options that can be used when patching volume fraction for VOF and Eulerian multiphase with Multi-Fluid VOF simulations.

Patch Reconstructed Interface

applies a piecewise-linear reconstruction of the interface when patching a user-defined register and patches cells that intersect the interface with the actual volume fraction.

Volumetric Smoothing

enables smoothing of the volume fraction based on the volumetric average over the cell neighbors. After enabling volumetric smoothing, you can click Smooth to apply smoothing to the volume fraction field for all phases in the entire domain.

Smoothing Relaxation Factor

controls the degree of smoothing applied to the volume fraction field. This can be set between `0` (no smoothing) and `1` (maximum smoothing).

Value

sets a value to be patched for the selected **Variable** (constant, by default). Use the drop-down to the right of the field to select either **Constant** or **Expression** as the method for specifying the **Value**.

Use Field Function

enables the patching of a custom **Field Function**, rather than a constant **Value**, for the selected **Variable**. See Using Field Functions (p. 3618) for details.

Field Function

contains a list of defined custom field functions. If the **Use Field Function** option is enabled, you can patch one of these functions for the selected **Variable**. See Using Field Functions (p. 3618) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zones to Patch

contains a list of cell zones. The specified **Value** or **Field Function** for the selected **Variable** will be patched into the zones you select from this list.

Registers to Patch

contains a list of cell registers that have been created using the adaption tools. You can patch a different value for a group of cells within a single cell zone by selecting a register containing a subset of the cells in the zone. See Using Registers (p. 3618) for details.

Patch

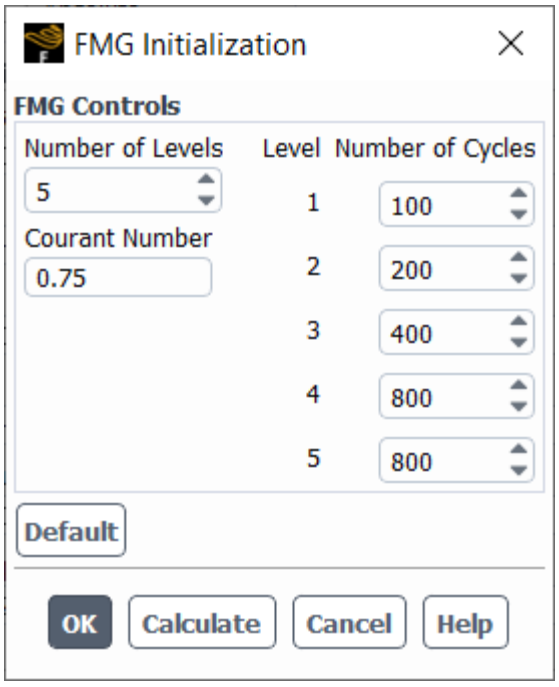
updates the flow-field data based on the inputs above.

Smooth

apply volumetric smoothing to the volume fraction field. This button only appears if **Volumetric Smoothing** is enabled.

50.14.3. Full-Multigrid (FMG) Initialization Dialog Box

The **FMG Initialization** dialog box contains the settings that control the Full-Multigrid Initialization strategy.



FMG Controls

Number of Levels

sets the number of multigrid levels for the FMG iteration (the default is 5).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Cycles

sets the number of cycles per level. The defaults at each level are 100, 200, 400, 800, and 800.

Courant Number

sets the FMG iteration Courant-number (the default is 0.75). This will be the CFL value that the FAS multigrid will use for the FMG initialization.

FMG Options

contains additional FMG customization options supported by the density-based solver (see Additional FMG Initialization Options with the Density-Based Solver (p. 3620)).

Viscous Terms

adds the viscous terms of the Navier-Stokes equation to the FMG initialization procedure.

Species Reactions

adds the species-reactions terms to the FMG initialization procedure.

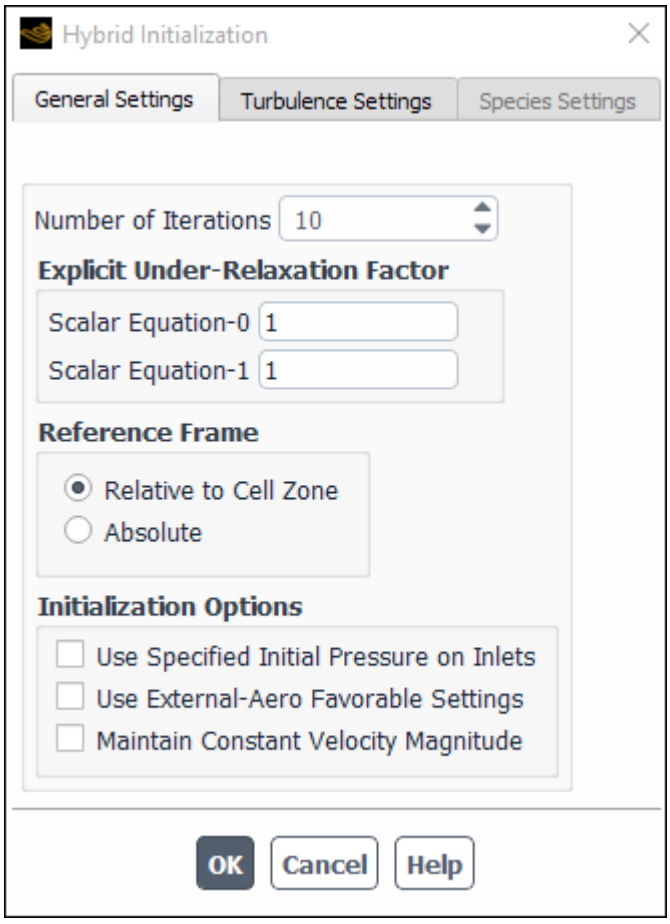
Default

returns the FMG controls to their default values.

50.14.4. Hybrid Initialization Dialog Box

The **Hybrid Initialization** dialog box contains a host of adjustable settings that control the **Hybrid Initialization** strategy.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

General Settings

allow you to adjust such entries as the number of iterations and under-relaxation factors.

Number of Iterations

uses a default value of 10. This is the number of iterations that will be performed while solving the Laplace equations to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to increase the number of iterations and re-initialize the solution.

Explicit Under-Relaxation Factor

uses a default value of 1. This value will be used while solving the Laplace equation to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to adjust the under-relaxation factor and re-initialize the solution.

Reference Frame

indicates whether the initial velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Initialization Options

allows you to include any of the three initialization options.

Use Specified Initial Pressure on Inlets

if you want the specified pressure for **Supersonic/Initialization Gauge Pressure** at the inlet boundaries to be used for solving the Laplace equation for the pressure.

Use External-Aero Favorable Settings

if you want to have the velocity potential patched with a linear value to help accelerate convergence of **Scalar Equation–0** and to obtain a better guess of the velocity field for external-aero problems.

Maintain Constant Velocity Magnitude

if you want to use the flow direction obtained from solving the velocity potential (**Scalar Equation–0**), while maintaining a constant velocity magnitude throughout the computational domain.

Turbulence Settings

uses by default the domain averaged values for the turbulence parameters. If you want to use variable turbulence parameters you can deselect the **Average Turbulent Parameters** check box. When this option is disabled, then it calculates the turbulent parameters, such as kinetic energy, dissipation energy, and so on, using local flow parameters.

Species Settings

will by default initialize secondary species with zero mass or mole fractions. If you want to specify the appropriate value for the species, you must enable **Specify Species Parameters**. Note that only the boundary species that you have selected in he **Select Boundary Species** dialog box (see Figure 18.3: The Select Boundary Species Dialog Box (p. 2365)) appear in the list. You can add or remove a species using the **Select Boundary Species** dialog box that can be accessed by clicking **Species** in the **Initialization** task page.

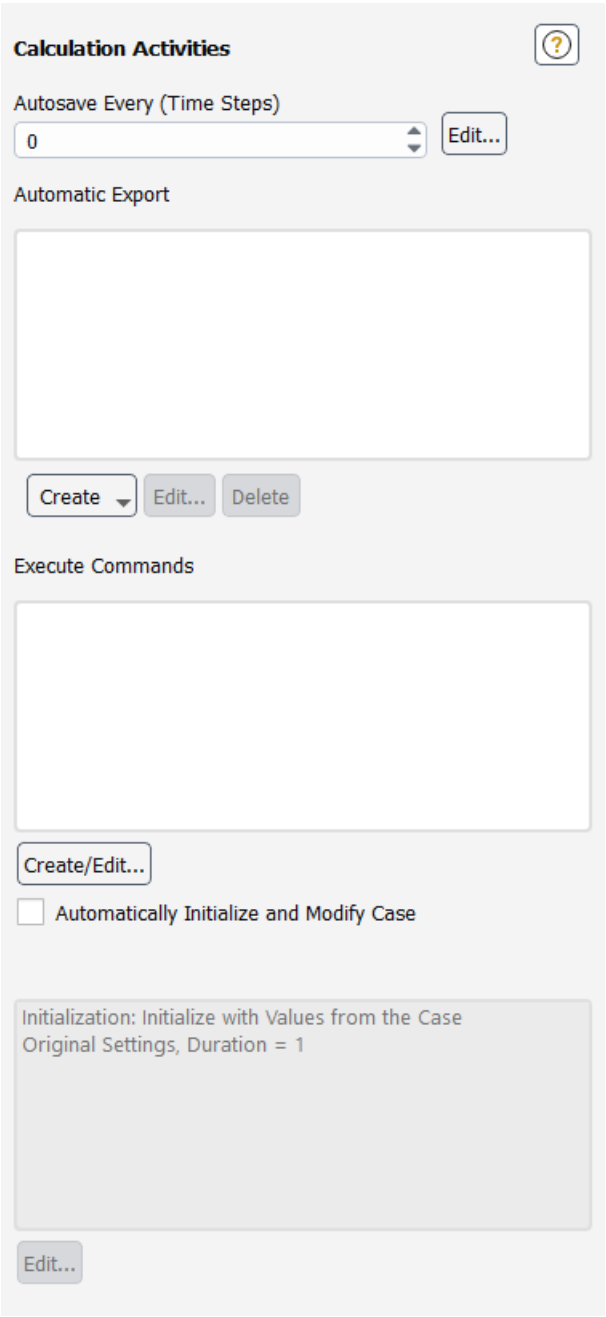
50.15. Calculation Activities Task Page

The **Calculation Activities** task page allows you to set up various tasks that you can perform during the calculation, such as saving files, exporting files, creating solution animations, and command execution.

Important:

This feature offers reduced functionality when running Fluent under the **Pro** capability level.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Autosave Every

allows you to set the frequency of the autosave.

Edit...

opens the Autosave Dialog Box (p. 5136).

Automatic Export

displays a list of available export objects that will be executed during the calculations. This list and its associated buttons are only available for transient flow calculations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create

provides a drop-down list that contains options for creating export objects. Two options are available: the **Solution Data Export** option opens the Automatic Export Dialog Box (p. 5139); the **Particle History Data Export** option opens the Automatic Particle History Data Export Dialog Box (p. 5144).

Edit...

opens the appropriate dialog box for the selected item in the **Automatic Export** list.

Delete

removes the selected item from the **Automatic Export** list.

Execute Commands

lists available commands to be executed during the calculations.

Create/Edit...

opens the Execute Commands Dialog Box (p. 5147).

Automatically Initialize Solution and Modify Case

allows you to automatically have your solution initialized and your case file modified.

Edit...

opens the Case Modification Manager Dialog Box (p. 5150). This button is only available when the **Automatically Initialize Solution and Modify Case** option is enabled.

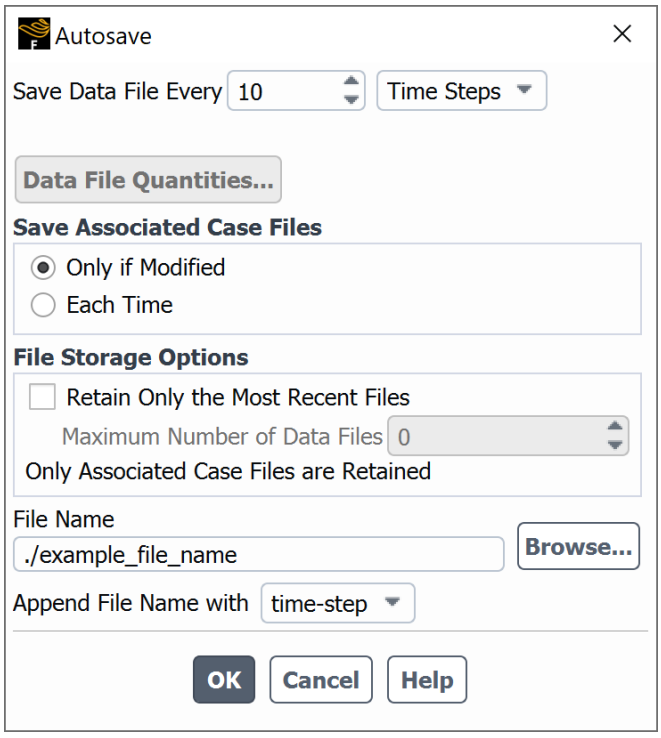
For additional information, see the following sections:

50.15.1. Autosave Dialog Box
50.15.2. Data File Quantities Dialog Box
50.15.3. Automatic Export Dialog Box
50.15.4. Automatic Particle History Data Export Dialog Box
50.15.5. Execute Commands Manager Dialog Box
50.15.6. Execute Commands Dialog Box
50.15.7. Define Macro Dialog Box
50.15.8. Case Modification Manager Dialog Box
50.15.9. Auto Initialization Method Dialog Box
50.15.10. Modify Case Dialog Box

50.15.1. Autosave Dialog Box

The **Autosave** dialog box allows you to specify automatic saving of case and data files at specified intervals during a calculation. See Automatic Saving of Case and Data Files (p. 934) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Save Data File Every

specifies the frequency with which data files are saved. For steady flows you will specify the frequency in iterations, while for unsteady flows you will specify it in either time steps or flow time (unless you are using the explicit time stepping formulation, in which case you will specify the frequency in iterations or if you are running an in-cylinder simulation you can specify the frequency in crank angles). The default value is set to zero, indicating that no automatic saving is performed.

Save Associated Case Files

gives you the choice to save the case file only if it is modified or each time that the data file is saved.

Only if Modified

results in Ansys Fluent saving a case file only if there is a change in the case file settings.

Each Time

allows you to save the case file every time the data file is saved.

Retain Only the Most Recent Files

allows you to restrict the number of files saved by Ansys Fluent if you have limited disk space. When this option is enabled, you can enter the appropriate value in the **Maximum Number of Data Files** field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Only the associated case files are retained when using this option.

Important:

When the **Retain Only the Most Recent Files** option is selected, the solution history currently in memory will be discarded and the solution history reset.

Data File Quantities

opens the Data File Quantities Dialog Box (p. 5138) where you can specify which quantities you want to automatically save to a data file for postprocessing. This button is only available when you are writing in the legacy format (that is, `.dat` files).

Maximum Number of Data Files

specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, Ansys Fluent will overwrite the earliest existing file. The default value for this field is zero, which saves all the files.

File Name

specifies the root name for the files that are saved. The iteration or time-step number and an appropriate suffix (`.cas.h5` or `.dat.h5`, by default) will be added to the specified root name. If the specified **File Name** ends in `.gz` or `.Z` and you have requested the reading and writing of files in the legacy format, appropriate file compression will be performed. (For details about file compression and the legacy format, see Reading and Writing Compressed Files (p. 926) and Reading and Writing Files in the Legacy Format (p. 934), respectively.)

The default path is `./<filename>` indicating that the autosaved files will be saved in the working directory of the current Fluent session. If you hard code a directory, then the files will always be saved at that location, regardless of the working directory of the current Fluent session.

Append File Name with

allows you to select **flow-time**, **time-step**, or **crank-angle** to be appended to the file name. This option is available only for unsteady-state calculations (only for in-cylinder calculations in the case of **crank-angle**). The default selection is **flow-time**.

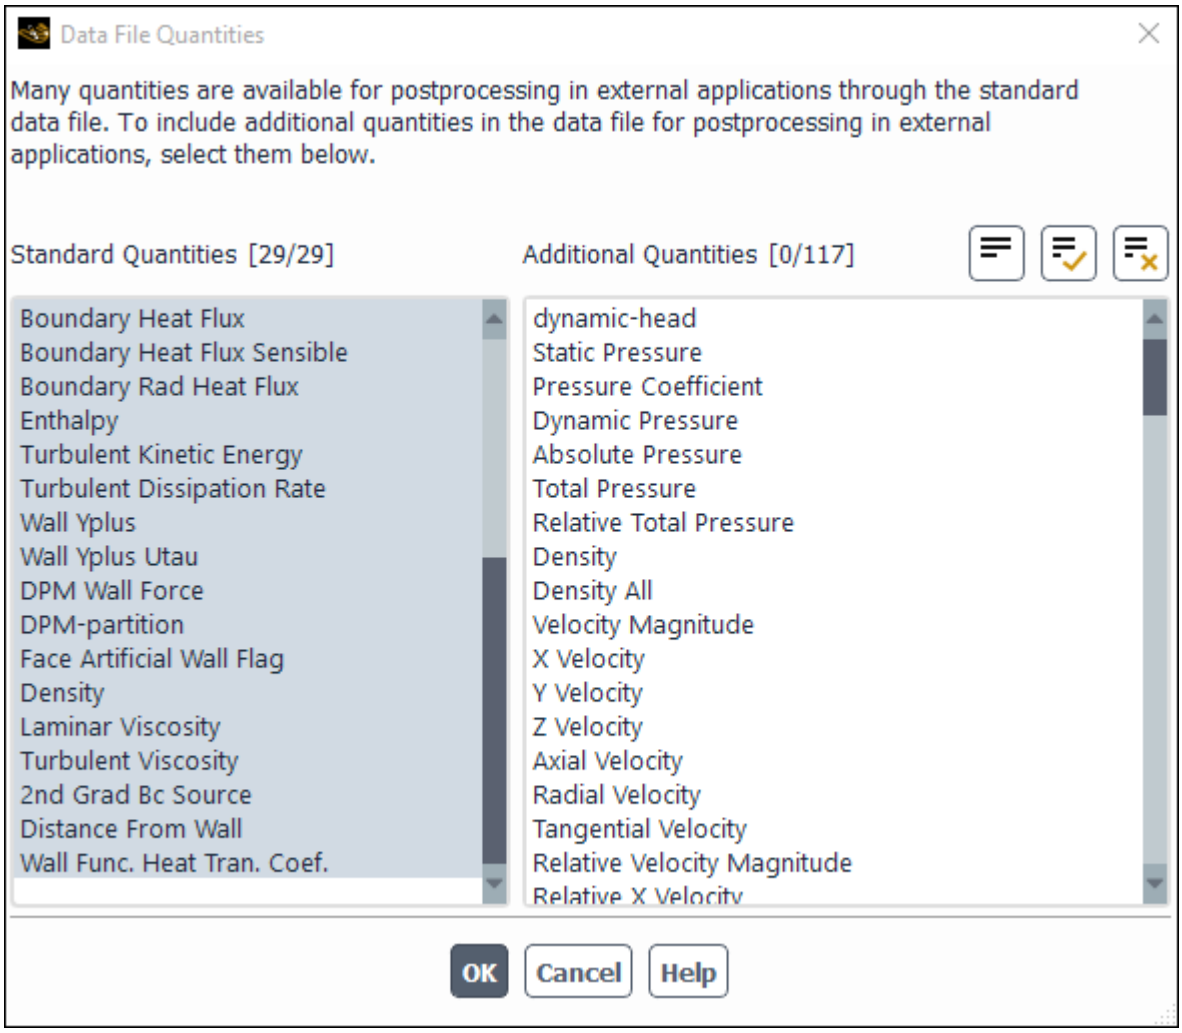
Decimal Places in File Name

allows you to specify the number of decimal digits in the file name. This option is available only when **flow-time** or **crank-angle** is selected in the **Append File Name with** drop-down list. The default value for this field is set to 6.

50.15.2. Data File Quantities Dialog Box

The **Data File Quantities** dialog box allows you to specify various quantities for postprocessing when you are writing in the legacy format (that is, `.dat` files). See Setting Data File Quantities (p. 1001) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Standard Quantities

contains a listing of standard postprocessing quantities (for example, density, Mach number, temperature, and so on).

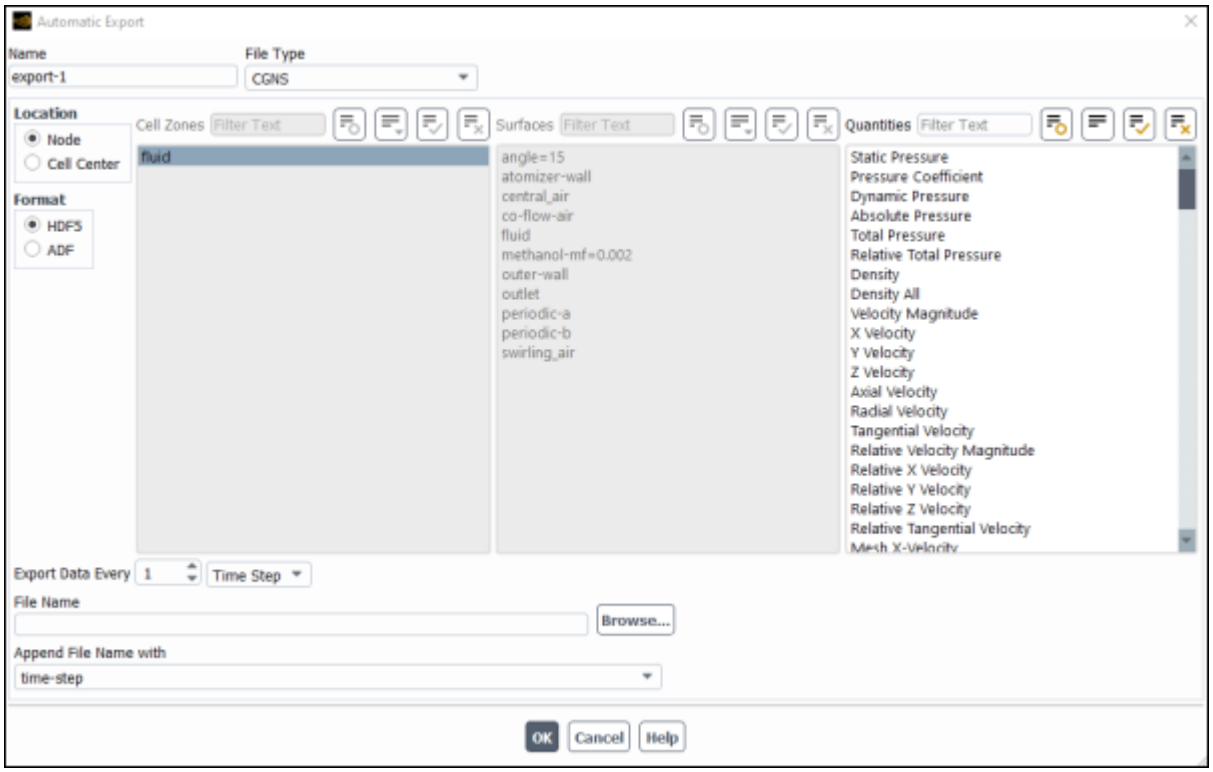
Additional Quantities

contains a listing of additional postprocessing quantities that are derived from the standard quantities (for example, standard pressure, velocity magnitude, and so on).

50.15.3. Automatic Export Dialog Box

The **Automatic Export** dialog box allows you to create an automatic export definition for solution data. See Creating Automatic Export Definitions for Solution Data (p. 978) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the export definition.

File Type

contains a drop-down list of file types, which control the output file format that will be written.

ABAQUS

allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension `.inp`).

ASCII

allows you to specify the surface(s), scalars, location from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an ASCII file.

AVS

allows you to specify the scalars you want to write to be exported to an AVS file.

CDAT for CFD-Post & EnSight

allows you to specify the cell zones, surfaces, quantities, and format (**Binary** or **ASCII**) used for data export. The `.cdat` file format is compatible with both CFD-Post and EnSight.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CGNS

allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a CGNS file (extension `.cgns`).

Common Fluids Format - Post

allows you to specify the cell zones, surfaces, and quantities that you want exported *(note that only nodal values are exported)*. The following files are written in the hierarchical data format (HDF) from the **Automatic Export** dialog box: `<filename>.cas.post` and `<filename>.dat.post`. When Fluent is set up to save files in the default Common Fluids Format (CFF), a project file named `<filename>.flprj` is also written as part of the automatic export; it is recommended that you read this file whenever possible when postprocessing in EnSight, as it contains metadata such as the time values for files exported from transient simulations. Note that if the root name of the exported Common Fluids Format - Post files is the same as that used for case and data files automatically saved during the calculation (through the **Autosave** dialog box), then the metadata from both operations will be written to the same project file.

Data Explorer

allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension `.dx`).

EnSight Case Gold

allows you to specify the scalars you want to write, the cell zones, interior zone surfaces, and location in the cell from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension `.geo`, `.vel`, `.scl1`, or `.encas`).

EnSight DVS

allows you to specify the cell zones or surfaces (not both) and the quantities that you want to write, and whether the data is written for nodes or cell centers. Data is exported in `.dvs` format for import to EnSight.

FAST

allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution

allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured

allows you to specify the scalars you want to write and the cell zones from which the values of scalar functions are to be taken, to be exported to a FIELDVIEW binary file (extension `.fvuns`) and a regions file (extension `.fvuns.fvreg`).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I-deas Universal

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input

allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL Input file (extension `.cdb`).

NASTRAN

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension `.bdf`).

PATRAN

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension `.out`).

TAITherm

allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension `.neu`). This option is available only when the **Energy Equation** is enabled.

Tecplot

allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Cell Zones

specifies the cell zones for which data is to be written for a CFD-Post compatible, EnSight, or FIELDVIEW file.

Surfaces

specifies the surfaces for which data is to be written for an ABAQUS, ASCII, Data Explorer, I-deas Universal, Mechanical APDL Input, NASTRAN, PATRAN, TAITherm, or Tecplot file.

Quantities

specifies valid quantities for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected **File Type**.

Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats)

specifies the finite element analysis intended.

Structural

specifies structural analysis and allows you to select the **Structural Loads** to be written.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thermal

specifies thermal analysis and allows you to select the **Thermal Loads** to be written.

Structural Loads

contains optional structural loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Structural** analysis is selected.

Force

enables force to be written as a load for a structural analysis.

Pressure

enables pressure to be written as a load for a structural analysis.

Temperature

enables temperature to be written as a load for a structural analysis. This option is available only when the **Energy Equation** is enabled.

Thermal Loads

contains optional thermal loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Thermal** analysis is selected.

Temperature

enables temperature to be written as a load for a thermal analysis.

Heat Flux

enables heat flux to be written as a load for a thermal analysis.

Heat Trans Coeff

enables heat transfer coefficient to be written as a load for a thermal analysis.

Location (for ASCII, CGNS, and EnSight Case Gold formats)

specifies the location from which the values of scalar functions are to be taken.

Node

specifies that data values at the node points are to be exported.

Cell Center

specifies that data values from the cell centers are to be exported.

EnSight Parallel

(Available only with Fluent in parallel) creates `.encas` files suitable for use in EnSight Enterprise.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Format (for CDAT for CFD-Post & EnSight and EnSight Case Gold)

specifies the file format.

Binary

specifies the file format as binary.

ASCII

specifies the file format as ASCII.

Heat Transfer Coefficient (for TAITherm format only)

specifies the basis for the heat transfer coefficient exported.

Flux Based

specifies the flux based method for writing the heat transfer coefficient.

Wall Function

specifies the wall function based method for writing the heat transfer coefficient.

Write Case File (for CDAT for CFD-Post & EnSight)

specifies the circumstances under which a case file is written with the `.cdat` file. *It is recommended that you select either **Every Time** or **Only if Case/Mesh Changes** since applications consuming `.cdat` files require a corresponding case/mesh file to consume the data.*

Export Data Every

specifies the frequency for appending the data during the solution process based on either **Time Steps** or **Flow Time**.

File Name

specifies the root name for the files to be saved.

Append File Name with

allows you to select **flow-time** or **time-step** to be appended to the file name.

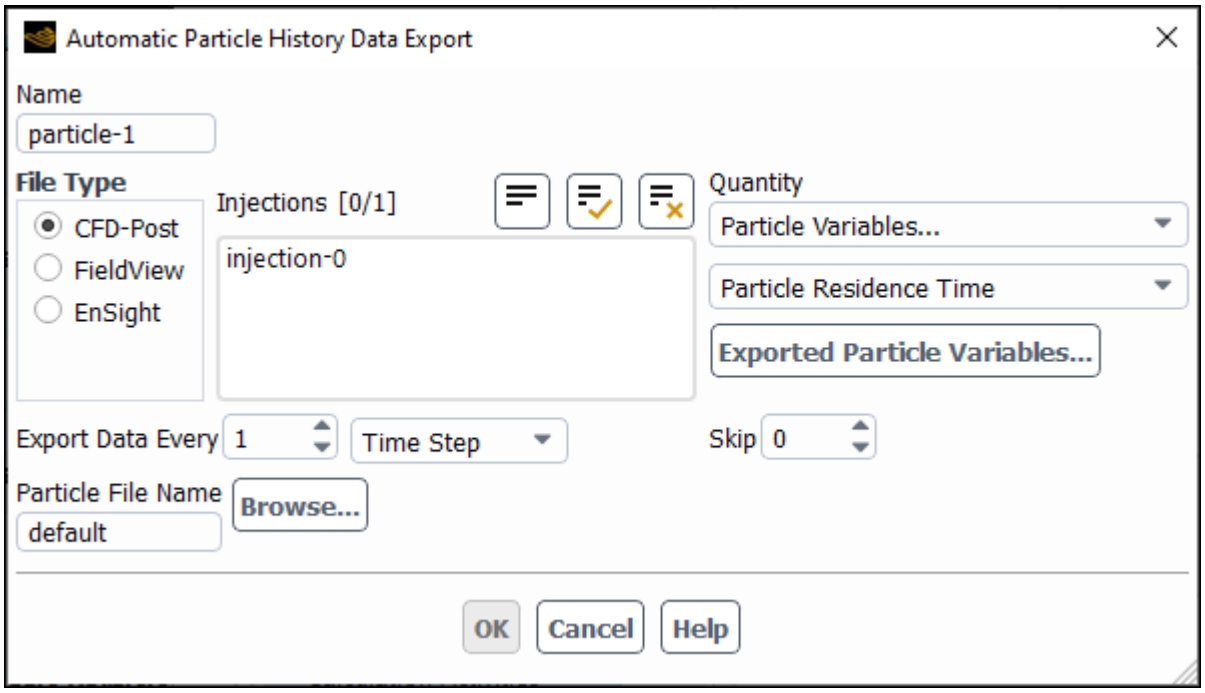
Decimal Places in File Name

allows you to specify the number of decimal digits in the file name. This option is available only when **flow-time** is selected in the **Append File Name with** drop-down list. The default value for this field is set to 6.

50.15.4. Automatic Particle History Data Export Dialog Box

The **Automatic Particle History Data Export** dialog box allows you to create an automatic particle history export definition for solution data. See Creating Automatic Export Definitions for Transient Particle History Data (p. 979) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the particle history export definition.

File Type

specifies the type of the file you want to write.

CFD-Post

allows you to write the file in CFD-Post particle tracks format, which can be read in **CFD-Post**.

FieldView

allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

EnSight

allows you to write the file in **EnSight** format.

Injections

allows you to select the required injection from the list of predefined injections.

Quantity

contains the list of variables for which you can export the particle data.

Skip

allows you to "thin" or "sample" the number of particles that are exported.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Export Data Every

specifies the frequency for appending the data during the solution process. You can export particle history data frequency based on either **Time Step** or **Flow Time** for unsteady flow cases, or based on **DPM Iteration** for steady flow cases.

Separate Files for Each Time Step

allows you to have separate exported data files for each time step. Available only when **EnSight** is selected as the **File Type**.

Particle File Name

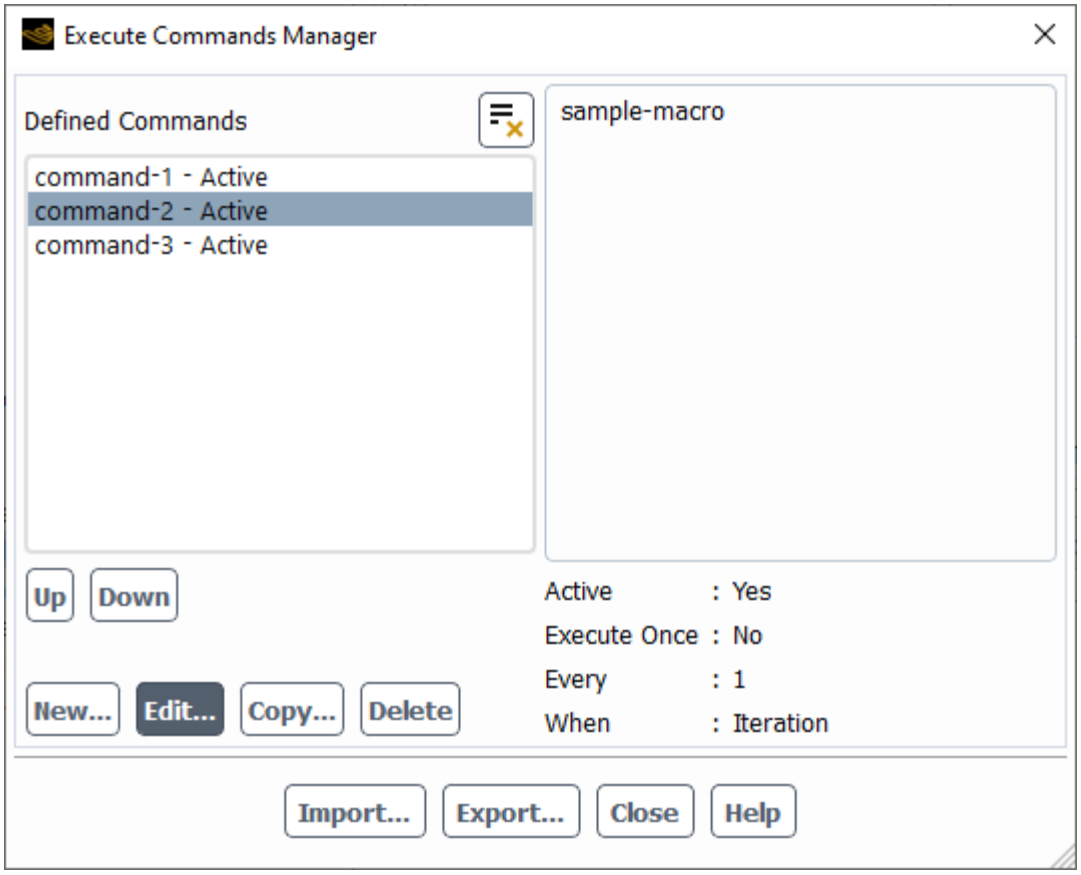
allows you to specify the file name/directory for the exported data, using the **Browse...** button.

Ensight Encas File Name

is the file name you will specify if you selected **EnSight** under **File Type**. Use the **Browse...** button to select the `.encas` file that was created when you exported the file with the **File/Export...** ribbon tab option.

50.15.5. Execute Commands Manager Dialog Box

The **Execute Commands Manager** dialog box allows you to define and manage commands to be executed during the calculation. See Executing Commands During the Calculation (p. 3686) for details about using this feature.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Defined Commands

lists the total number of monitor commands that have been defined. Details for a selected command in the list are provided to the right.

Up

moves the selected command up in the list of **Defined Commands** by one.

Down

moves the selected command down in the list of **Defined Commands** by one.

New...

opens the Execute Commands Dialog Box (p. 5147) where you can create a new command.

Edit...

opens the Execute Commands Dialog Box (p. 5147) where you can edit an existing command.

Copy...

opens the Execute Commands Dialog Box (p. 5147) where you can edit an existing command.

Delete...

removes the selected command from the list of **Defined Commands**.

Import...

opens a file selection dialog box where you can designate the name and location for the tab separated value (TSV) file that will contain your imported command(s).

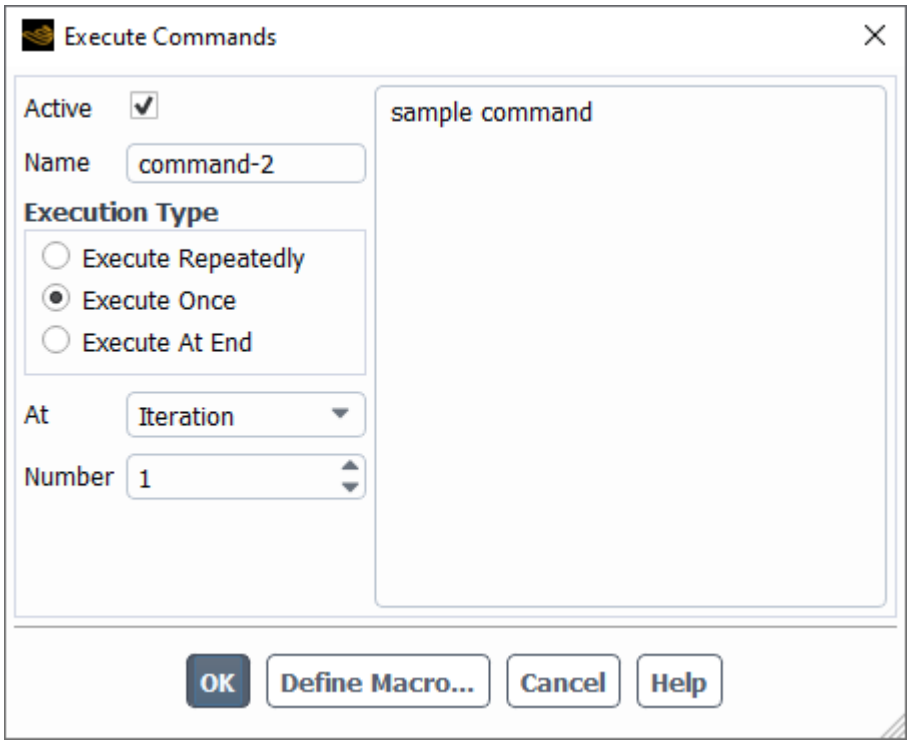
Export...

opens a file selection dialog box where you can designate the name and location for the tab separated value (TSV) file that will contain your exported command(s).

50.15.6. Execute Commands Dialog Box

The **Execute Commands** dialog box allows you to define commands to be executed during the calculation. See Executing Commands During the Calculation (p. 3686) for details about using this feature.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Active

activates/deactivates the execution of each command.

Name

specifies a name for each command.

Execute Repeatedly

Select this option if your command needs to be repeated as part of a sequence of commands.

Every, When

indicate how often the command is to be executed. You can enter the interval under **Every** and select **Iteration**, **Time Step**, **Flow Time**, **Adjoint Iteration**, or **Design Iteration** under **When**. (**Time Step** and **Flow Time** are only valid choices if you are calculating unsteady flow, and **Adjoint Iteration** and **Design Iteration** are only available if you have opened the **Execute Commands** dialog box from the **Gradient-Based Optimizer** or **Run Adjoint Calculation** dialog box.)

Execute Once

Select this option if your command needs to be executed only once.

At/Number

indicate how often the command is to be executed. You can enter the interval under **Number** and select **Iteration**, **Time Step**, **Flow Time**, **Adjoint Iteration**, or **Design Iteration** under

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

At. (**Time Step** and **Flow Time** are only valid choices if you are calculating unsteady flow, and **Adjoint Iteration** and **Design Iteration** are only available if you have opened the **Execute Commands** dialog box from the **Gradient-Based Optimizer** or **Run Adjoint Calculation** dialog box.)

Execute At End

Select this option if your command needs to be executed at the end of the simulation.

Command Field

specifies the command to be executed. You can enter text commands (using multiple lines if required) or the name of a command macro that you have defined in the Define Macro Dialog Box (p. 5149).

Define Macro...

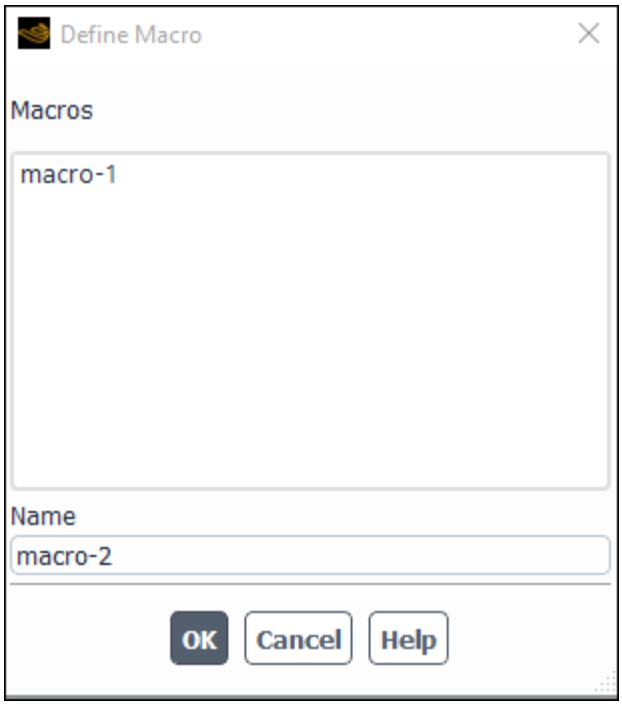
opens the Define Macro Dialog Box (p. 5149), in which you can define command macros.

End Macro

ends the definition of a macro. (This button will replace the **Define Macro...** button when you click **OK** in the **Define Macro** dialog box.)

50.15.7. Define Macro Dialog Box

The **Define Macro** dialog box allows you to define macros for automatic execution by the command monitor, or for interactive use by you. See Defining Macros (p. 3689) for details.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Macros

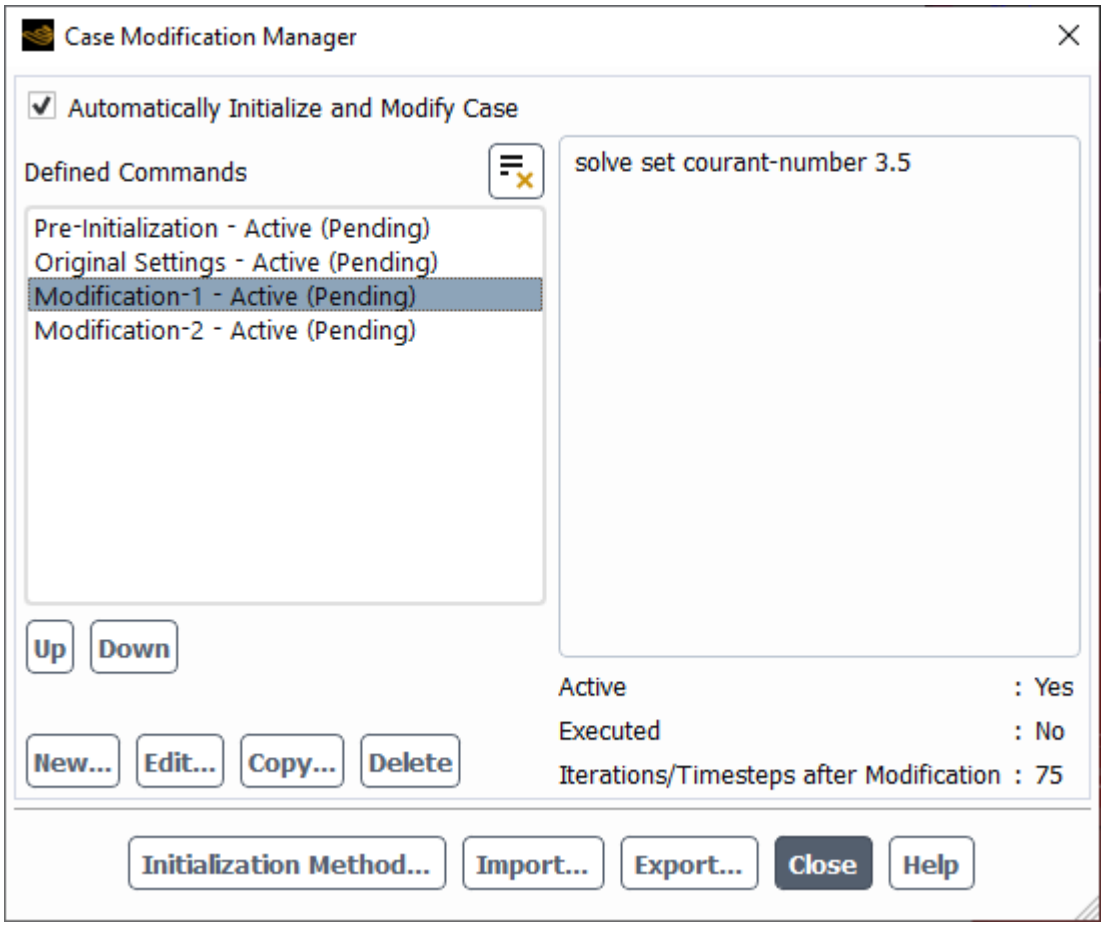
contains a selectable list of the currently-defined macros.

Name

specifies a name for the command macro.

50.15.8. Case Modification Manager Dialog Box

The **Case Modification Manager** dialog box allows you to specify the initialization method and to modify the case. See Automatic Initialization of the Solution and Case Modification (p. 3691) for details.



Controls

Automatically Initialize Solution and Modify Case

allows you to automatically modify the case based on the settings in the dialog box.

Defined Commands

lists your pre-defined commands.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Up

moves the selected command up the list by one increment.

Down

moves the selected command down the list by one.

New...

opens the Modify Case Dialog Box (p. 5152) where you can create a new case modification command.

Edit...

opens the Modify Case Dialog Box (p. 5152) where you can edit an existing case modification command.

Copy

copies the selected command in the list. By default, the copy uses the name of the original command and adds a numerical identifier indicating the number of the copy. For example, making multiple copies of a command `my-new-settings`, gives you copied commands with the default names of `my-new-settings-1`, `my-new-settings-2`, and `my-new-settings-3`, and so on.

Delete

removes the selected command from the list.

Initialization Method...

displays the Auto Initialization Method Dialog Box (p. 5151).

Import...

opens a file selection dialog box where you can locate and select tab-separated value files (`.tsv`) that contain your case modification commands.

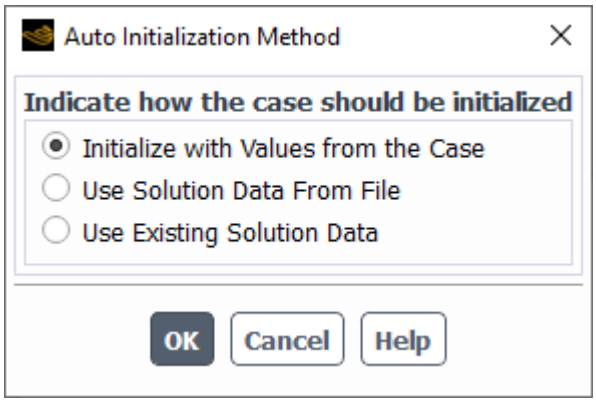
Export...

opens a file selection dialog box where you can specify the name and location of tab-separated value files (`.tsv`) that contain your case modification commands.

50.15.9. Auto Initialization Method Dialog Box

The **Auto Initialization Method** dialog contains several choices for initializing the solution.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Initialize with Values from the Case

uses the values set in the **Solution Initialization** task page.

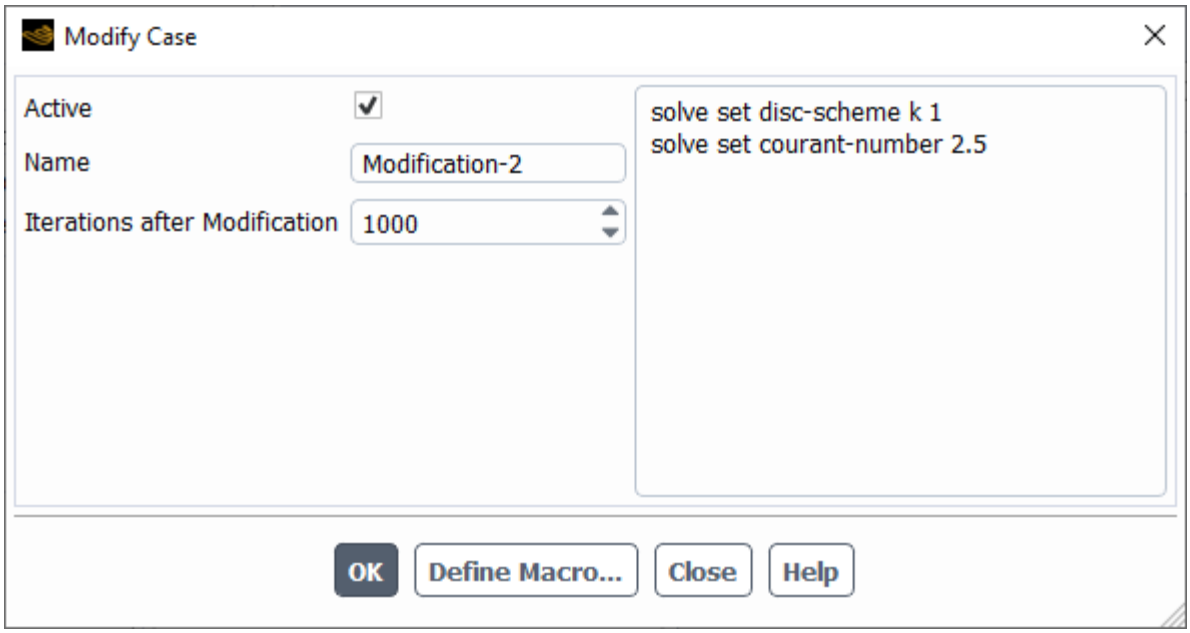
Use Solution Data From File

requires you to read in a data file containing the desired initialization for the case.

Use Existing Solution Data

is analogous to changing the values in a case and continuing the calculation. However, the iteration counter will be reset to 0 so that the modifications can be applied. Use this method when no solution data exists, similar to the first run.

50.15.10. Modify Case Dialog Box



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Active

allows you to enable or disable a defined case modification.

Name

represents the name of the case modification.

Iterations after Modification

represents the number of iterations that you want to run defined case modification commands.

Quality by which to run with case modification

allows you to choose if the case will be modified using **Time Steps** or by using **Flow Time** (available for transient calculations).

Time Steps after Modification

represents the number of time steps that you want to run defined case modification commands (available for transient calculations when **Time Steps** is selected for the case modification quality).

Flow Time after Modification

represents the number of flow time steps that you want to run defined case modification commands (available for transient calculations when **Flow Time** is selected for the case modification quality).

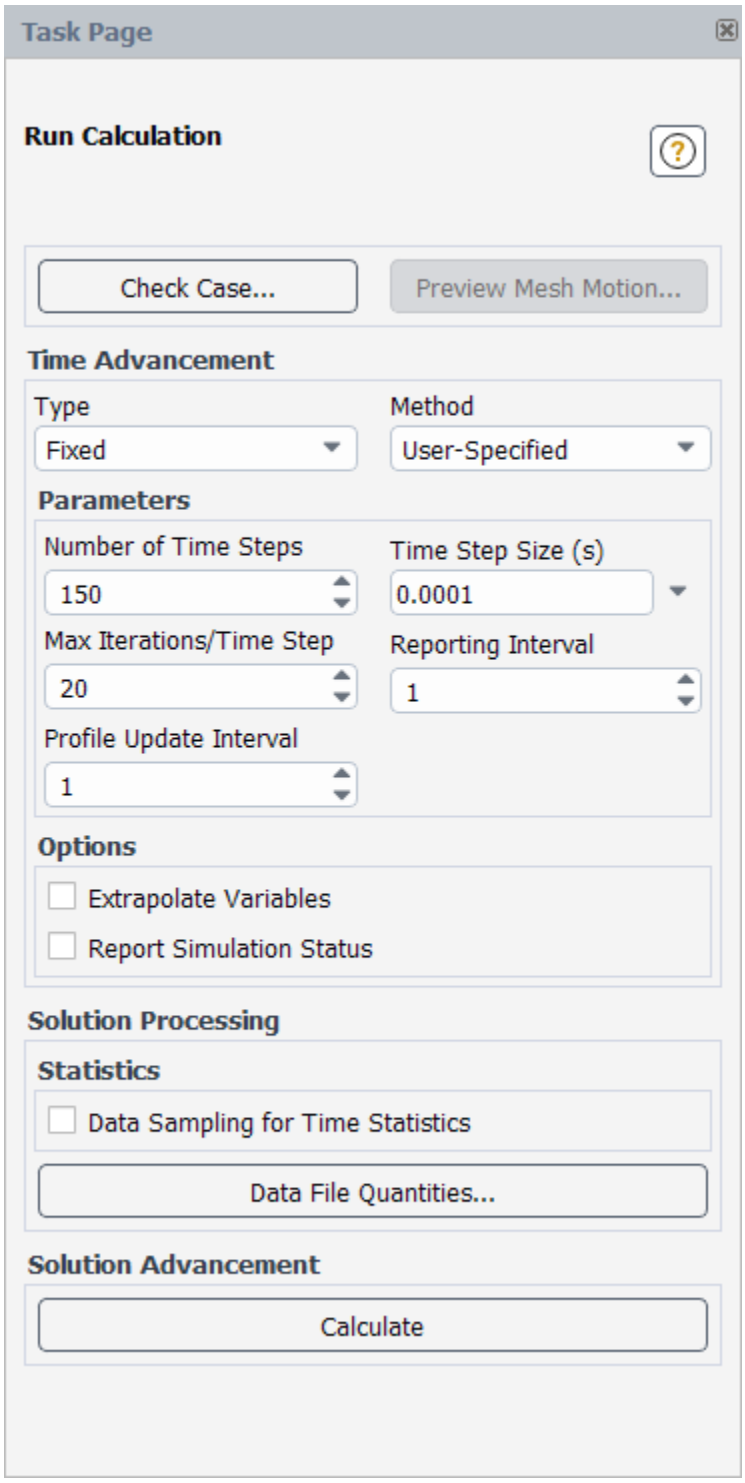
Define Macro...

opens the Define Macro Dialog Box (p. 5149), in which you can define command macros.

50.16. Run Calculation Task Page

The **Run Calculation** task page allows you to start the solver iterations. See Performing Steady-State Calculations (p. 3625) and Performing Time-Dependent Calculations (p. 3629) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Check Case...

opens the Case Check Dialog Box (p. 5165).

Preview Mesh Motion...

opens the Mesh Motion Dialog Box (p. 5097) for transient simulations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Update Dynamic Mesh...

opens the Mesh Motion Dialog Box (p. 5097) for steady simulations.

Pseudo Time Settings

is available for fluid and solid zones when **Global Time Step** is selected from the **Pseudo Time Method** list in the Solution Methods Task Page (p. 5103) as part of a steady-state case with the pressure-based coupled solver or density-based implicit solver. For details about the available options, see Pseudo Time Settings for the Calculation (p. 3666).

Parameters

(for steady flow calculations) contains settings for running, reporting, and updating the calculation.

Number of Iterations

sets the number of iterations to be performed.

Reporting Interval

sets the number of iterations that will pass before residual monitors will be printed and plotted. The default is 1 (that is, reports will be updated after each iteration).

Note that the **Reporting Interval** also specifies how often Ansys Fluent should check if the solution is converged. For example, if your solution converges after 40 iterations, but your **Reporting Interval** is set to 50, Ansys Fluent will continue the calculation for an extra 10 iterations before checking for (and finding) convergence.

Important:

The **Reporting Interval** only affects convergence checking of residuals, not of report definitions.

Profile Update Interval

sets the number of iterations that will pass before user-defined functions for boundary profiles will be updated. This interval also controls the frequency at which named expression values will be updated.

Time Advancement

(for transient flow calculations) contains settings related to time advancement.

Type

allows you to specify the type of time stepping from the following selections. The type you select will determine what further selections are available in the **Method** drop-down list.

Fixed

specifies that the time step size is fixed to a user-specified value or a value based on a specified period or frequency.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Adaptive

specifies that the time step size changes during the solution, in order to either satisfy the Courant–Friedrichs–Lewy (CFL) condition, maintain a certain truncation error associated with the time integration scheme, or satisfy criteria that is specific for multiphase simulations.

User-Defined Function

specifies that the time step size is defined by a user-defined function that uses the `DEFINE_DELTAT` macro.

Method

allows you to select one of the following, to specify how the time step size and number is determined:

User-Specified

(for the **Fixed** type) specifies the use of a fixed time step size, equal to the specified **Time Step Size**.

Period-Based

(for the **Fixed** type) allows you to specify a period (in seconds) as the basis for determining the time step size and number of time steps. See Inputs for Time-Dependent Problems (p. 3631) for details.

Frequency-Based

(for the **Fixed** type) allows you to specify a frequency (in hertz) as the basis for determining the time step size and number of time steps. See Inputs for Time-Dependent Problems (p. 3631) for details.

CFL-Based

(for the **Adaptive** type) specifies the use of a time step size that gets modified by Ansys Fluent as the calculation proceeds such that a version of the Courant–Friedrichs–Lewy (CFL) condition is satisfied, using the specified **Courant Number**. See CFL-Based Time Stepping (p. 3646) for details.

Error-Based

(for the **Adaptive** type) specifies the use of a time step size that gets modified by Ansys Fluent based on the specified truncation **Error Tolerance**. See Error-Based Time Stepping (p. 3649) for details.

Multiphase-Specific

(for the **Adaptive** type) specifies the use of a time step size that will be modified by Ansys Fluent based on the **Global Courant Number** in the interfacial cells. The time-step-size estimation based on the convective time scale is available for all multiphase models that use the implicit or explicit volume fraction formulation, with the exception of the wet steam model. For the VOF model, the time-step-size estimation includes additional constraints

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

based on the physics and the moving mesh Courant number. See Multiphase-Specific Time Stepping (p. 3651) for details.

Duration Specification Method

(for the **Adaptive** or **User-Defined Function** type) specifies the way in which you will define the calculation duration. The duration can be defined by the total time, the total number of time steps, the incremental time, or the number of incremental time steps. In this context, "total" indicates that Fluent will consider the amount of time / steps that have already been solved and stop appropriately, whereas "incremental" indicates that the solution will proceed for a specified amount of time / steps regardless of what has previously been calculated.

Parameters

(for transient flow calculations) contains settings for running, reporting, and updating the calculation.

Number of Time Steps

sets or reports the number of time steps to be performed.

Period

sets or reports the period to be used in the time step size calculation.

Frequency

sets or reports the frequency to be used in the time step size calculation.

Time Steps per Period

sets the number of time steps to divide each period into.

Total Periods

sets the number of periods for the simulation to run.

Total Time

sets the total time that will be calculated, including the time for which results were generated during previous calculations.

Total Number of Time Steps

sets the total number of time steps to be performed, including the number of time steps performed in previous calculations.

Incremental Time

sets the incremental time (that is, the additional time) for which results are to be calculated.

Time Step Size

sets or reports the size of the (physical) time step Δt.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Courant Number

allows you to specify the Courant number for CFL-based time stepping. The default value for the **Courant number** is 1.

Error Tolerance

specifies the threshold value to which the computed truncation error is compared as part of error-based time stepping. Increasing this value will lead to an increase in the size of the time step and a reduction in the accuracy of the solution. Decreasing it will lead to a reduction in the size of the time step and an increase in the solution accuracy, although the calculation will require more computational time. For most cases, the default value of 0.01 is acceptable.

Global Courant Number

allows you to specify the global Courant number for multiphase-specific time stepping. The default value for the **Global Courant number** is 2.

User-Defined Time Step Size

contains a drop-down list of available user-defined functions (UDFs) that can be used to define the time step size.

Number of Fixed Time Steps

specifies the number of fixed-size time steps that should be performed before the size of the time step starts to change. The size of the fixed time step is the value specified for **Initial Time Step Size**.

Initial Time Step Size

is used for the first time step and then for as many subsequent steps as specified in the **Number of Fixed Time Steps** field. This value must fall between the minimum and maximum time step sizes. For a better startup, it should be chosen such that the Courant number initially remains close to 1 or your specified value (whichever is lower). Note that if you initialize the solution for a previously run case with adaptive time stepping, then Ansys Fluent will use the time step size saved in the case.

Max Iterations/Time Step

(when using an implicit unsteady formulation) sets the maximum number of iterations to be performed per time step. If the convergence criteria are met before this number of iterations is performed, the solution will advance to the next time step. See Inputs for Time-Dependent Problems (p. 3631) for details.

Reporting Interval

sets the number of time steps that will pass before residual monitors will be printed and plotted. The default is 1 (that is, reports will be updated after each time step).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note that the **Reporting Interval** also specifies how often Ansys Fluent should check if the solution is converged.

Important:

The **Reporting Interval** only affects convergence checking of residuals, not of report definitions.

Profile Update Interval

sets the number of iterations that will pass before user-defined functions for boundary profiles will be updated. This interval also controls the frequency at which named expression values will be updated.

Time Step Size Update Interval

specifies the number of time steps that will pass before the time step size is updated for adaptive time stepping methods.

Settings...

opens the Adaptive Time Stepping Dialog Box (p. 5166), so that you can define further settings for the adaptive time stepping method.

Options (unsteady)

contains options related to unsteady calculations.

Extrapolate Variables

instructs Ansys Fluent to predict the solution variable values for the next time step and then input that predicted value as an initial guess for the inner iterations of the current time step.

Report Simulation Status

opens the Simulation Status Dialog Box (p. 5167), which reports details about the simulation.

Specify Solid Time Step Size

enables a different time step size to be specified for solid zones, so that it is either user specified or automatically calculated. Using this option to specify a larger solid time step size reduces the risk of convergence issues. It is only available for transient cases, when there is a solid zone in the domain and energy is enabled. See Specifying the Solid Time Step Size (p. 2133) for details.

When this option is enabled, the following are available in the **Solid Time Stepping** group box:

Method

specifies how the time step size is determined for solid zones.

Time Step Size

specifies the time step size for solid zones when you have selected **User-Specified** for the **Method**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Loosely Coupled Conjugate Heat Transfer

works in conjunction with the **Specify Solid Time Step Size** option (and thereby enables the use of a user-specified time step size for solid zones that can be larger than that used for the fluid zones) to increase the robustness of the energy equation calculation, and specifies that multi-domain architecture is used within a single Fluent session to enhance the performance of the simulation. It enables a loose coupling of the fluid and solid zone calculations, either at a specified time period or number of fluid time steps. For further details on using this option and its limitations, see Loosely Coupled Conjugate Heat Transfer (p. 2136).

When this option is enabled, the following are available in the **Loosely Coupled Conjugate Heat Transfer** group box for steady flows:

Coupling Method

allows you to select from the following to determine how the coupling is performed.

Instantaneous Implicit

specifies that the fluid-solid interface is solved in a fully coupled manner like conventional coupled thermal boundary condition at each coupling step. For details, see Thermal Conditions for Two-Sided Walls (p. 1450).

Time-Averaged Explicit

specifies that Dirichlet – Neumann explicit thermal coupling is employed at each coupling step. A convective thermal boundary condition is applied at the wall adjacent to the solid and the instantaneous solid-side temperature is applied on the wall adjacent to the fluid. Time-averaged heat flow on the fluid side is used to compute the convective thermal boundary condition parameters (heat transfer coefficient and free-stream temperature) on the solid side.

Coupling Controls

provides the following controls:

Coupling Frequency Basis

specifies how you will define the coupling frequency. With the **Instantaneous Implicit** coupling method, you can select **Time** so that the coupling is performed at a set **Time Period**; otherwise (if you are not using adaptive time stepping), you can select **Fluid Time Steps** so that the coupling is performed at a set **Number of Fluid Time Steps**.

Time Period

sets the time period for when solid calculations are solved and coupled with the fluid calculations. This field is available when **Time** is selected from the **Coupling Frequency Basis** drop-down list.

Number of Fluid Time Steps

sets the number of fluid time steps used to trigger the solution of the solid calculations and coupling with the fluid calculations. This field is available when **Fluid Time Steps** is selected from the **Coupling Frequency Basis** drop-down list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Average Over (Time Steps)

displays the number of time steps used for computing time-averaged thermal variables. This is available when **Time-Averaged Explicit** is selected for the coupling method, and is shown for information only. The input for this field is automatically copied from the specified **Number of Fluid Time Steps**.

Options (steady-state, pressure-based solver),

contains options for steady-state simulations that use the pressure-based solver.

Loosely Coupled Conjugate Heat Transfer

is an option that can increase the robustness of the energy equation calculation, and specifies that multi-domain architecture is used within a single Fluent session to enhance the performance of the simulation. It enables a loose coupling of the fluid and solid zone calculations at a specified number of iterations. For further details on using this option and its limitations, see Loosely Coupled Conjugate Heat Transfer (p. 2136).

When this option is enabled, the following are available in the **Loosely Coupled Conjugate Heat Transfer** group box for steady flows:

Coupling Method

allows you to select from the following to determine how the coupling is performed.

Implicit

specifies that the fluid-solid interface is solved in a fully coupled manner like conventional coupled thermal boundary condition at each coupling iteration. For details, see Thermal Conditions for Two-Sided Walls (p. 1450).

Explicit

specifies that Dirichlet – Neumann explicit thermal coupling is employed at each coupling iteration. A convective thermal boundary condition is applied at the wall adjacent to the solid and the instantaneous solid-side temperature is applied on the wall adjacent to the fluid. Iteration-averaged heat flow on the fluid side is used to compute the convective thermal boundary condition parameters (heat transfer coefficient and free-stream temperature) on the solid side.

Coupling Controls

provides the following controls:

Number of Iterations

sets the number of iterations used to trigger the solution of the solid calculations and coupling with the fluid calculations.

Average Over (Iterations)

displays the number of iterations used for computing iteration-averaged thermal variables. This is available when **Explicit** is selected for the coupling method, and is shown for

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

information only. The input for this field is automatically copied from the specified **Number of Iterations**.

Options (steady-state, density-based solver)

contains options for steady-state simulations that use the density-based implicit solver.

Solution Steering

allows you to set parameters that will help Ansys Fluent guide the calculations to a converged solution. This option is only available for steady-state simulations that use the density-based implicit solver. See Solution Steering (p. 3732) for more information. When enabled, the following options are available:

Flow Type

allows you to select the flow type that best describes the flow in the solution domain. Five choices are available: **incompressible**, **subsonic**, **transonic**, **supersonic**, and **hypersonic**.

Use FMG Initialization

allows for full multigrid initialization.

First- to Higher-Order Blending

allows you to reduce the desired solution accuracy by selecting a blending factor less than 100%. The default setting is 100%. See First- to Higher-Order Blending in the Theory Guide for more information. The blending factor will be grayed out if **Second Order Upwind** discretization for the **Flow** equations is not selected in the **Solution Methods** task page. The solution accuracy may be reduced (typical values are 75% or 50%) if it is not possible to obtain a converged solution with the maximum second-order accuracy (blending = 100%).

More Settings...

opens the Solution Steering Dialog Box (p. 5168).

Courant Number

is a non-adjustable field displaying the current CFL number, which allows you to view it during the calculation.

Solution Processing

contains controls related to the processing of the calculations.

Acoustic

contains controls for simulations that use the FW-H acoustics model.

Time Step Size for Acoustic Data Export

determines the highest frequency that the acoustic analysis reproduces. This is available for the density-based solver when both the explicit formulation and explicit transient formulation are selected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Acoustic Sources FFT...

opens the Acoustic Sources FFT Dialog Box (p. 5170). This button is only available for three-dimensional transient simulations, when the **Export Acoustic Source Data in ASD Format** option is enabled in the **Acoustics Model** dialog box.

Acoustic Signals...

opens the Acoustic Signals Dialog Box (p. 5176).

Pollutants

contains controls for simulations that model pollutant formation.

Postprocess Pollutants

results in the automatic postprocessing of pollutants during a transient simulation.

Max Post Iterations/Time Step

sets the maximum number of postprocessing iterations to be performed per time step. This field is available when the **Postprocess Pollutants** option is enabled.

PDF Transport Time Averaging

contains solution controls for steady-state simulations that use the composition PDF transport model with the Lagrangian method.

Iterations in Average

specifies the number of iterations included in the PDF transport time averaging. For recommendations on how to use this setting, see Monitoring the Solution (p. 2449).

Iteration Increment

specifies the rate at which the number of iterations included in the PDF transport time averaging will increase in each subsequent iteration. For recommendations on how to use this setting, see Monitoring the Solution (p. 2449).

Statistics

contains controls for sampling statistics.

Data Sampling for Steady Statistics

enables the sampling of data during a steady-state calculation. See Performing Steady-State Calculations (p. 3625) and Postprocessing for Time-Dependent Problems (p. 3655) for details.

Data Sampling for Time Statistics

enables the sampling of data during an unsteady calculation. See Inputs for Time-Dependent Problems (p. 3631) and Postprocessing for Time-Dependent Problems (p. 3655) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sampling Interval

allows you to specify the frequency of the **Data Sampling for Steady Statistics** or **Data Sampling for Time Statistics**.

Sampled Iterations

reports the number of iterations over which data has been sampled for the postprocessing of the mean and RMS values.

Sampled Time

reports the time period over which data has been sampled for the postprocessing of the mean and RMS values.

Sampling Options...

opens the Sampling Options Dialog Box (p. 5178) for the **Data Sampling for Steady Statistics** or **Data Sampling for Time Statistics**.

Data File Quantities...

opens the Data File Quantities Dialog Box (p. 5138). This button is only available when you are writing in the legacy format (that is, `.dat` files).

Solution Advancement

contains buttons that advance the solution.

Calculate

starts the calculations. While the calculation is in progress, a progress bar will appear at the bottom of the Fluent window. For steady-state simulations, clicking the **Stop** button next to the progress bar will interrupt the calculation at the earliest safe stopping point after the current iteration; for transient simulations, buttons are available that allow you to stop the calculation at the end of the current iteration or time step. Alternatively, you can type **Ctrl**+**c** in the console; for transient simulations, a single instance will stop the calculation at the end of the current time step, whereas typing it twice will stop it at the end of the current iteration.

Continue Calculation

continues the calculations. This button is available when you have enabled the **Automatically Initialize and Modify Case** option in the **Calculation Activities** task page.

Start Calculation Over

restarts the calculation from the beginning. This button is available when you have enabled the **Automatically Initialize and Modify Case** option in the **Calculation Activities** task page.

For additional information, see the following sections:

50.16.1. Case Check Dialog Box

50.16.2. Adaptive Time Stepping Dialog Box

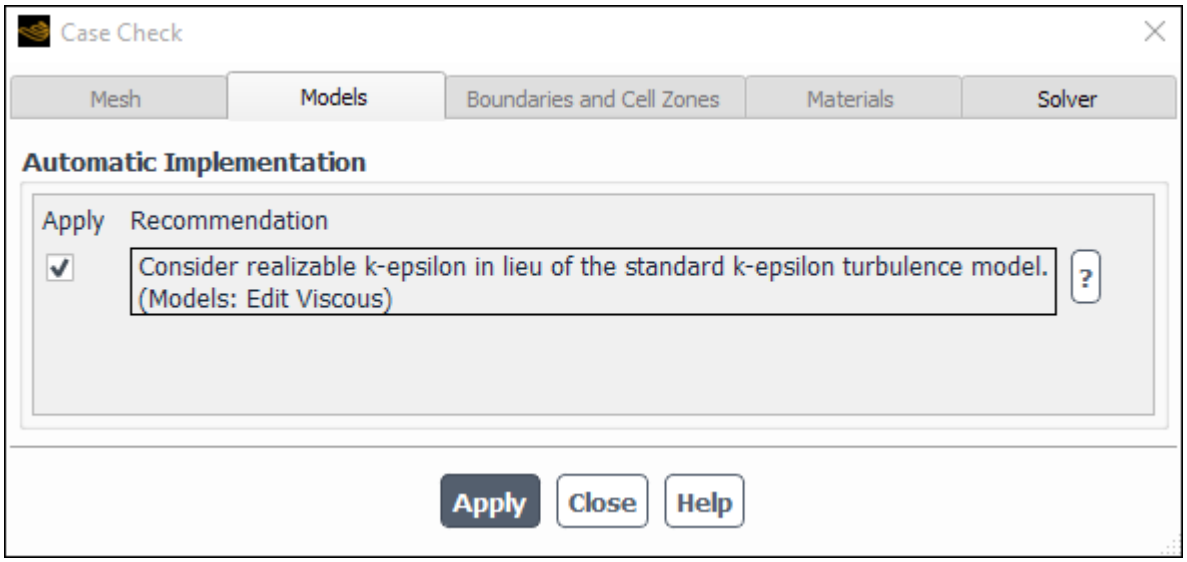
50.16.3. Simulation Status Dialog Box

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.16.4. Solution Steering Dialog Box
50.16.5. Acoustic Sources FFT Dialog Box
50.16.6. Acoustic Signals Dialog Box
50.16.7. Sampling Options Dialog Box
50.16.8. Zone-Specific Sampling Options Dialog Box

50.16.1. Case Check Dialog Box

This function provides you with guidance and best practices when choosing case parameters and models. Your case will be checked for compliance in the mesh, models, boundary and cell zone conditions, material properties, and solver categories. Established rules are available for each category, with recommended changes to your current settings. Information about each of the recommendations is available in Checking Your Case Setup (p. 3710).



Controls

Mesh

displays recommendations, if any, relating the to the mesh used in the case. See Checking the Mesh (p. 3713) for details.

Models

displays recommendations, if any, relating the to the models used in the case. See Checking Model Selections (p. 3715) for details.

Boundaries and Cell Zones

displays recommendations, if any, relating the to the cell zones or boundaries defined in the case. See Checking Boundary and Cell Zone Conditions (p. 3717) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Materials

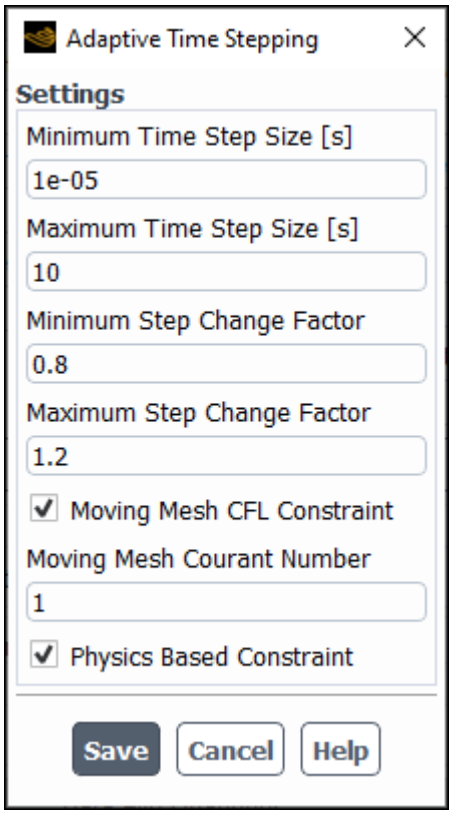
displays recommendations, if any, relating the to the materials defined in the case. See Checking Material Properties (p. 3720) for details.

Solver

displays recommendations, if any, relating the to the solver settings used in the case. See Checking the Solver Settings (p. 3721) for details.

50.16.2. Adaptive Time Stepping Dialog Box

The **Adaptive Time Stepping** dialog box provides additional settings that affect the adaptive time stepping. This dialog box opens when you click **Settings...** in the **Run Calculation** task page. See Performing Time-Dependent Calculations (p. 3629) for details about adaptive time stepping.



Controls

Minimum/Maximum Time Step Size

specify the upper and lower limits for the size of the time step. If the time step size becomes very small, the computational expense may be too high; if the time step size becomes very large, the solution accuracy may not be acceptable to you. You can set the limits that are appropriate for your simulation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Minimum/Maximum Step Change Factor

limit the degree to which the time step size can change at each time step. Limiting the change results in a smoother calculation of the time step size, especially when high-frequency noise is present in the solution. For the **CFL-Based** and **Multiphase-Specific** methods, the time step size change factor is computed as the ratio between the current time step size and the previous time step size. For the **Error-Based** method, the time step size change factor is computed as the ratio between the specified truncation error tolerance and the computed truncation error.

Moving Mesh CFL Constraint

(VOF model only) provides an option to include moving mesh CFL constraint in the time step size estimation. When this option is enabled, you can adjust **Moving Mesh Courant Number**, which has a default value of 1. For applications with a pure rigid body motion, **Moving Mesh Courant Number** may not be a significant parameter.

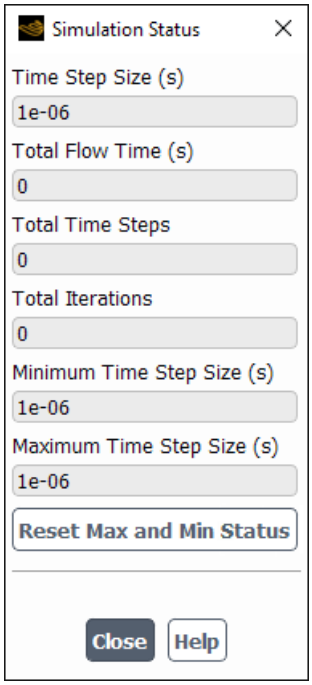
This item is available only for applications that involve either Frame Motion, or Mesh Motion, or Dynamic Mesh. See The Multiphase-Specific Time Stepping Algorithm (p. 3651) for details.

Physics Based Constraint

(VOF model only) provides an option to include physics-based constraints (depending on a specific type of physics involved, such as viscous, acoustic, gravitational, surface-tension-driven, and so on) in the time-step-size estimation. See The Multiphase-Specific Time Stepping Algorithm (p. 3651) for details.

50.16.3. Simulation Status Dialog Box

The **Simulation Status** dialog box reports details about the simulation.



Controls

Time Step Size

(for adaptive time stepping) reports the size of the last time step calculated for the simulation.

Total Flow Time

reports the total time calculated for the simulation.

Total Time Steps

reports the number of time steps calculated for the simulation.

Total Iterations

reports the number of iterations calculated for the simulation.

Minimum Time Step Size

(for adaptive time stepping) reports the size of the smallest time step used since either the start of the simulation or the last time you clicked the **Calculate** button in the **Run Calculation** task page, depending on whether you have clicked the **Reset Min and Max Status** button.

Maximum Time Step Size

(for adaptive time stepping) reports the size of the largest time step used since either the start of the simulation or the last time you clicked the **Calculate** button in the **Run Calculation** task page, depending on whether you have clicked the **Reset Min and Max Status** button.

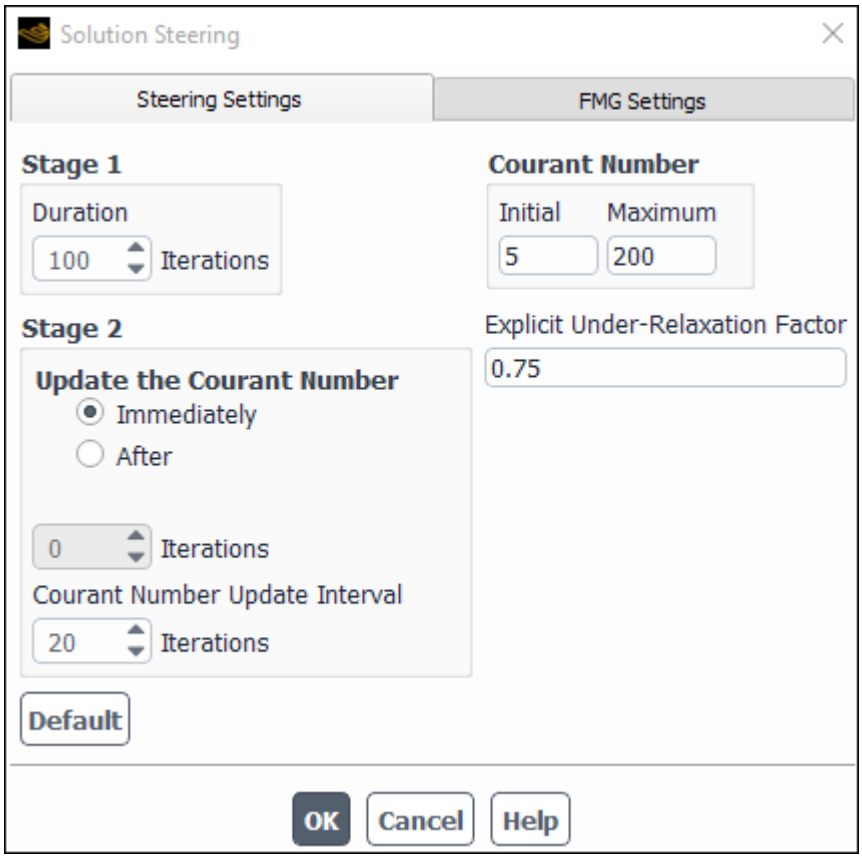
Reset Min and Max Status

(for adaptive time stepping) resets the **Minimum Time Step Size** and **Maximum Time Step Size** fields, so that they consider only the values since the latest time you clicked the **Calculate** button in the **Run Calculation** task page.

50.16.4. Solution Steering Dialog Box

The **Solution Steering** dialog box is used to set the parameters that control the solution steering strategy. Solution steering will typically perform full multigrid (FMG) initialization followed by two iterative stages (Stage 1 and Stage 2). The purpose of Stage 1 is to navigate the solution from the difficult initial phase of the solution toward convergence by insuring maximum stability. During this stage, the solution is advanced gradually from 1st-order accuracy to maximum accuracy (user specified and typically 2nd-order) at a constant low CFL value. In Stage 2, the solution is driven hard towards convergence by regular adjustments of the CFL value to insure fast convergence as well as to prevent possible divergence. In Stage 2, the residual history is monitored and analyzed through regular intervals to determine if an increase or decrease in CFL value is needed to obtain fast convergence or to prevent divergence. See Solution Steering (p. 3732) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Steering Settings

allows you to modify the steering parameters used in Stages 1 and 2.

Stage 1

allows you to set parameters relating to stage 1.

Duration

is the number of iterations in stage 1. The CFL number used during these iterations is set in the **Initial** field, in the **Courant Number** group box.

Stage 2

allows you to set parameters relating to stage 2.

Update the Courant Number

allows you to update the Courant number either **Immediately**, or **After** a specified number of iterations.

Courant Number Update Interval

defines the frequency at which the Courant number is updated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Courant Number

allows you to set the starting (**Initial**) and maximum allowed (**Maximum**) Courant number values. The solution steering algorithm will not allow the solver to exceed the maximum Courant number, but will allow the solver to use a Courant number less than the initial Courant number if divergence in the solution has occurred.

Explicit Under-Relaxation Factor

allows the solution to be under-relaxed to improve convergence.

Default

resets any changes made to the parameters to their original default values.

FMG Settings

allows you to set FMG parameters. For more information about FMG initialization, refer to Full Multigrid (FMG) Initialization (p. 3619).

Number of Multigrid Levels

allows you to set the number of multigrid levels.

Number of Cycles

allows you to set the number of cycles for a selected level.

FMG Courant Number

allows you to set the FMG Courant number.

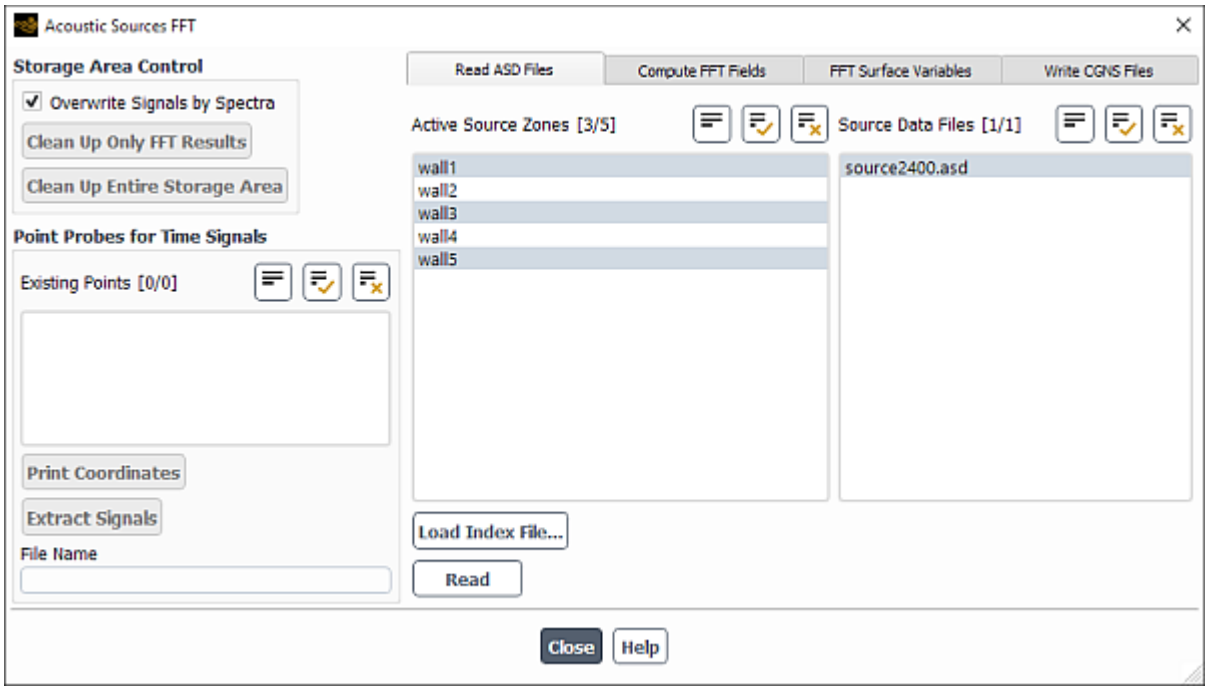
Default

resets any changes to the original default values.

50.16.5. Acoustic Sources FFT Dialog Box

The **Acoustic Sources FFT** dialog box allows you to: read pressure signals from the acoustic source data (ASD) files (see Writing Source Data Files (p. 2630)); compute Fourier spectra of these signals at the selected point probes and over the entire source zones; create surface variables for visualizing the spectral properties of the flow pressure signals; and write CGNS files of the spectrum data. See FFT of Acoustic Sources: Band Analysis and Export of Surface Pressure Spectra (p. 2642) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Storage Area Control

allows you to specify how memory is allocated in the storage area (that is, the large memory array that stores the fields of the pressure histories and the computed fields of the Fourier spectra) when you compute the FFT fields in the **Compute FFT Fields** tab.

Overwrite Signals by Spectra

specifies that the Fourier spectra displace in memory the original time signals, so that they are not kept after the FFT has been computed.

Clean Up Only FFT Results

de-allocates the storage area—so that you can re-compute the FFT without re-reading the pressure histories—and deletes all variables created through the **FFT Surface Variables** tab. This button is only available when the **Overwrite Signals by Spectra** option is disabled.

Clean Up Entire Storage Area

de-allocates the storage area—so that you can re-read ASD files and re-compute the FFT with a clipped time range or different window function—and deletes all variables created through the **FFT Surface Variables** tab.

Point Probes for Time Signals

allows you to get information about existing point probes and create pressure history files.

Existing Points

lists all of the point probes created through the Point Surface Dialog Box (p. 5525) that are available for selection.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Print Coordinates

prints in the console the coordinates of the point probe(s) selected in the **Existing Points** selection list.

Extract Signals

creates ASCII files that contain the pressure histories of the point probe(s) selected in the **Existing Points** selection list.

File Name

specifies a prefix for the names of the files created by the **Extract Signals** button.

Read ASD Files

allows you to read pressure histories from the acoustic source data (ASD) files.

Active Source Zones

is a list of the face zones for which you can read acoustic source data.

Source Data Files

is a list of the ASD files you can read.

Load Index File...

updates the **Active Source Zones** and **Source Data Files** lists by loading an ASCII index file.

Read

reads the pressure signals from the selected items in the **Active Source Zones** and **Source Data Files** lists.

Compute FFT Fields

allows you to compute FFT fields from the pressure signals read through the **Read ASD Files** tab.

Sampling Data

allows you to reduce the time range of the signal data used to compute the FFT fields.

Clip Time to Range

specifies that the time range of the data sampled is reduced to be between the **Min** and **Max**.

Min

specifies the minimum value of the time range of the signal data when the **Clip Time to Range** option is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Max

specifies the maximum value of the time range of the signal data when the **Clip Time to Range** option is enabled.

Time Step

reports the size of the time step at which data was sampled.

Re-Estimate Spectral Resolution

updates the values that are displayed in the **Spectral Resolution** group box and that are used to compute the FFT fields, based on the settings in the **Sampling Data** group box.

Spectral Resolution

displays the number of samples and the expected spectrum properties for the provided signals.

Number of Samples

reports the total number of samples in the specified time range.

Samples Used for FFT

reports the number of samples that will be used for FFT (see Table 39.2: Numbers of Data Points Supported by the Prime-Factor FFT Algorithm (p. 4047)).

Frequency Min & Step

reports the expected minimum frequency in the spectrum, which is also the expected frequency step.

Frequency Max

reports the expected maximum frequency in the spectrum.

Number of Modes

reports the expected number of Fourier modes in the spectrum.

Window Function

specifies the shape of the window function used to enforce the signal's periodicity. See Windowing (p. 4046) for details. The default is the **Hanning** window.

Compute

computes the FFT fields based on the settings in the **Compute FFT Fields** tab.

FFT Surface Variables

allows you to create new Fluent variables for postprocessing using the spectrum fields computed through the **Compute FFT Fields** tab.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Modes/Frequency Bands

specifies what the created variables will characterize.

Octave Bands

specifies that the variables characterize proportional frequency bands corresponding to the standard technical octaves.

1/3 Octave Bands

specifies that the variables characterize proportional frequency bands corresponding to the standard technical thirds.

Constant Width Bands

specifies that the variables characterize user-defined equidistant frequency bands.

Set of Modes

specifies that the variables characterize the individual Fourier modes.

Octave Central Frequencies

is a list of the octave central frequencies for which you can **Create** Fluent variables for post-processing. This selection list is available when **Octave Bands** is selected from the **Modes/Frequency Bands** drop-down list.

1/3-Octave Central Frequencies

is a list of the 1/3-octave central frequencies for which you can **Create** Fluent variables for postprocessing. This selection list is available when **1/3-Octave Bands** is selected from the **Modes/Frequency Bands** drop-down list.

Frequency Min

specifies the minimum frequency of the set of modes for which you want to **Create** Fluent variables for postprocessing. This field is available when **Set of Modes** or **Constant Width Bands** is selected from the **Modes/Frequency Bands** drop-down list.

Frequency Max

specifies the maximum frequency of the set of modes for which you want to **Create** Fluent variables for postprocessing. This field is available when **Set of Modes** or **Constant Width Bands** is selected from the **Modes/Frequency Bands** drop-down list.

Number of Modes to Skip

allows you to thin or sample the modes for which you want to **Create** the Fluent variables for postprocessing. This field is available when **Set of Modes** is selected from the **Modes/Frequency Bands** drop-down list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Band Width

specifies the width of the constant width bands, for which you want to **Create** the Fluent variables for postprocessing. This field is available when **Constant Width Bands** is selected from the **Modes/Frequency Bands** drop-down list.

Spectrum Property

displays the type of variables created according to the selected choice in the **Modes/Frequency Bands** drop-down list.

PSD of dp/dt

is displayed when frequency bands are selected from the **Modes/Frequency Bands** drop-down list, in order to indicate that the created variables will be the power spectral density (PSD) fields, calculated for the time derivative of flow pressure.

Surface Pressure Level

is displayed when frequency band is selected from the **Modes/Frequency Bands** drop-down list, in order to indicate that the created variables will be the surface pressure level (SPL) fields, in decibels.

Real and Imaginary Amplitude Parts

is displayed when **Set of Modes** is selected from the **Modes/Frequency Bands** drop-down list, in order to indicate that the created variables will be the real and imaginary parts of the complex Fourier amplitudes, with a pair of variables per specified mode.

Existing Variables

lists the processed variables that have been created by the **Create** button, and allows you to make selections for deletion using the **Remove Selected Variables** button.

Remove Selected Variables

deletes the processed variables selected in the **Existing Variables** list from the storage area (as described previously), so that you can analyze more than the maximum of 20 individual modes or constant width bands that are allowed to exist at any one time.

Write Area-Avg Data

When selected, and upon clicking **Create**, Fluent writes the area-averaged pressure data to an ASCII file in the XY plot file format.

Plot Area-Avg Data

When selected, and upon clicking **Create**, Fluent plots the area-averaged pressure data in the form of a bar chart in the graphics window.

Create

creates new Fluent variables for postprocessing (based on your settings in the **FFT Surface Variables** tab), updates the **Existing Variables** selection list, and (when **Set of Modes** or

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Constant Width Bands is selected from the **Modes/Frequency Bands** drop-down list) prints information in the console.

Write CGNS Files

allows you to write CGNS files of the spectrum data.

Processed Source Zones

is a list of the zones you can export.

Frequency Series

allows you to reduce the exported spectrum data.

Reduce Frequency Series

specifies that the exported spectrum data is reduced to be between the **Min** and **Max**.

Min

specifies the minimum of the frequency range to be exported when the **Reduce Frequency Series** option is enabled.

Max

specifies the maximum of the frequency range to be exported when the **Reduce Frequency Series** option is enabled.

Number of Frequencies to Skip

allows you to thin or sample the frequencies to be exported.

Number of Frequencies per File

specifies the number of frequencies exported in each file. A value should be chosen based on the **Number of Modes** field of the **Compute FFT Fields** tab, in order to avoid creating either extremely large output files or a large number of very small files.

File Name

specifies the base file name of the output files.

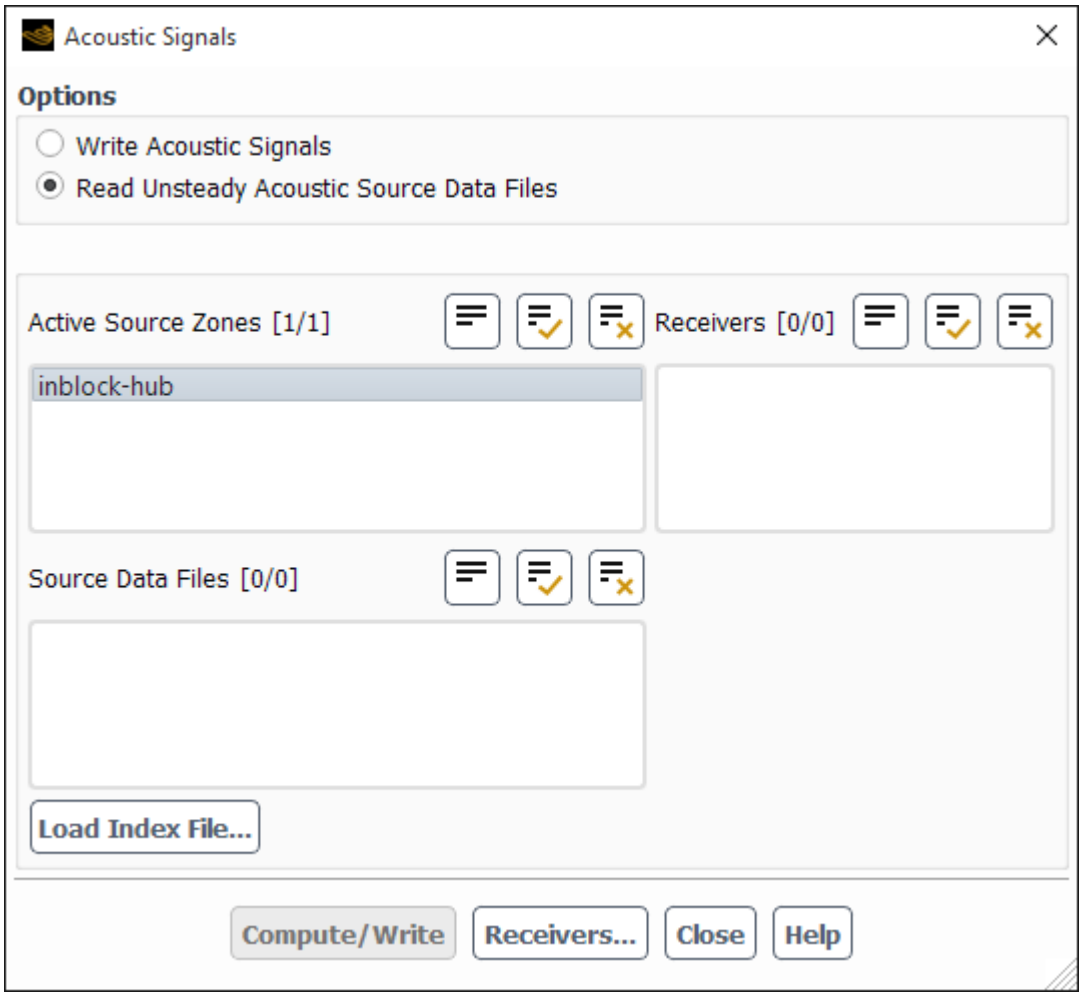
Write

writes CGNS files of the spectrum data.

50.16.6. Acoustic Signals Dialog Box

The **Acoustic Signals** dialog box is used to compute and save the sound pressure signals. See Post-processing the FW-H Acoustics Model Data (p. 2639) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the options available for acoustic signal postprocessing.

Write Acoustic Signals

enables the parameters needed to write the sound pressure data to files.

Read Unsteady Acoustic Source Data Files

enables the parameters needed to compute the sound pressure signals using the source data saved to files.

Active Source Zones

contains source zones you want to include to compute sound. See Specifying Source Surfaces (p. 2633) for details.

Receivers

contains all the receivers for which you can compute sound.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Source Data Files

contains all the source data files that you can use to compute sound.

Load Index File...

opens the **Select File** dialog box, in which you can select the index file for your computation.

Write

writes the sound pressure data. This button will appear only when **Write Acoustic Signals** is selected under **Options**.

Compute/Write

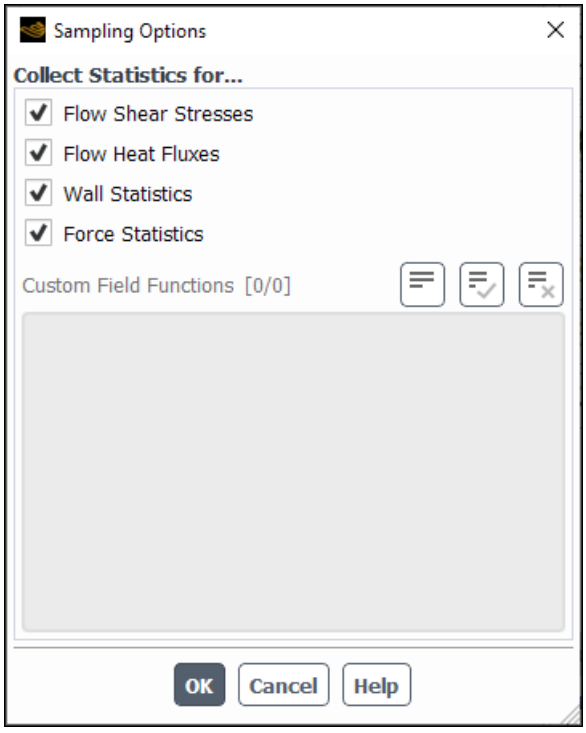
computes and saves the sound pressure data. This button will appear only when **Read Unsteady Acoustic Source Data Files** is selected under **Options**.

Receivers...(button)

opens the Acoustic Receivers Dialog Box (p. 4814) in which you can define additional receivers.

50.16.7. Sampling Options Dialog Box

The **Sampling Options** dialog box allows you to specify a collection of statistics for: **Flow Shear Stresses**, **Flow Heat Fluxes**, **Wall Statistics**, **DPM Variables**, and **Custom Field Functions**.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Collect Statistics for...

contains options for the variables you want to be able to postprocess.

Flow Shear Stresses

allows you to enable or disable the flow shear stress statistics for postprocessing.

Flow Heat Fluxes

allows you to enable or disable the flow heat fluxes statistics for postprocessing.

Wall Statistics

allows you to enable or disable the wall statistics for postprocessing.

Force Statistics

allows you to enable or disable the force statistics for postprocessing using cumulative plots (Cumulative Force, Moment, and Coefficients Plots (p. 4061)).

DPM Variables

allows you to enable or disable DPM variable statistics for postprocessing.

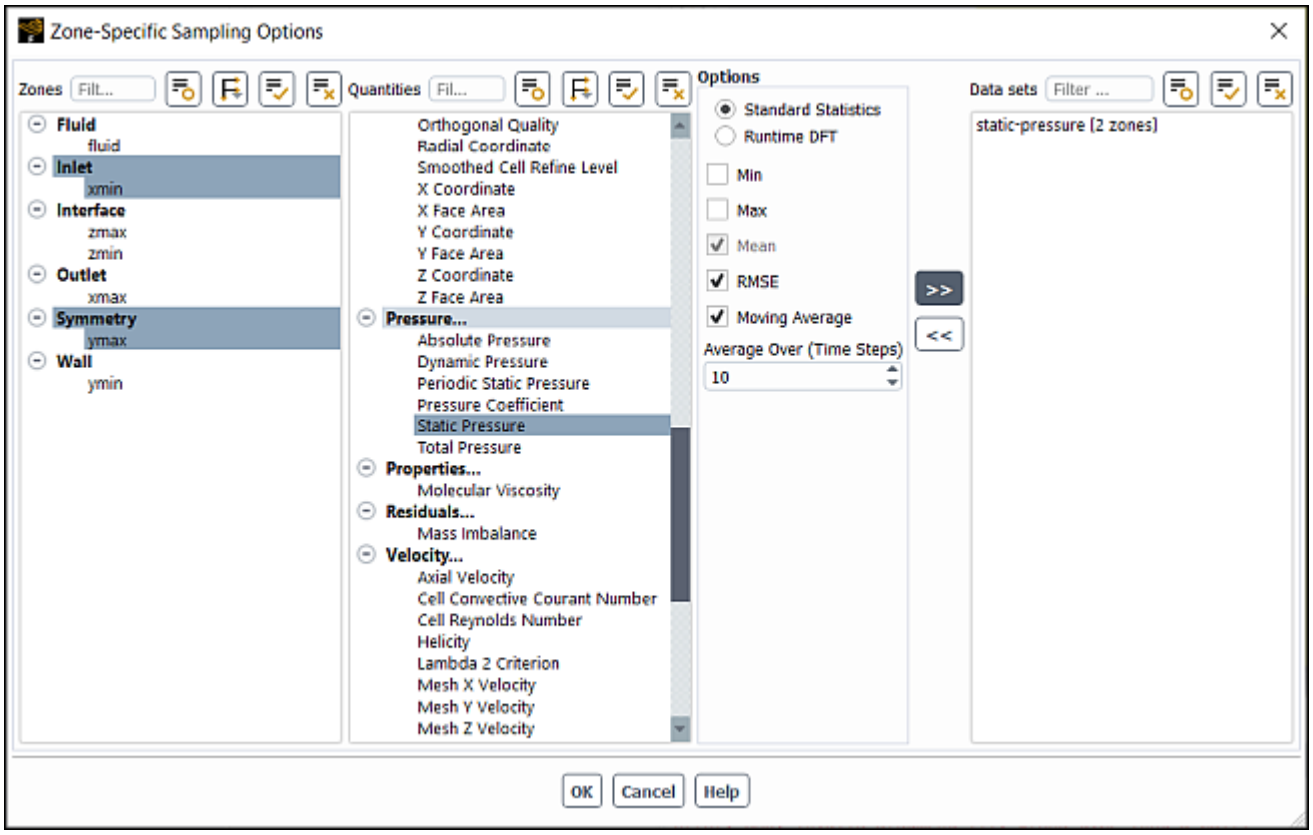
Custom Field Functions

allows you to select the previously defined custom field functions you want to be able to postprocess.

50.16.8. Zone-Specific Sampling Options Dialog Box

The **Zone-Specific Sampling Options** dialog box allows you to specify which statistics are collected and where they are collected. Refer to Inputs for Time-Dependent Problems (p. 3631) and Data Sampling for Steady Statistics (p. 3627) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zones

lists the available locations where statistics can be collected.

Quantities

allows you to specify which statistics are collected on the selected zone(s).

Min

allows you to specify that the minimum value of the selected quantity(s) will be collected.

Max

allows you to specify that the maximum value of the selected quantity(s) will be collected.

Mean

shows that the average value of the selected quantity(s) will be computed and collected (this option is always enabled).

RMSE

allows you to specify that the root mean square error of the selected quantity(s) will be computed and collected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Moving Average

allows you to specify an interval for averaging of the computed statistics.

Average Over

specifies the number of iterations (steady simulations) or time steps (transient simulations) that will be used for computing the moving average.

Important:

If you want to change the **Average Over** value for a dataset, you must remove it from the **Data sets** list (<<) and re-add the same zones and quantities with the new **Average Over** value.

Runtime DFT

allows you to specify that the runtime discrete Fourier transform of the selected quantity(s) will be computed and collected.

Add

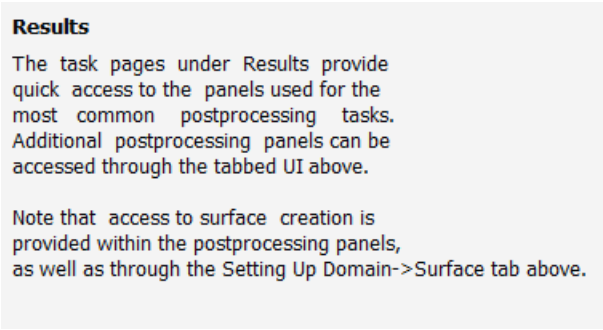
clicking >> allows you to specify which statistics are collected on the selected zone(s).

Remove

clicking << removes the selected **Data Sets**.

50.17. Results Task Page

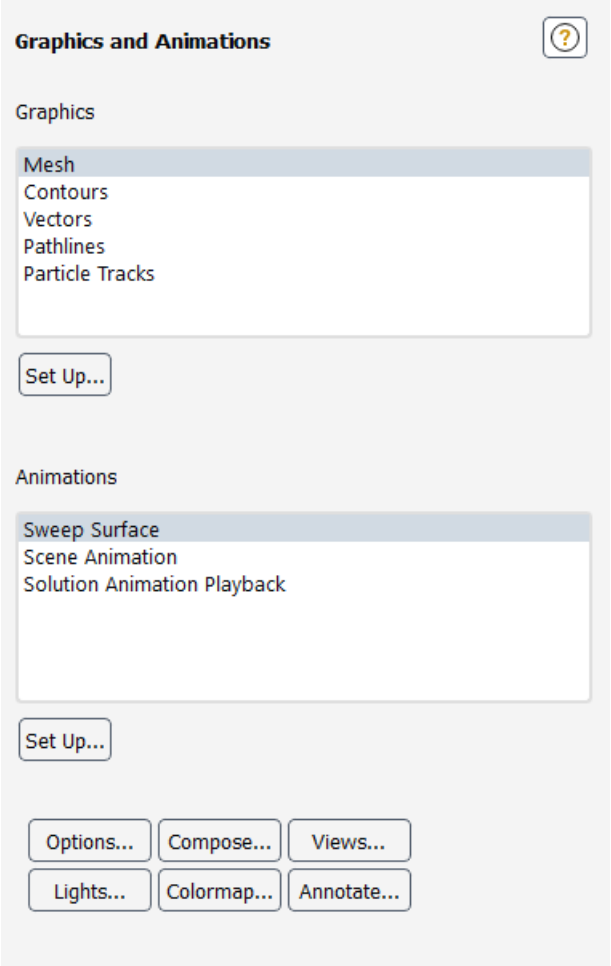
The **Results** task page introduces you to the main tasks involved in setting up and displaying the results of your CFD simulation using Ansys Fluent.



50.18. Graphics and Animations Task Page

The **Graphics and Animation** task page allows you to visualize the results of your CFD simulation by allowing you to set up plots of contours, vectors, pathlines, particle tracks, scene descriptions and animations. See Displaying Graphics (p. 3847) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Graphics

displays a list of the available graphics objects.

You can double-click an item in the **Graphics** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Mesh

- selecting this item and clicking the **Set Up...** button opens the Mesh Display Dialog Box (p. 4636).

Contours

- selecting this item and clicking the **Set Up...** button opens the Contours Dialog Box (p. 5357).

Vectors

- selecting this item and clicking the **Set Up...** button opens the Vectors Dialog Box (p. 5597).

Pathlines

- selecting this item and clicking the **Set Up...** button opens the Pathlines Dialog Box (p. 5515).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Particle Tracks

- selecting this item and clicking the **Set Up...** button opens the Particle Tracks Dialog Box (p. 5501).

Set Up...

opens the dialog box corresponding to the selected object in the **Graphics** list.

Animations

displays a list of the available animation objects.

You can double-click an item in the **Animations** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Sweep Surface

- selecting this item and clicking the **Set Up...** button opens the Sweep Surface Dialog Box (p. 5196).

Scene Animation

- selecting this item and clicking the **Set Up...** button opens the Animate Dialog Box (p. 5197).

Solution Animation

- selecting this item and clicking the **Set Up...** button opens the Playback Dialog Box (p. 5203).

Set Up...

opens the dialog box corresponding to the selected object in the **Animations** list.

Options...

opens the Display Options Dialog Box (p. 5208).

Scene...

opens the Scene Description Dialog Box (p. 5211).

Views...

opens the Views Dialog Box (p. 5218).

Lights...

opens the Lights Dialog Box (p. 5225).

Colormap...

opens the Colormap Dialog Box (p. 5226).

Annotate...

opens the Annotate Dialog Box (p. 5232).

For additional information, see the following sections:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.18.1. Profile Options Dialog Box
50.18.2. Vector Options Dialog Box
50.18.3. Custom Vectors Dialog Box
50.18.4. Vector Definitions Dialog Box
50.18.5. Path Style Attributes Dialog Box
50.18.6. Ribbon Attributes Dialog Box

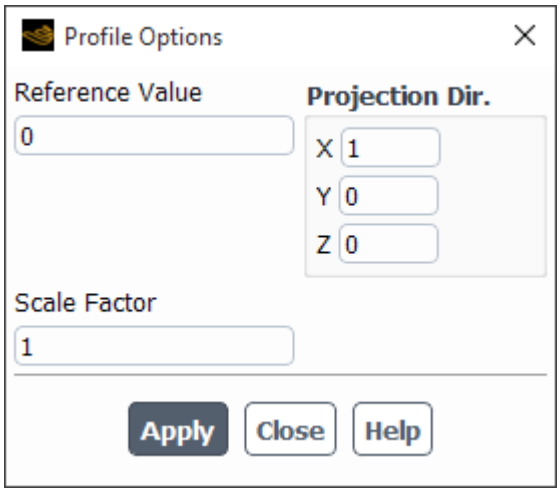
50.18.25. Bounding Frame Dialog Box
50.18.26. Views Dialog Box
50.18.27. Write Views Dialog Box
50.18.28. Mirror Planes Dialog Box
50.18.29. Periodic Instancing Dialog Box
50.18.30. Camera Parameters Dialog Box
50.18.31. Lights Dialog Box
50.18.32. Colormap Dialog Box
50.18.33. Colormap Editor Dialog Box
50.18.34. Annotate Dialog Box

50.18.1. Profile Options Dialog Box

The **Profile Options** dialog box controls the scaling and projection direction of profiles. It is opened from the Contours Dialog Box (p. 5357), and you will display the profiles using the **Display** button in that dialog box. See Displaying Contours and Profiles (p. 3874) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reference Value

sets the "zero height" reference value for the profile. Any point on the profile with a value equal to the **Reference Value** will be plotted exactly on the defining surface. Values greater than the **Reference Value** will be projected ahead of the surface (in the direction of **Projection Dir.** and scaled by **Scale Factor**), and values less than the **Reference Value** will be projected behind the surface.

Scale Factor

sets the length scale factor for projection. After subtracting off the **Reference Value**, Ansys Fluent multiplies the resulting solution value by the **Scale Factor** to form a length.

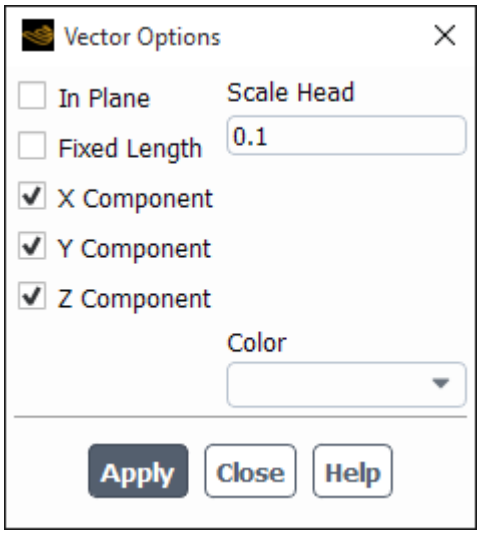
Projection Dir.

sets the direction in which profiles are projected. In 2D, for example, a contour plot of pressure on the entire domain can be projected in the z direction to form a carpet plot, or a contour plot of x velocity on a sequence of x-coordinate slice lines can be projected in the x direction to form a series of velocity profiles.

50.18.2. Vector Options Dialog Box

The **Vector Options** dialog box allows you to set additional parameters for vector displays. It is opened from the Vectors Dialog Box (p. 5597). See Vector Plot Options (p. 3888) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

In Plane

toggles the display of vector components in the plane of the surface selected for display. This feature is useful for visualizing components that are normal to the flow. See Drawing Vectors in the Plane of the Surface (p. 3890) for details.

Fixed Length

enables the display of vectors that are all the same length. See Displaying Fixed-Length Vectors (p. 3890) for details.

X, Y, Z Component

toggle the display of the Cartesian components of the vectors. See Displaying Vector Components (p. 3890) for details.

Scale Head

controls the size of the arrowhead on vector styles that include heads.

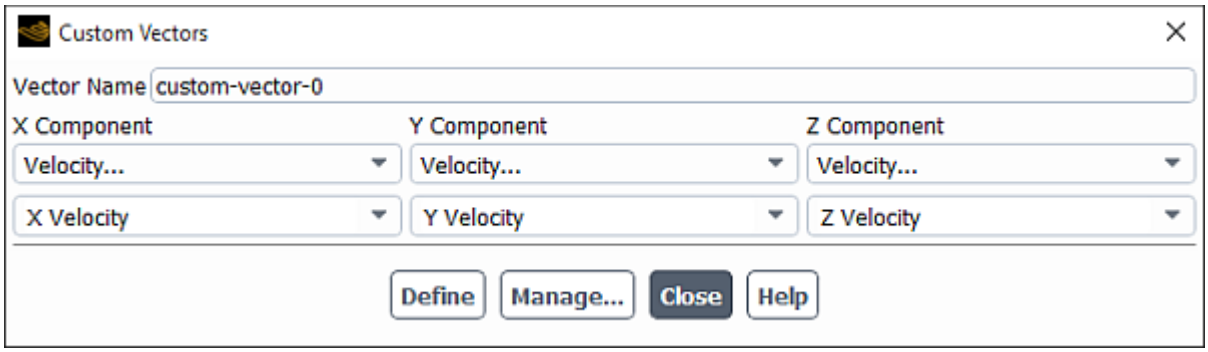
Color

specifies a single color for the display of all vectors. See Displaying Vectors Using a Single Color (p. 3891) for details.

50.18.3. Custom Vectors Dialog Box

The **Custom Vectors** dialog box allows you to define custom vectors based on existing quantities. Any vectors that you define will be added to the **Vectors of** list in the Vectors Dialog Box (p. 5597). To open the **Custom Vectors** dialog box, click **Custom Vectors...** in the **Vectors** dialog box. See Creating and Managing Custom Vectors (p. 3892) for details about custom vectors.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Vector Name

specifies the name of the vector you are defining. Should you decide to change the name after you have defined the vector, you can do so in the Vector Definitions Dialog Box (p. 5187), which you can open by clicking on the **Manage...** button.

X, Y, Z Component

specify the x, y, and z components of the vector. Each drop-down list contains the available field functions.

Define

creates the vector and adds it to the **Vectors of** list in the Vectors Dialog Box (p. 5597).

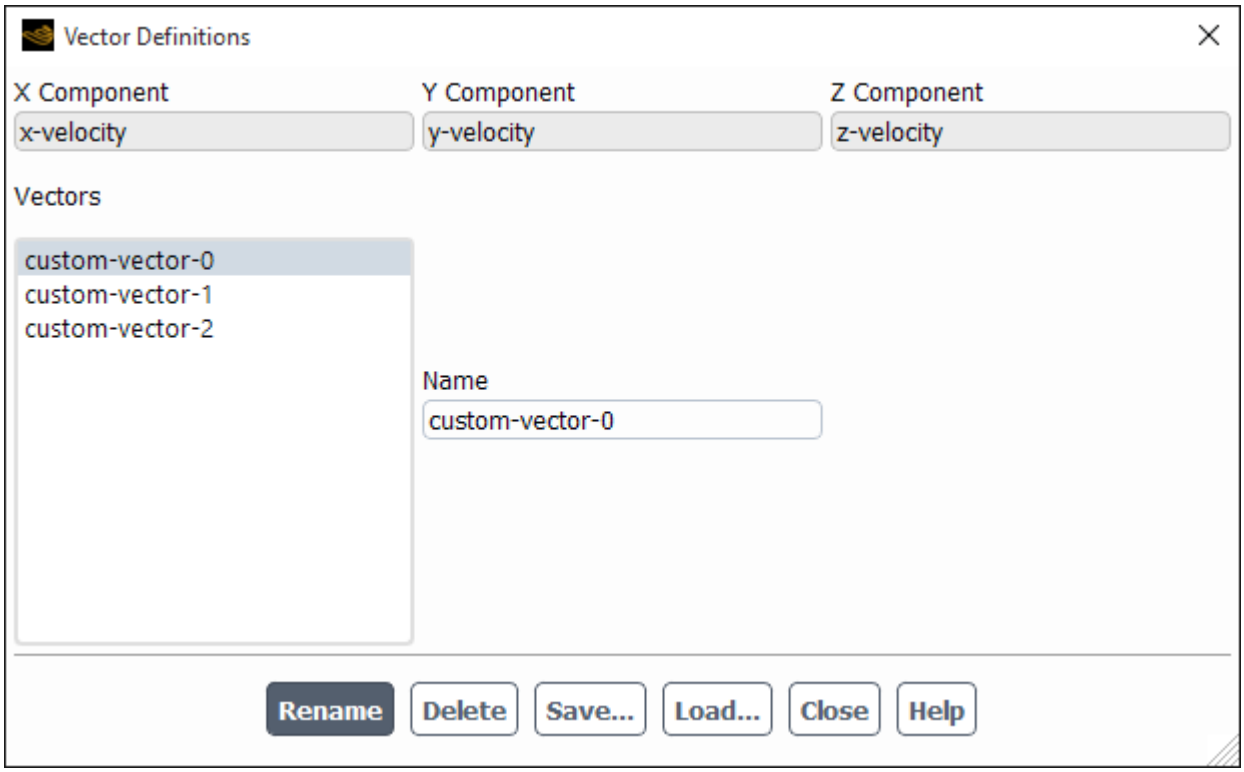
Manage...

opens the Vector Definitions Dialog Box (p. 5187), which enables you to check, rename, save, load, and delete custom vectors.

50.18.4. Vector Definitions Dialog Box

The **Vector Definitions** dialog box allows you to check, rename, save, load, and delete custom vectors that you defined in the Custom Vectors Dialog Box (p. 5186). See Creating and Managing Custom Vectors (p. 3892) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

X, Y, Z Component

display the x, y, and z components of the vector.

Vectors

contains a selectable list of custom vectors. When you select a vector, its components will appear in the **X**, **Y**, and **Z Component** fields, and its name will appear in the **Name** field.

Name

displays the name of the currently selected vector. You can enter a new name in this box if you want to rename the vector.

Rename

changes the name of the selected function to the name specified in the **Name** field.

Delete

deletes the selected vector.

Save...

opens The Select File Dialog Box (p. 907), in which you can specify a file in which to save all of the custom vectors in the **Vectors** list.

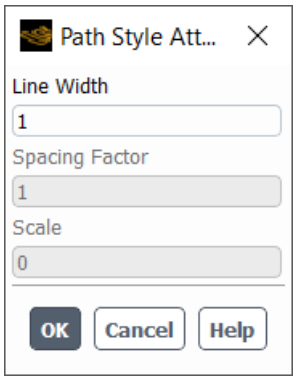
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Load...

opens the **Select File** dialog box, in which you can specify a file from which to read custom vectors (a file that you saved using the **Save...** button above).

50.18.5. Path Style Attributes Dialog Box

To modify the line width, cylinder radius or marker size, use the **Path Style Attributes** dialog box. You can open this dialog box by clicking the **Attributes...** button in the Pathlines Dialog Box (p. 5515). See Controlling the Pathline Style (p. 3898) for details about the items below.



Controls

Line Width/Marker Size/Width

determines the thickness of the pathlines.

Diameter

specifies the diameter of the sphere. This parameter appears only when **sphere** is selected under **Style** in the **Pathlines** dialog box.

Spacing Factor

controls the spacing of arrows when you use the **line-arrows** style.

Scale

controls the size of the arrow heads when you use the **line-arrows** style.

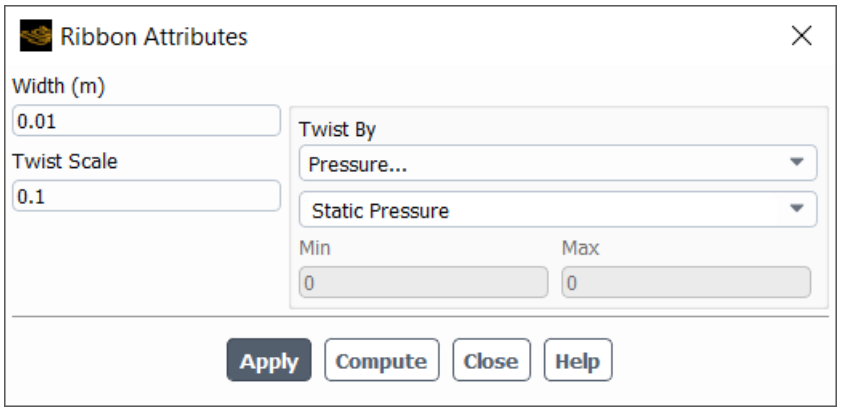
Detail

specifies the detail applied to the graphical rendering of the spheres. This parameter appears only when **sphere** is selected under **Style** in the **Pathlines** dialog box.

50.18.6. Ribbon Attributes Dialog Box

To modify the ribbon width and set the scalar field by which to twist the ribbon, use the **Ribbon Attributes** dialog box. You can open this dialog box by clicking the **Attributes...** button in the Pathlines Dialog Box (p. 5515) when the selected **Style** is ribbon. See Controlling the Pathline Style (p. 3898) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Width

determines the thickness of the ribbon.

Twist Scale

sets the amount of twist for a given field. To magnify the twist for a field with very little change, increase this factor; to display less twist for a field with dramatic changes, decrease this factor.

Twist By

contains a drop-down list from which you can select a scalar field on which pathline twisting is based.

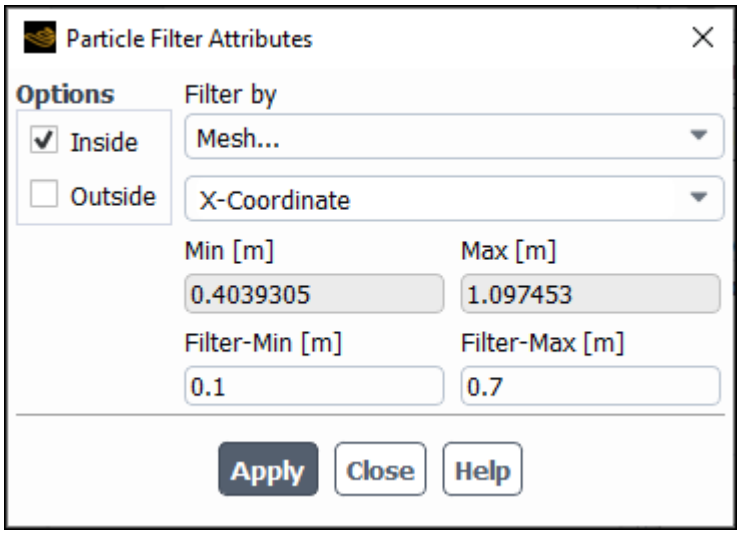
Min/Max

displays the minimum/maximum value of the scalar field selected in **Twist By**.

50.18.7. Particle Filter Attributes Dialog Box

The **Particle Filter Attributes** dialog box allows you to specify how you would like to filter the particles being displayed. This dialog box opens when you click **Filter by...** in Particle Tracks Dialog Box (p. 5501). See Particle Filtering (p. 2842) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the filtering options.

Inside

enables the filtering of particles with values between **Filter-Min** and **Filter-Max**.

Outside

enables the filtering of particles with values less than **Filter-Min** or greater than **Filter-Max**.

Filter by

contains a list from which you can select any field variable, except for **Custom Field Functions...**, to be used as a filter variable.

Min/Max

displays the minimum and maximum values of the selected field variable. The real number field values are not editable; they are purely informational.

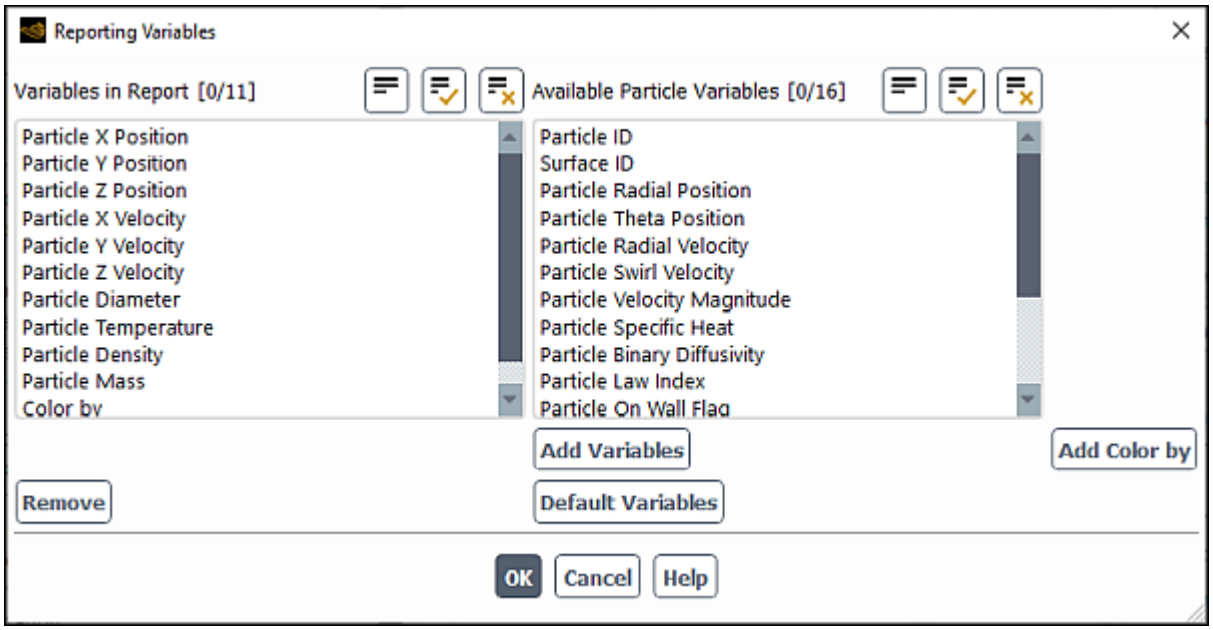
Filter-Min/Filter-Max

defines the minimum/maximum filter threshold.

50.18.8. Reporting Variables Dialog Box

The **Reporting Variables** dialog box allows you to control the particle variables that you include in your reporting. See Step-by-Step Reporting of Trajectories (p. 2852) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Variables in Report

contains all variables currently in the report.

Remove

removes the selected variable from the report.

Default Variables

restores the default list.

Available Particle Variables

contains the particle variables that are available for you to select.

Add Variables

takes the selected variable from the **Available Particle Variables** list and adds it to the **Variables in Report** list.

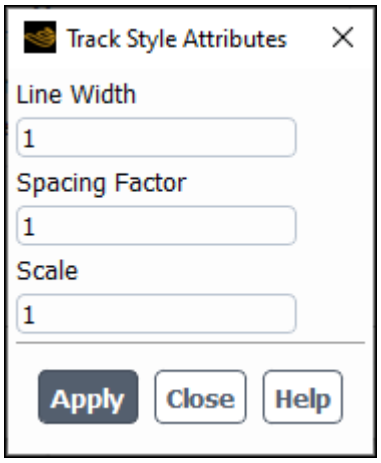
Add Color By

adds the **Color by** variable to the **Variables in Report** list.

50.18.9. Track Style Attributes Dialog Box

To modify the line width, cylinder radius or marker size, use the **Track Style Attributes** dialog box. You can open this dialog box by clicking the **Attributes...** button in the Particle Tracks Dialog Box (p. 5501). See Controlling the Particle Tracking Style (p. 2835) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Line Width/Marker Size/Width

determines the thickness of the particle tracks.

Spacing Factor

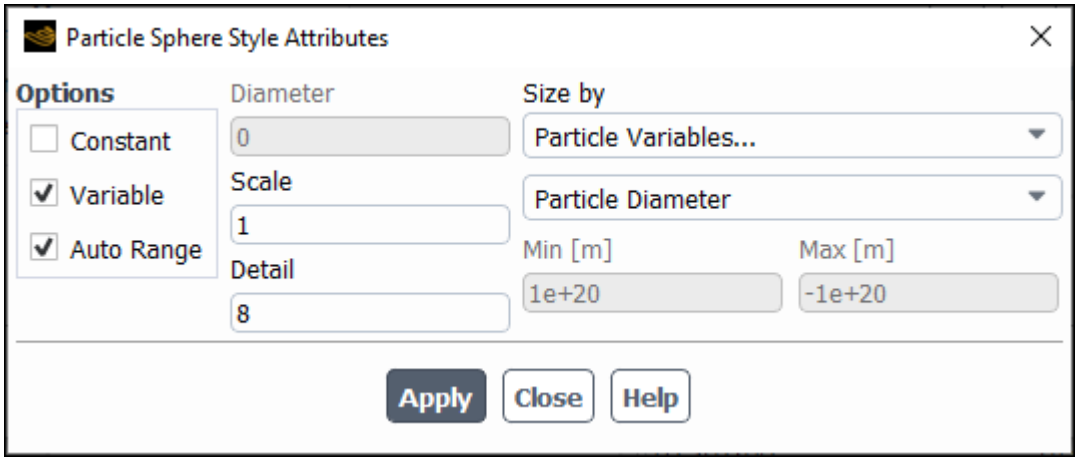
controls the spacing of arrows when you use the **line-arrows** style.

Scale

controls the size of the arrow heads when you use the **line-arrows** style.

50.18.10. Particle Sphere Style Attributes Dialog Box

To modify the attributes of the particle sphere, use the **Particle Sphere Style Attributes** dialog box. Select **sphere** from the **Track Style** drop-down list and click the **Attributes...** button in the Particle Tracks Dialog Box (p. 5501) to open the **Particle Sphere Style Attributes** dialog box. See Controlling the Particle Tracking Style (p. 2835) for details about the items below.



Controls

Options

allows you to choose how you would like to specify the particle diameter.

Constant

allows you to specify the diameter as a constant value.

Variable

allows you to select a particle variable to estimate the size of the spheres.

Auto Range

when disabled clips the displayed particles to the values given in **Min** and **Max**.

Diameter

specifies the diameter of the sphere.

Scale

allows you to scale the spheres by the factor entered in this field.

Detail

specifies the detail applied to the graphical rendering of the spheres.

Size by

contains a list of variables by which you can estimate the size of your particle. This list is selectable only when you are using the **Variable** option.

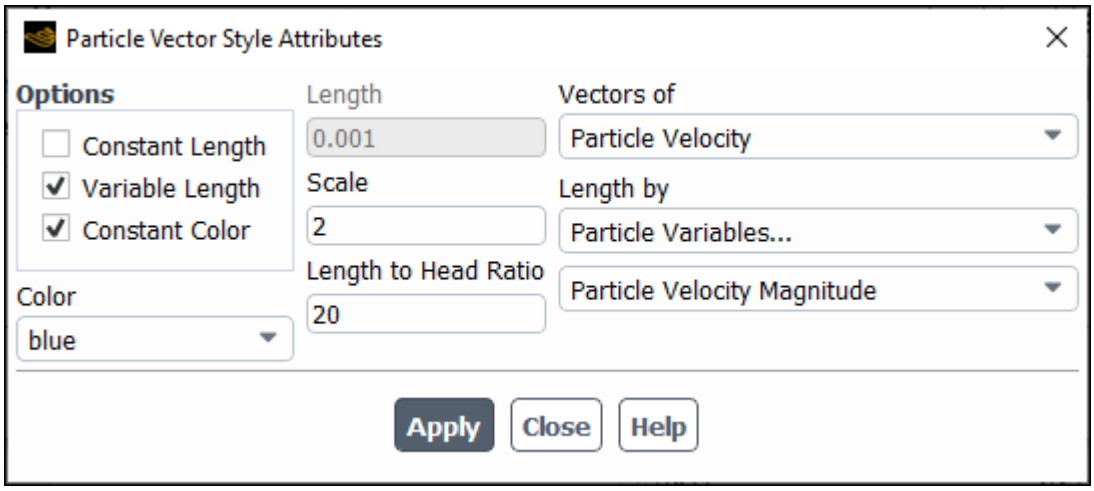
Min/Max

defines the minimum and maximum values of the selected field variable to display.

50.18.11. Particle Vector Style Attributes Dialog Box

To modify the attributes of the vector styles, use the **Particle Vector Style Attributes** dialog box. See Controlling the Vector Style of Particle Tracks (p. 2838) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

allows you to choose how you would like to specify the particle diameter.

Constant Length

allows you to specify the vector length as a constant value.

Variable Length

results in a vector length that is based on the variable selected under **Length by**.

Constant Color

when enabled allows you to select a vector color from the **Color** drop-down list. Otherwise, the vector is colored based on the variable selected in the **Particle Tracks** dialog box (seen in the **Mesh Colors** dialog box when **Draw Mesh** is enabled).

Length

specifies the length of the vector.

Scale

allows you to scale the vectors by the factor entered in this field.

Length to Head Ratio

is the ratio of vector length to vector head size.

Vectors of

contains the particle vector variable to display.

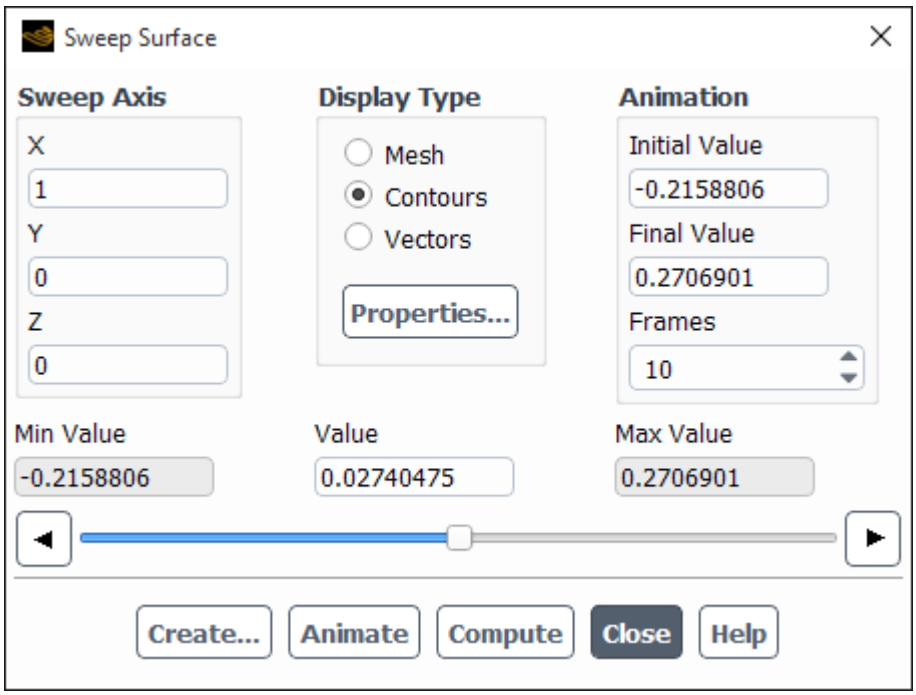
Length by

is used to estimate the length of the vector when the **Variable Length** option is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.18.12. Sweep Surface Dialog Box

The **Sweep Surface** dialog box controls the display and animation of mesh, contour, and vector plots generated on a sweep surface. See Displaying Results on a Sweep Surface (p. 3910) for details about the items below.



Controls

Sweep Axis

specifies the (**X**, **Y**, **Z**) vector representing the axis along which the surface should be swept.

Display Type

specifies the type of display to be swept through the domain (**Mesh**, **Contours**, or **Vectors**).

Properties...

opens the Contours Dialog Box (p. 5357) if **Contours** is the selected **Display Type**, or the Vectors Dialog Box (p. 5597) if **Vectors** is the selected **Display Type**. (This button is not available if **Mesh** is the selected **Display Type**.)

Animation

contains controls for animating the sweep-surface display.

Initial Value, Final Value

specify the initial and final positions for the animation.

Frames

specifies the number of frames in the animation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min Value, Max Value

show the minimum and maximum extents of the domain along the specified **Sweep Axis**. These values are updated when you click **Compute**.

Value

shows the current position at which the requested display is plotted. You can change the value by moving the slide bar below it, or by entering a new value and pressing the <RETURN> key.

Create...

opens the Create Surface Dialog Box (p. 5197), where you can create a surface from the currently-displayed sweep surface.

Animate

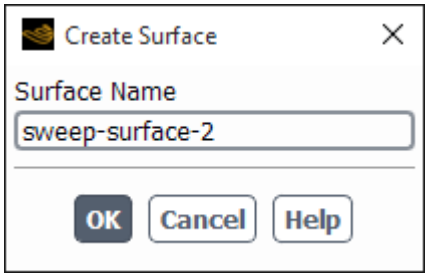
animates the display, sweeping the requested display through the domain along the specified axis.

Compute

updates the **Min Value** and **Max Value** to reflect the minimum and maximum extents of the domain along the specified **Sweep Axis**.

50.18.13. Create Surface Dialog Box

The **Create Surface** dialog box allows you to save a sweep surface for later use. You can open it by clicking **Create...** in the Sweep Surface Dialog Box (p. 5196). See Displaying Results on a Sweep Surface (p. 3910) for details about the items below.



Controls

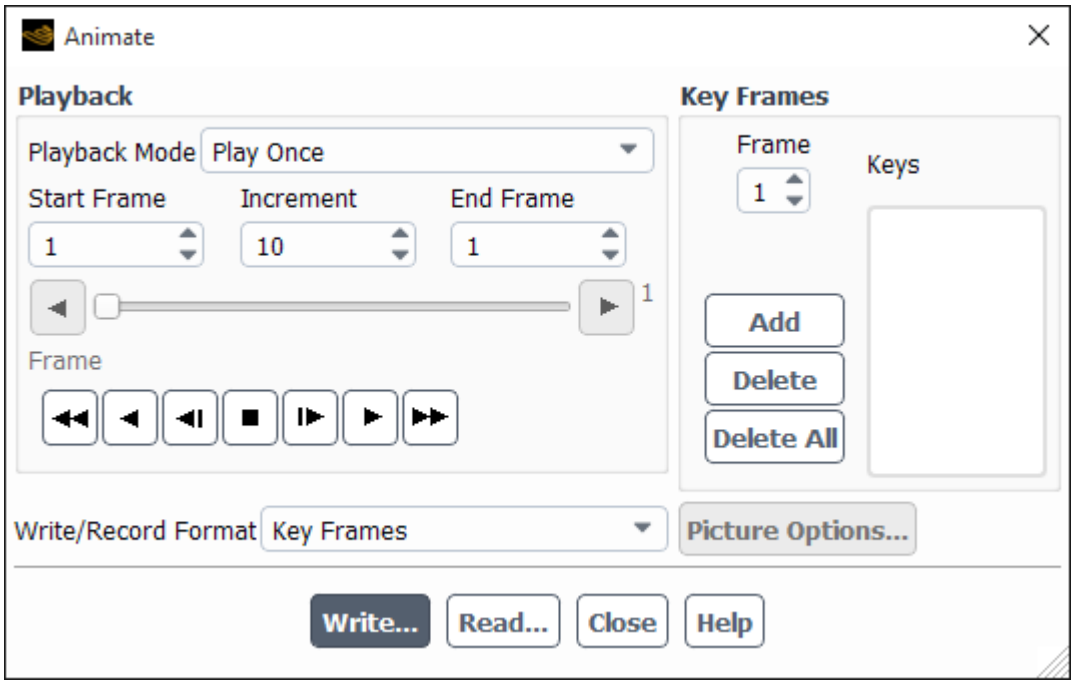
Surface Name

specifies a name for the surface to be created.

50.18.14. Animate Dialog Box

The **Animate** dialog box allows you to specify key frames that define the basic movement of an animated sequence, and then play back the animation. Ansys Fluent interpolates between your specified key frames. See Animating Graphics (p. 4018) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Playback

contains the controls that you use to play back the animation. See Playing an Animation (p. 4021) for details.

Playback Mode

contains a drop-down list of playback options.

Play Once

sets the option to play back frames from **Start Frame** to **End Frame** once.

Auto Repeat

sets the option to continually play back frames from **Start Frame** to **End Frame**.

Auto Reverse

sets the option to continually play back the images while reversing playback direction after each set.

Start Frame, End Frame

set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

Increment

sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frame

shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.

(Tape Player Buttons)

allow you to play the animation forward and backward, fast-reverse and fast-forward the animation, and stop it. The buttons function in a way similar to those on a standard video cassette player.

Key Frames

contains the controls that you use to define the key frames for the animation. See Creating an Animation (p. 4020) for details.

Frame

sets the number to be assigned to the next key frame added to the list of **Keys**.

Keys

contains a list of the key frames that have been defined. If you select a key frame in this list, the associated scene will be displayed in the graphics window.

Add

creates a key frame with the number shown in **Frame** for the scene currently displayed in the graphics window.

Important:

Be sure to change the frame number before you add the new key frame so that you will not overwrite the last key frame that you created.

Delete

deletes the key frame that is selected in the **Keys** list.

Delete All

deletes all key frames in the **Keys** list.

Write/Record Format

specifies **Key Frames**, **Picture Files**, **MPEG**, or **Video** (not available on Windows) as the format in which to save the animation. See Saving an Animation (p. 4022) for details about these options.

Picture Options...

opens the Save Picture Dialog Box (p. 5200), in which you can specify parameters for saving the animation to picture files. This button is available only when **Picture Files** is selected as the **Write/Record Format**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Write...

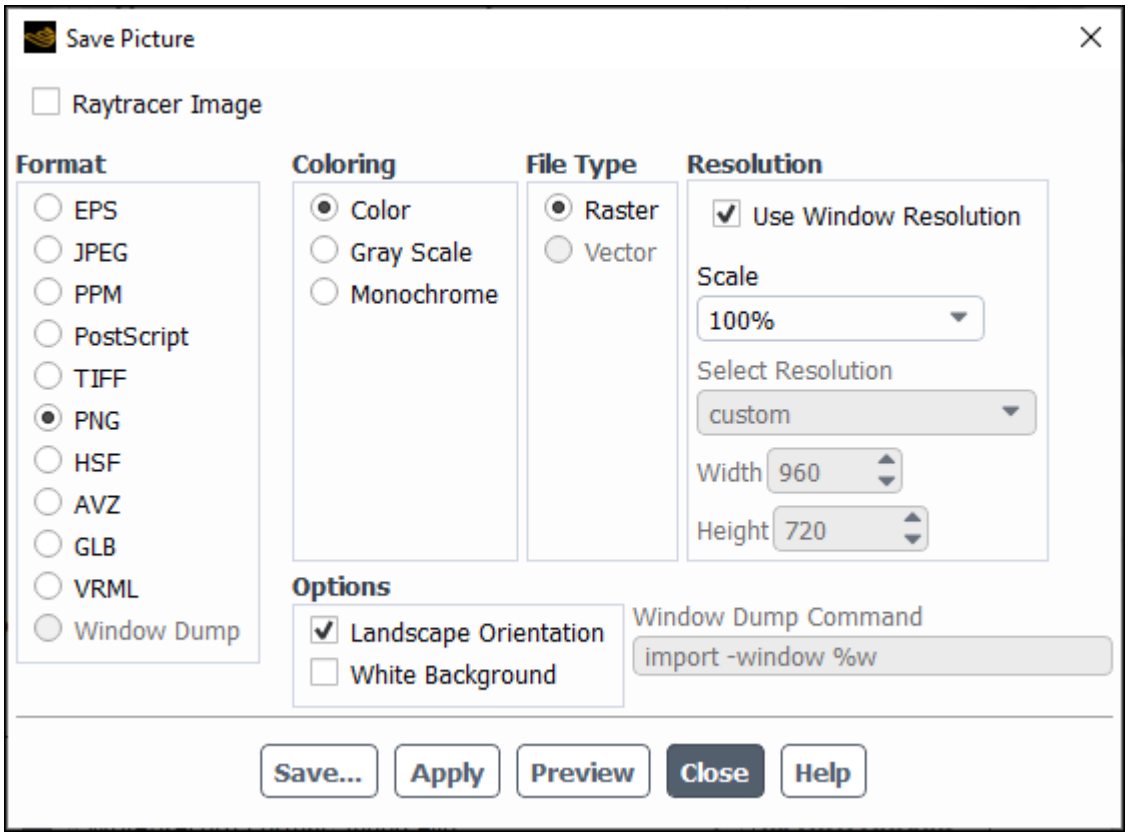
opens The Select File Dialog Box (p. 907), in which you can specify a name for the animation file and save it.

Read...

opens the **Select File** dialog box, in which you can specify the name of the animation file to be read. Note that the current case and data should contain the surfaces and any other information that the key frame description refers to. See Reading an Animation File (p. 4023).

50.18.15. Save Picture Dialog Box

The **Save Picture** dialog box allows you to set save picture parameters and save picture files of graphics windows. See Saving Picture Files (p. 994) for details on the use of this dialog box.



Controls

Raytracer Image

Saves the current image using a raytracing renderer for enhanced image quality. Refer to Realistic Rendering Using Raytracing (p. 3965) for additional information on raytracing.

Format

allows you to select the format of picture files.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EPS

(Encapsulated PostScript) output is the same as PostScript output, with the addition of Adobe Document Structuring Conventions (v2) statements. Currently, no preview bitmap is included in EPS output. Often, programs that import EPS files use the preview bitmap to display on-screen, although the actual vector PostScript information is used for printing (on a PostScript device). You can save EPS files in raster or vector format.

JPEG

is a common raster file format.

PPM

output is a common raster file format.

PostScript

is a common vector file format. You can also choose to save a PostScript file in raster format.

TIFF

is a common raster file format.

PNG

is a common raster file format.

HSF

is HOOPS Visualize Stream Format, a highly-compressible and streamable 2D/3D file format.

AVZ

is the free Ansys Viewer Format, which is a 3D file format allowing you to visualize, share, collaborate, and interactively manipulate the displayed object. For additional information on the Ansys Viewer, refer to Ansys Viewer User's Guide.

GLB

is a 3D file format frequently used in virtual reality (VR) and augmented reality (AR) applications. The file size is relatively small as it is a binary format of glTF.

VRML

is a graphics interchange format that allows export of 3D geometrical entities that you can display in the Ansys Fluent graphics window. This format can commonly be used by VR systems and in particular the 3D geometry can be viewed and manipulated in a web-browser graphics window.

Important:

Non-geometric entities such as text, titles, color bars, and orientation axis are not exported. In addition, most display or visibility characteristics set in Ansys Fluent,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

such as lighting, shading method, transparency, face and edge visibility, and outer face culling, are not explicitly exported but are controlled by the software used to view the VRML file.

Window Dump

(Linux systems only) selects a window dump operation for generating the picture. With this format, you will need to specify the appropriate **Window Dump Command**.

Coloring

(all formats except **Window Dump**) specifies the color mode for the picture file.

Color

specifies a color-scale copy.

Gray Scale

specifies a gray-scale copy.

Monochrome

specifies a black-and-white copy.

Important:

Most monochrome PostScript devices will render **Color** images in shades of gray, but to ensure that the color ramp is rendered as a linearly-increasing gray ramp, you should select **Gray Scale**.

File Type

specifies the type of picture file to be saved. See Choosing the File Type (p. 999) for details.

Raster

specifies a raster type picture. The supported raster formats are **EPS**, **JPEG**, **PPM**, **PostScript**, **TIFF**, and **PNG**.

Vector

specifies a vector type picture. The supported vector formats are **EPS**, **PostScript**, and **VRML**.

Resolution

specifies the resolution or the size (in pixels) of the picture.

Use Window Resolution

uses the resolution of the current graphics window when the image is saved.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DPI

specifies the resolution of **EPS** and **PostScript** files in dots per inch (DPI). The default value for **DPI** is set to 75.

Width

specifies the width of the raster picture image.

Height

specifies the height of the raster picture image.

*The default value for **Width** and **Height** is set to zero, so that the default picture is generated at the same resolution as the active graphics window.*

Options

contains additional options for all picture formats except **Window Dump**.

Landscape Orientation

specifies the orientation of the picture. If this option is enabled, the picture is made in landscape mode; otherwise, it is made in portrait mode.

White Background

controls the foreground/background color. If this option is enabled, the picture is saved with a white background and, for 2D plots, the axes and labels are saved in black.

Window Dump Command

(Linux systems only) specifies the command to be used to save the picture file, when you select the **Window Dump** format. See Window Dumps (Linux Systems Only) (p. 1000) for details.

Save...

opens The Select File Dialog Box (p. 907), in which you can specify a name for the picture file to be saved and then save the file. The resulting file will contain a picture of the active graphics window.

Apply

saves the current settings. Ansys Fluent will use these settings when making subsequent pictures.

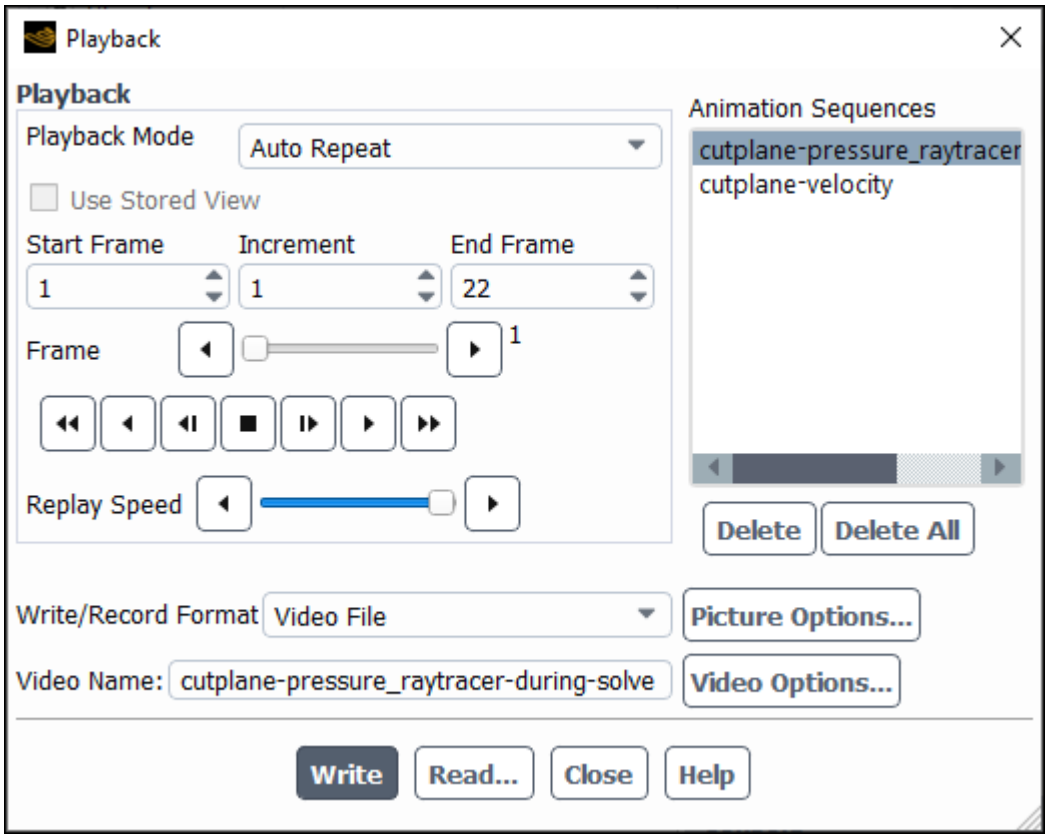
Preview

applies the current settings to the active graphics window so that you can investigate the effects of different options interactively before saving the final picture.

50.18.16. Playback Dialog Box

The **Playback** dialog box allows you to play back an animation sequence. See Playing an Animation Sequence (p. 3703) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Playback

contains the controls that you use to play back the selected animation sequence.

Playback Mode

contains a drop-down list of playback options.

Play Once

sets the option to play back frames from **Start Frame** to **End Frame** once.

Auto Repeat

sets the option to continually play back frames from **Start Frame** to **End Frame**.

Auto Reverse

sets the option to continually play back the images while reversing playback direction after each set.

Use Stored View

disabling allows you to modify the view during animation playback (**In Memory** and **HSF File** 3D animations only).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Start Frame, End Frame

set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

Increment

sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

Frame

shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.

(Tape Player Buttons)

allow you to play the animation forward and backward, fast-reverse and fast-forward the animation, and stop it. The buttons function in a way similar to those on a standard video cassette player.

Replay Speed

controls the playback speed for the animation. Move the **Replay Speed** slider bar to the left to reduce the playback speed (and to the right to increase it).

Animation Sequences

contains the controls that you use to define the sequence to be played back.

Sequences

contains a list of the animation sequences that have been defined.

Delete

deletes the animation sequence that is selected in the **Sequences** list.

Delete All

deletes all animation sequences in the **Sequences** list.

Write/Record Format

specifies **Animation Frames**, **Picture Files**, or **Video File** as the format in which to save the animation. See Saving an Animation Sequence (p. 3706) for details about these options.

Picture Options...

opens the Save Picture Dialog Box (p. 5200) where you can specify parameters for saving the animation to picture files. This button is available only when **Picture Files** is selected as the **Write/Record Format**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Video Options...

opens the Video Options Dialog Box (p. 5206) where you can specify parameters for saving the animation to video files. This button is available only when **Video File** is selected as the **Write/Record Format**.

Video Name

is the name that the video file will be saved with. This field is available only when **Video File** is selected as the **Write/Record Format**.

Write

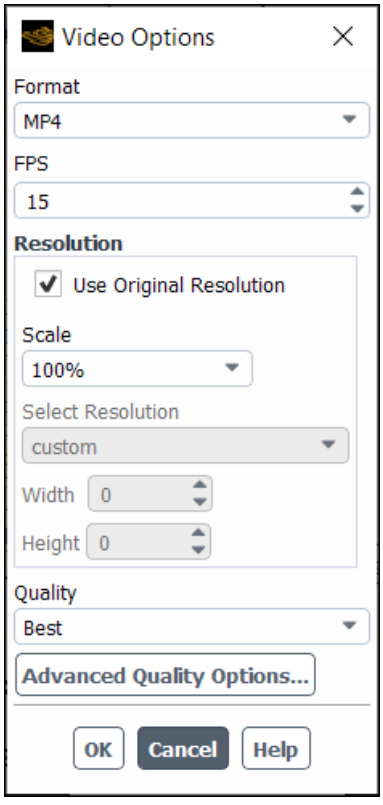
saves the specified file(s) in the current working directory in many cases. However, the animation may be written at the same location as the animation sequence file.

Read...

opens The Select File Dialog Box (p. 907), in which you can specify the name of the solution animation file to be read. See Reading an Animation Sequence (p. 3710) for details.

50.18.17. Video Options Dialog Box

The **Video Options** dialog box allows you control how an animation file is saved in video format. See Video File (p. 3708) for additional information.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Format

specifies the format of the saved video file.

FPS

specifies the target frames per second (FPS) for the saved video file.

Resolution

contains the settings that control the resolution of the saved video file.

Use Original Resolution

saves the video file in the same resolution as its comprising images (2D formats—ppm, png, jpeg, tiff) or using the current graphics window size (HSF, in-memory).

Scale

control the scale of the saved video file.

Select Resolution

contains common pre-defined video resolutions. *This option is only available when* ***Use Original Resolution*** *is disabled*.

Width

displays the width, in pixels, of the saved video file. *This option is only available and populated when* ***Use Original Resolution*** *is disabled*.

Height

displays the height, in pixels, of the saved video file. *This option is only available and populated when* ***Use Original Resolution*** *is disabled*.

Quality

specifies the quality of the saved video file *which may affect the final file size in addition to the video picture quality.*.

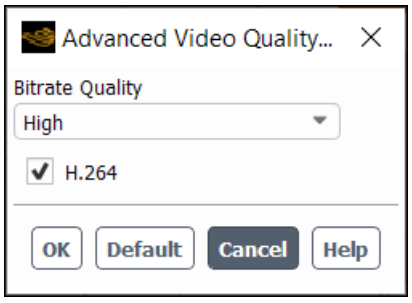
Advanced Quality Options...

opens the Advanced Video Quality Options Dialog Box (p. 5207) where you can access advanced controls for the video file quality.

50.18.18. Advanced Video Quality Options Dialog Box

The **Advanced Video Quality Options** dialog box allows you to control additional options for the quality of a saved animation video file. Refer to Video File (p. 3708) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Bitrate Quality

specifies the bitrate quality of the saved video file.

H.264

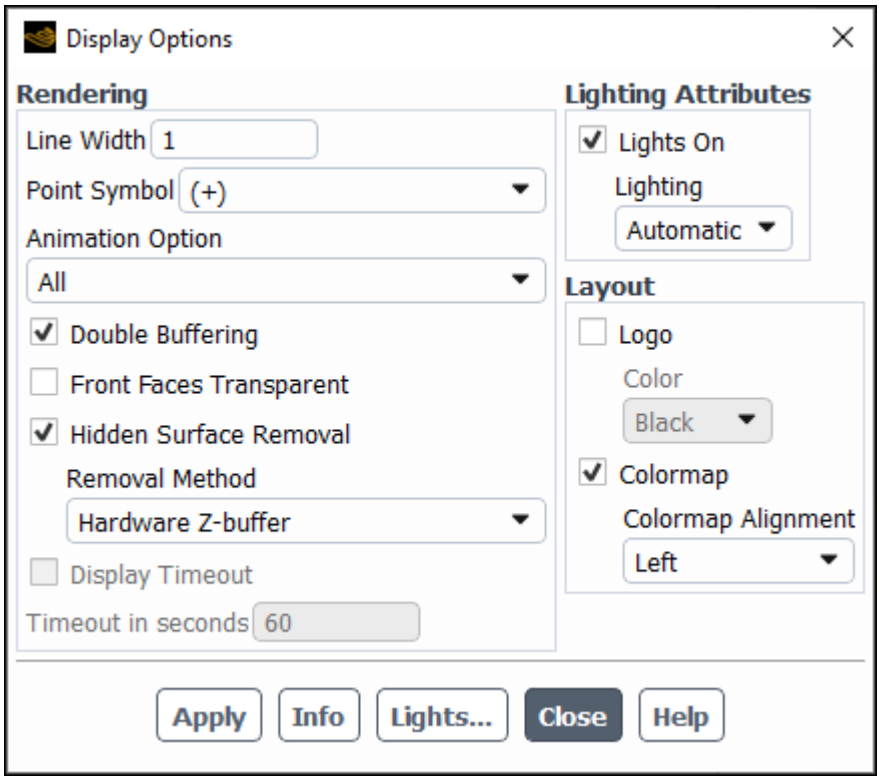
uses the H.264 compression technique when writing the video file.

Default

resets the fields to the default settings.

50.18.19. Display Options Dialog Box

The **Display Options** dialog box provides an interactive mechanism for setting attributes or options that control how and where a scene is rendered.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rendering

allows you to modify characteristics of the display that are related to the way in which scenes are rendered. See Modifying the Rendering Options (p. 3957) for details about these items.

Line Width

controls the thickness of lines. The default is 1.

Point Symbol

sets the symbol used for nodes and data points.

Animation Option

contains a drop-down list of animation options: **All** and **Wireframe**. **Wireframe** uses a wireframe representation of all geometry during mouse manipulation This option is turned on by default. You should turn it off only if your computer has a graphics accelerator; otherwise the mouse manipulation may be very slow.

Double Buffering

turns double buffering on or off, if it is supported by the driver. Double buffering dramatically reduces screen flicker during graphics updates. Note that if your display hardware does not support double buffering and you turn this option on, double buffering will be done in software. Software double buffering uses extra memory.

Front Faces Transparent

allows you to turn off the display of outer faces in wall zones. Making the **Front Faces Transparent** is useful for displaying both sides of a slit wall. By default, when you display a slit wall, one side will "bleed" through to the other. When you turn on the **Front Faces Transparent** option, the display of a slit wall will show each side distinctly as you rotate the display. This option can also be useful for displaying two-sided walls (walls with fluid or solid cells on both sides).

Hidden Surface Removal

turns hidden surface removal on or off. If you do not use hidden surface removal, Ansys Fluent will not try to determine which surfaces in the display are behind others; it will display all of them, and a cluttered display will result. You should turn this option off if you are working with a 2D problem or with geometries that do not overlap.

Removal Method

chooses the method to be used for hidden surface removal. These options vary in speed and quality, depending on the device you are using. The choices are listed below.

Hardware Z-buffer

is the fastest method if your hardware supports it. The accuracy and speed of this method is hardware dependent.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Painters

will show fewer edge-aliasing effects than hardware-z-buffer. This method is often used instead of software-z-buffer when memory is limited.

Software Z-buffer

is the fastest of the accurate software methods available (especially for complex scenes), but it is memory intensive.

Z-sort only

is a fast software method, but it is not as accurate as software-z-buffer.

Timeout in seconds

specifies the value for the timeout.

Lighting Attributes

controls lighting attributes for all lights in the active graphics window. See Adding Lights (p. 3954) for details.

Lights On

turns *all* lights in the active graphics window on or off.

Lighting

specifies the method to be used in lighting interpolation: **Automatic**, **Flat**, **Gouraud**, or **Phong**. **Automatic** automatically selects the best lighting method for the type of display in the graphics window. (**Flat** is the most basic method: there is no interpolation within the individual polygonal facets. **Gouraud** and **Phong** have smoother gradations of color because they interpolate on each facet.)

Layout

controls the display of captions, axes and the colormap in the graphics display window. See Changing the Legend Display (p. 3929) for details.

Logo

allows you to hide or display the ANSYS logo.

Color

contains a drop-down list of colors that can be used for the logo. The choices are **White** or **Black**.

Colormap

enables/disables the display of the color scale.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Colormap Alignment

allows you to adjust the alignment of colormap in the graphics display. Select the side (**Top**, **Bottom**, **Left**, and **Right**) from the drop-down list, where you want to align the colormap.

Apply

updates how new graphics objects will appear. Note that some changes, such as those to line width and the logo are updated in all applicable graphics windows once you click **Apply**.

Info

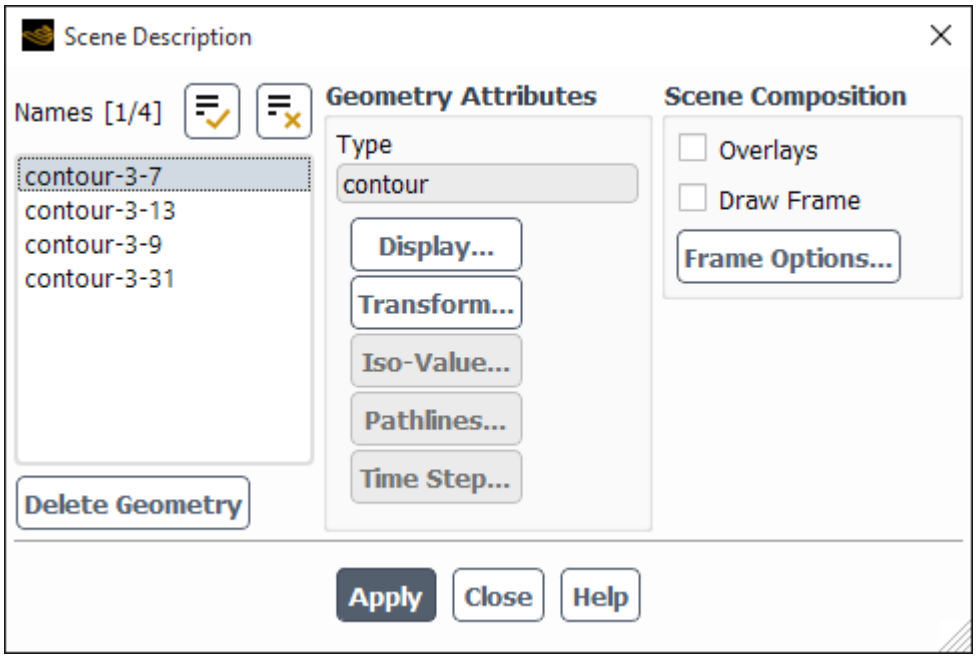
prints out information about your graphics driver in the console.

Lights...

opens the Lights Dialog Box (p. 5225), which allows you to create, delete, and modify directional light sources.

50.18.20. Scene Description Dialog Box

The **Scene Description** dialog box allows you to turn overlays on and off, select geometric objects in the display for modification or deletion, and open dialog boxes that control various characteristics of the selected object(s). (Note that you cannot use the **Scene Description** dialog box to control XY plot and histogram displays.) See Advanced Scene Composition (p. 4009) for details about the items below.



Controls

Names

contains a list of the geometric objects that currently exist in the scene (including those that are presently invisible). You can specify the object or objects to be manipulated by selecting names

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

in this list. If you select more than one object at a time, any operation (transformation, color specification, and so on) will apply to all the selected objects. You can also select objects by clicking on them in the graphics display using the mouse probe button, which is, by default, the right mouse button. (See Controlling the Mouse Button Functions (p. 3989) for information about mouse button functions.) To deselect a selected object, simply click its name in the **Names** list. See Selecting the Object(s) to be Manipulated (p. 4010) for details.

Geometry Attributes

contains information about the type of the selected geometric object and push buttons that open dialog boxes for modifying the object.

Type

reports the type of the selected object. Possible types include `mesh`, `surface`, `contour`, `vector`, and `Group`. This information is especially helpful when you need to distinguish two or more objects with the same name. When more than one object is selected, the type displayed is `Group`.

Display...

opens the Display Properties Dialog Box (p. 5213), which allows you to change the color, visibility, and other properties for the selected object.

Transform...

opens the Transformations Dialog Box (p. 5215), which allows you to translate, rotate, and scale the selected object.

Iso-Value...

opens the Iso-Value Dialog Box (p. 5216), which allows you to change the isovalue of an isosurface. This push button is available only if the geometric object selected in the **Names** list is an isosurface or an object on an isosurface (contour on an isosurface, for example); otherwise it is grayed out.

Pathlines...

opens the Pathline Attributes Dialog Box (p. 5217), which allows you to set the maximum number of steps for the selected pathlines.

Scene Composition

contains controls for enabling overlays and bounding frames.

Overlays

activates the superimposition of a new geometry onto a currently displayed geometry. See Advanced Graphics Overlays (p. 3924) for details.

Draw Frame

activates the display of a bounding frame in the graphics display. See Adding a Bounding Frame (p. 4016) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frame Options...

opens the Bounding Frame Dialog Box (p. 5217), in which you can define properties of the bounding frame. See Adding a Bounding Frame (p. 4016) for details.

Delete Geometry

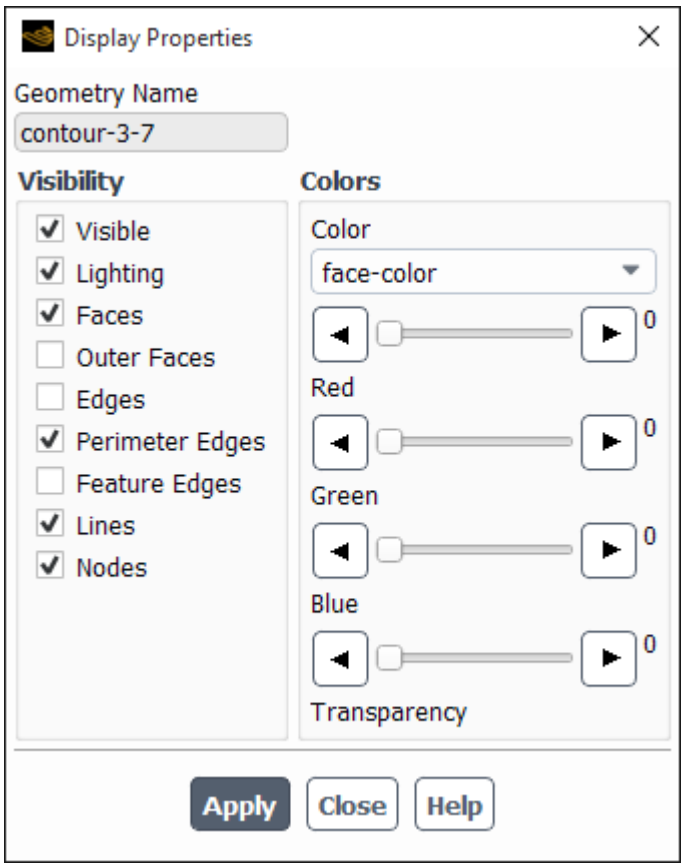
deletes the geometric object that is currently selected in the **Names** list. The ability to delete individual objects is especially useful if you have overlays on and you generate an unwanted object (for example, if you generate contours of the wrong variable). You can simply delete the unwanted object and continue your scene composition, instead of starting over from the beginning.

Apply

saves the status of **Overlays** and **Draw Frame**. When you turn **Overlays** or **Draw Frame** on or off, you must click the **Apply** button to see the effect of the change on subsequent display operations.

50.18.21. Display Properties Dialog Box

To modify the color, visibility, and other display properties for individual geometric objects in the graphics display, use the **Display Properties** dialog box. You can open this dialog box by clicking the **Display...** push button in the Scene Description Dialog Box (p. 5211). See Changing an Object's Display Properties (p. 4010) for details about the items below.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Geometry Name

displays the name of the object you selected for modification in the Scene Description Dialog Box (p. 5211).

Visibility

contains check buttons that control options related to the visibility of the selected object. See Controlling Visibility (p. 4011) for details.

Visible

toggles the visibility of the selected object. If it is turned on, the object will be visible in the display, and if it is turned off, the object will be invisible.

Lighting

turns the effect of lighting for the selected object on or off. You can choose to have lighting affect only certain objects instead of all of them. Note that if **Lighting** is turned on for an object such as a contour or vector plot, the colors in the plot will not be exactly the same as those in the colormap at the left of the display.

Faces

toggles the filled display of faces for the selected mesh or surface object. Turning **Faces** on has the same effect as turning on the display of faces in the Mesh Display Dialog Box (p. 4636).

Outer Faces

toggles the display of outer faces.

Edges

toggles the display of interior and exterior edges of the geometric object.

Perimeter Edges

toggles the display of the outline of the geometric object. (This option has no effect on the display of meshes.)

Feature Edges

toggles the display of feature lines (if any) of the geometric object.

Lines

toggles the display of the lines (if any) in the geometric object.

Nodes

toggles the display of the nodes (if any) in the geometric object.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Colors

contains controls for setting face, edge, line, and node colors, and transparency for faces. See Controlling Object Color and Transparency (p. 4012) for details.

Color

specifies the face, edge, line, or node color for modification. When you turn on this button, the color scales below will show the current color specification, which you can modify by moving the sliders on the color scales.

Red, Green, Blue

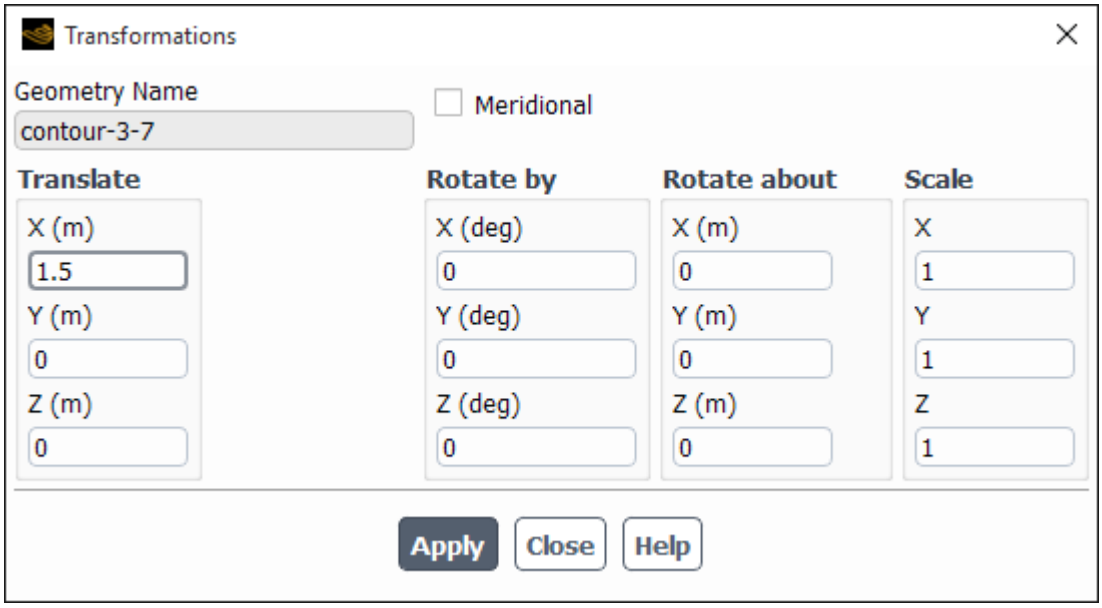
are color scales with which you can specify the RGB components of the face, edge or line color.

Transparency

sets the relative transparency of the selected object. An object with a transparency of 0 is opaque, and an object with a transparency of 100 is transparent.

50.18.22. Transformations Dialog Box

You can use the **Transformations** dialog box to translate, rotate, or scale individual objects in the graphics display. To open this dialog box, click the **Transform...** push button in the Scene Description Dialog Box (p. 5211). See Transforming Geometric Objects in a Scene (p. 4013) for details about the items below.



Controls

Geometry Name

displays the name of the object you selected for modification in the Scene Description Dialog Box (p. 5211).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Meridional

(3D only) enables the display of the meridional view. This option is especially useful in turbomachinery applications.

Translate

contains **X**, **Y**, and **Z** real number fields in which you can enter the distance by which to translate the selected object in each direction.

Rotate by

contains **X**, **Y**,and **Z** integer number fields in which you can enter the number of degrees by which to rotate the selected object about each axis.

Rotate about

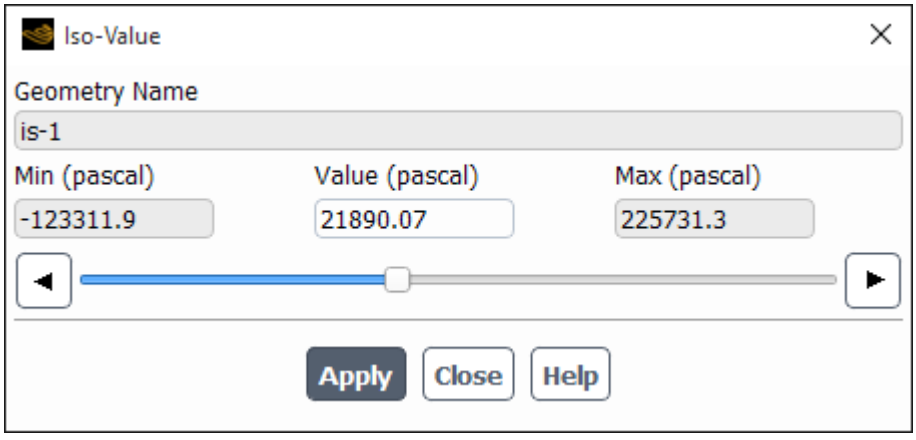
specifies the point about which to rotate the object.

Scale

contains **X**, **Y**, and **Z** real number fields in which you can enter the amount by which to scale the selected object in each direction. To avoid distortion of the object's shape, be sure to specify the same value for all three entries.

50.18.23. Iso-Value Dialog Box

The **Iso-Value** dialog box allows you to change the isovalue of an isosurface. The isosurface can be selected directly in the **Names** list or indirectly by selecting an object displayed on the isosurface. When you change the isovalue, any contours, vectors, and so on that were displayed on the original isosurface will be displayed on the isosurface with the new isovalue. To open this dialog box, click the **Iso-Value...** push button in the Scene Description Dialog Box (p. 5211). See Modifying Iso-Values (p. 4015) for details about using this dialog box.



Controls

Geometry Name

displays the name of the geometric object (isosurface) you selected for modification in the Scene Description Dialog Box (p. 5211).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min, Max

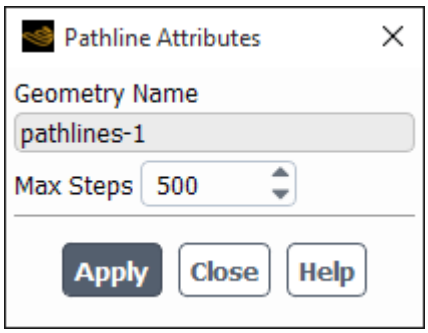
show the minimum and maximum values of the isosurface variable.

Value

sets the new isovalue for isosurfaces. After you change the value and click **Apply**, contours, vectors, or pathlines that were displayed on the original isosurface will be displayed for the new isovalue. You can also use the slide bar to change the **Value**.

50.18.24. Pathline Attributes Dialog Box

The **Pathline Attributes** dialog box allows you to change the number of steps used in the computation of pathlines. This is most useful in creating animations of pathlines. To open this dialog box, click the **Pathlines...** button in the Scene Description Dialog Box (p. 5211). See Modifying Pathline Attributes (p. 4015) for details about using this dialog box.



Controls

Geometry Name

displays the name of the geometric object you selected for modification in the Scene Description Dialog Box (p. 5211).

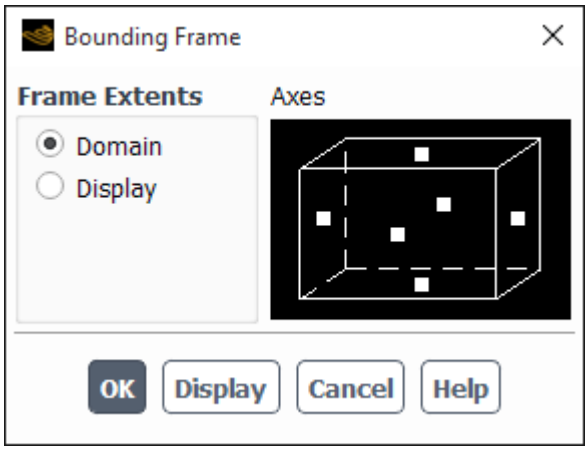
Max Steps

sets the new maximum number of steps for pathline computation. After you change the value and click **Apply**, the selected pathline will be recomputed and redrawn.

50.18.25. Bounding Frame Dialog Box

The **Bounding Frame** dialog box allows you to add a bounding frame with optional measure markings to the display of the domain. See Adding a Bounding Frame (p. 4016) for details about the items in this dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Frame Extents

indicates the extents of the bounding frame.

Domain

specifies that the frame should encompass the domain extents.

Display

specifies that the frame should encompass the portion of the domain that is shown in the display.

Axes

contains controls for specifying the frame boundaries and measurements. See Adding a Bounding Frame (p. 4016) for instructions on using these items.

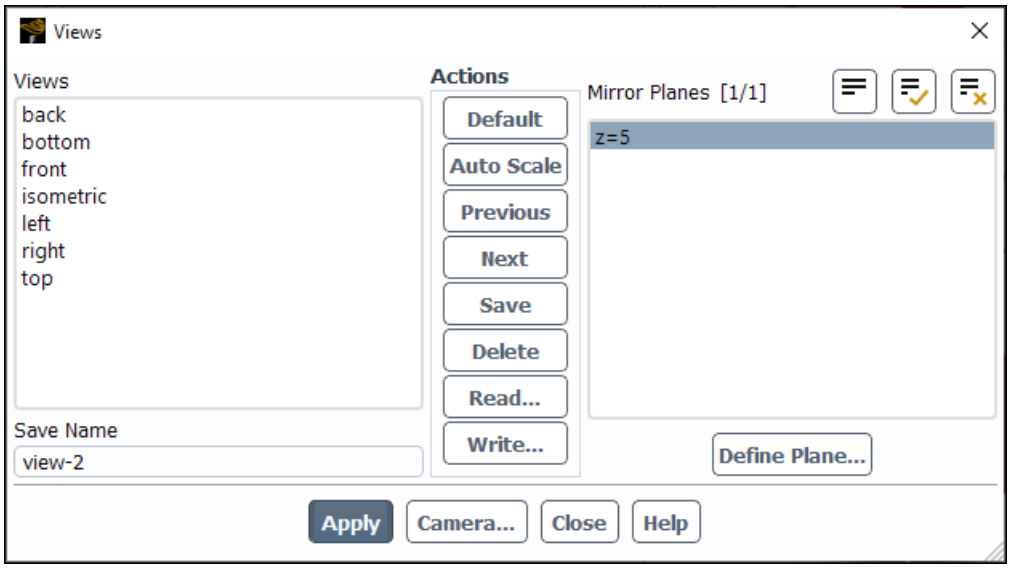
Display

updates the active graphics window with the current frame settings.

50.18.26. Views Dialog Box

With the **Views** dialog box, you can make various modifications to the view displayed in the active graphics window. See Controlling the Display State and Modifying the View (p. 3993) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Views

lists the currently defined views. Clicking on a view name highlights that name and enters it into the **Name** field. Double-clicking on a view name restores that view in the active graphics window.

Save Name

specifies the name to use when saving a view.

Actions

contains buttons for performing various actions related to the **Views** list and the **Save Name**.

Default

restores the "front" view in the active graphics window.

Auto Scale

modifies the view in the active graphics window by scaling and centering the current scene without changing its orientation.

Previous

allows you to return to previous displays.

Save

stores the view in the active graphics window with the name in the **Save Name** box. See Saving Views (p. 4002) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

removes the selected view name from the **Views** list.

> **Important:**
>
> Be careful not to delete any of the pre-defined views.

Read...

opens The Select File Dialog Box (p. 907), in which you can specify the name of a view file to be read. See Reading View Files (p. 4003) for details.

Write...

opens the Write Views Dialog Box (p. 5220), in which you can select the views to be saved to a view file. See Saving Views (p. 4002) for details.

Mirror Planes

displays a list of all symmetry planes in the domain. Mirror images are drawn for all selected symmetry planes. See Mirroring and Periodic Repeats (p. 4003) for details.

Define Plane...

opens the Mirror Planes Dialog Box (p. 5221), in which you can define a mirror plane for a non-symmetric domain.

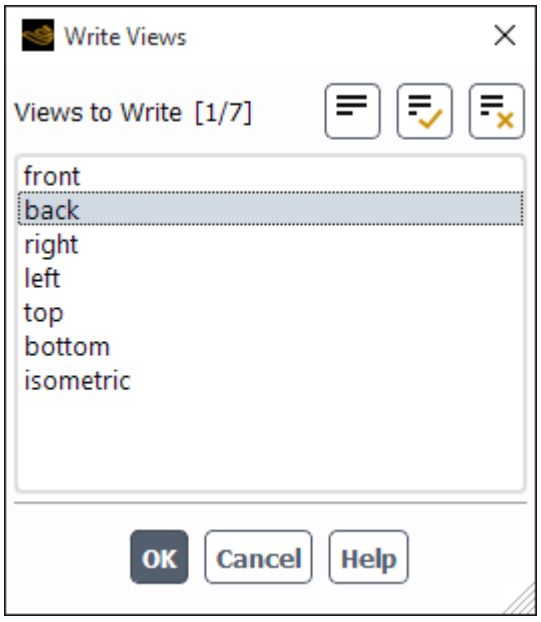
Camera...

opens the Camera Parameters Dialog Box (p. 5223).

50.18.27. Write Views Dialog Box

The **Write Views** dialog box allows you to save selected views to a view file. To open it, click **Write...** in the Views Dialog Box (p. 5218). This feature allows you to transfer views between case files. See Saving Views (p. 4002) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



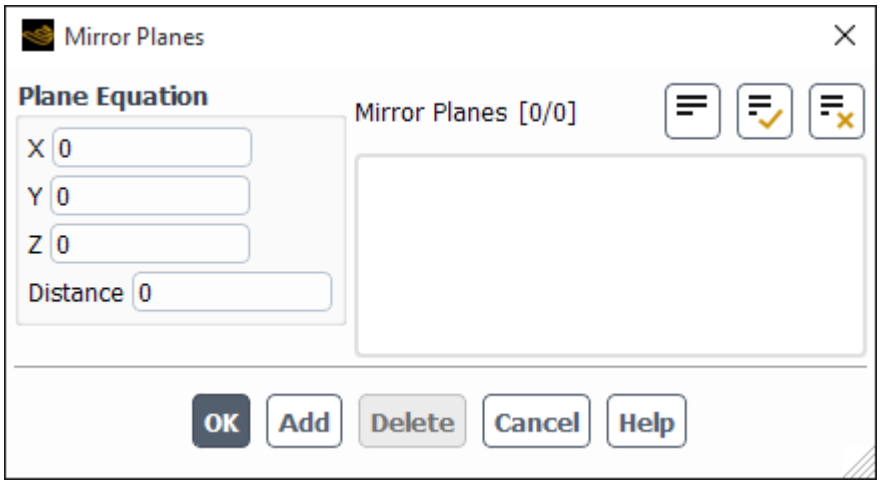
Controls

Views to Write

is a selectable list of the defined views. The selected views will be saved to a view file when you click **OK**.

50.18.28. Mirror Planes Dialog Box

The **Mirror Planes** dialog box allows you to define a symmetry plane for a non-symmetric domain for use with graphics. To open it, click **Define Plane...** in the Views Dialog Box (p. 5218). See Mirroring for Graphics (p. 4008) for details.



Controls

Plane Equation

contains inputs for specifying the equation for the mirror plane: A **X** + B **Y**+ C **Z** = **Distance**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mirror Planes

contains a list of all mirror planes you have defined using this dialog box. (Mirror planes that exist in the domain due to symmetry will not appear in this list, since they cannot be modified.)

Add

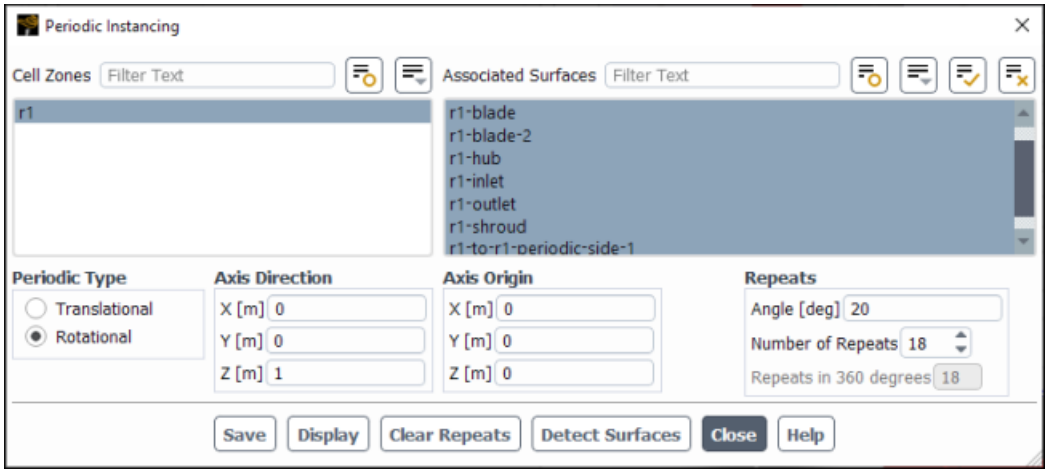
adds the plane defined by the **Plane Equation** to the **Mirror Planes** list.

Delete

deletes the plane(s) selected in the **Mirror Planes** list.

50.18.29. Periodic Instancing Dialog Box

The **Periodic Instancing** dialog box allows you to define a periodic repeats, periodic rotation or translation for a non-periodic domain for use with graphics. To open it, click **Periodic Instancing...** in the **View** ribbon tab (**Display** group box). See Periodic Repeats for Graphics (p. 4006) for details.



Controls

Cell Zones

contains the list of the zones in the mesh. You can select one or more zones in this list and specify different periodicity parameters for each zone separately.

Associated Surfaces

contains the list of the surfaces associated with the selected cell zone.

Periodic Type

specifies **Rotational** or **Translational** periodicity.

Angle

specifies the angle by which the domain is rotated to create the periodic repeat. This item is available when you select **Rotational** as the **Periodic Type**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Translation

specifies the distance in the **X**, **Y**, and **Z** directions by which the domain is translated to create the periodic repeat. This item will appear when you select **Translational** as the **Periodic Type**.

Axis Direction

specifies the direction vector (**X,Y,Z**) for the axis of rotation. This item is available when you select **Rotational** as the **Periodic Type** and the domain is three-dimensional.

Axis Origin

specifies the origin of the axis of rotation. This item is available when you select **Rotational** as the **Periodic Type**.

Number of Repeats

specifies the number of times you want to repeat the periodic domain. Positive values repeat the zone in the direction of rotation. Negative values repeat the zone in the opposite direction of rotation.

Save

saves the periodicity you have defined for the case setup.

Display

saves the current settings and displays the results.

Important:

The surfaces you want to see repeated or translated must already be displayed in the graphics window for you to see any changes in the contents of the graphics window when you click **Display** (for example, mesh display, contours, and so on).

Clear Repeats

Resets the **Number of Repeats** to 1 and saves the settings change.

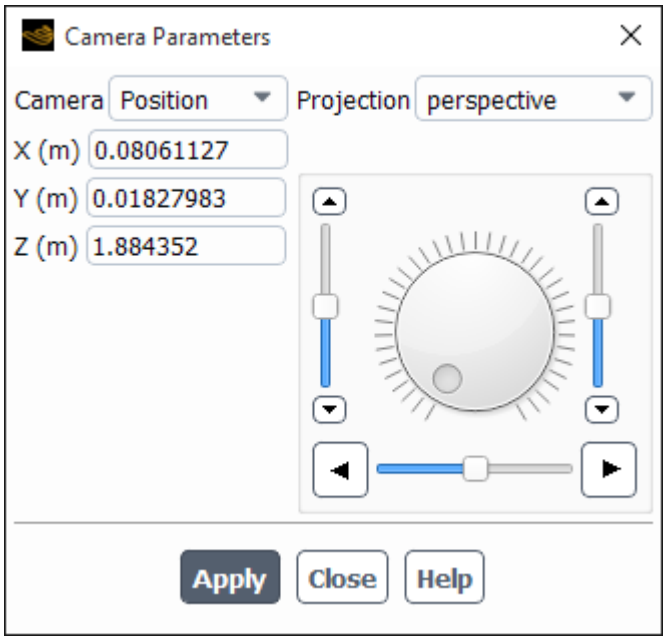
Detect Surfaces

Fluent automatically assesses the loaded case file and selects what it thinks are the appropriate cell zones, surfaces, and other settings (such as angle and number of repeats) for this problem, and saves them.

50.18.30. Camera Parameters Dialog Box

The **Camera Parameters** dialog box allows you to modify the "camera" through which you are viewing the graphics display. See Controlling Perspective and Camera Parameters (p. 4000) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Camera

contains a drop-down list of the parameters that define the camera (**Position**, **Target**, **Up Vector**, and **Field**) and **X**, **Y**, and **Z** fields in which you can define the coordinates or field distances for the parameter selected in the drop-down list. Figure 39.81: Camera Definition (p. 4001) illustrates the definition of the camera by these parameters.

Projection

contains a drop-down list that allows you to select a **Perspective** or **Orthographic** view.

(Dial and Sliders)

allow you to rotate and scale the graphics display. The slider on the scale to the left of the dial rotates the display about the horizontal axis at the center of the screen, the slider on the scale below the dial rotates the display about the vertical axis at the center of the screen, and the dial controls rotation about the axis at the center of and perpendicular to the screen. The slider on the scale to the right of the dial zooms in or out in the display. See Rotating the Display (p. 3997) and Zooming the Display (p. 3999) for details.

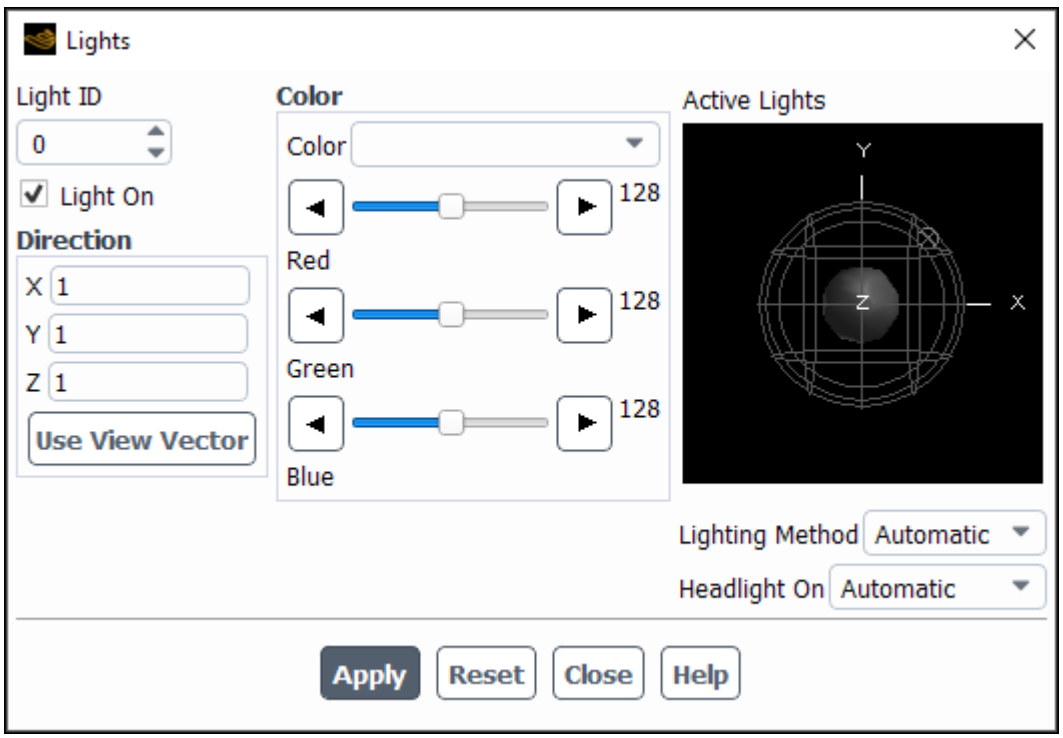
Important:

When you are using the sliders and dial to manipulate the view, you may want to turn off **Wireframe Animation** in the Display Options Dialog Box (p. 5208), so that you can watch the display move interactively while you are moving the slider or the dial indicator.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.18.31. Lights Dialog Box

The **Lights** dialog box provides an interactive mechanism for placing colored, directional lights in a scene. See Adding Lights (p. 3954) for details about the items below.



Controls

Light ID

indicates the light that is being added, deleted, or modified. By default, light 1 is defined to be dark gray with a direction of (1,1,1).

Light On

indicates whether or not the light specified in **Light ID** is on or off. By turning off the **Light On** option for a particular light, you can remove this light from the display, while still retaining its definition. To add it to the display again, simply turn on the **Light On** button.

Direction

allows you to specify the direction of the light (the position on the unit sphere from which the light emanates) by entering the **X**, **Y**, and **Z** coordinates or by computing the coordinates based on the current view in the graphics window.

X,Y,Z

specify the direction of the light. For example, the direction (1,1,1) means that the rays from the light will be parallel to the vector from (1,1,1) to the origin.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use View Vector

updates the **X,Y,Z** fields with the appropriate values for the current view in the active graphics window, and shines a light in that direction. Instead of entering the **X,Y,Z** values for a light's direction vector, you can use your mouse to change the view in the graphics window so that your position in reference to the geometry is the position from which you would like a light to shine. You can then click the **Use View Vector** button to update the **X,Y,Z** fields with the appropriate values for your current position and update the graphics display with the new light direction. This method is convenient if you know where you want a light to be, but you are not sure of the exact direction vector.

Color

allows you to specify the light color with sliders. You can create your desired color by increasing and decreasing the slider values for the colors **Red**, **Green**, and **Blue**. You can also enter a descriptive string (for example, lavender) in the **Color** field.

Active Lights

shows the position and color of all defined directional lights, and allows you to change the position of a light. All directional lights in Ansys Fluent are assumed to be at infinity and pass through the unit sphere at the position shown. All light rays arriving at the scene from one light are parallel. The colored markers on the surface of the sphere represent the color and direction of these *distant* lights. These lights point towards the center of the sphere (the origin, which is usually where the geometry is).

Lighting Method

specifies the method to be used in lighting interpolation: **Automatic**, **Off**, **Flat**, **Gouraud**, or **Phong**. (**Flat** is the most basic method: there is no interpolation within the individual polygonal facets. **Gouraud** and **Phong** have smoother gradations of color because they interpolate on each facet.) When **Off** is selected, lighting effects are disabled.

Headlight On

enables constant lighting effects in the direction of the view. The **Automatic** option automatically enables/disables the headlight depending on the type of display in the graphics window.

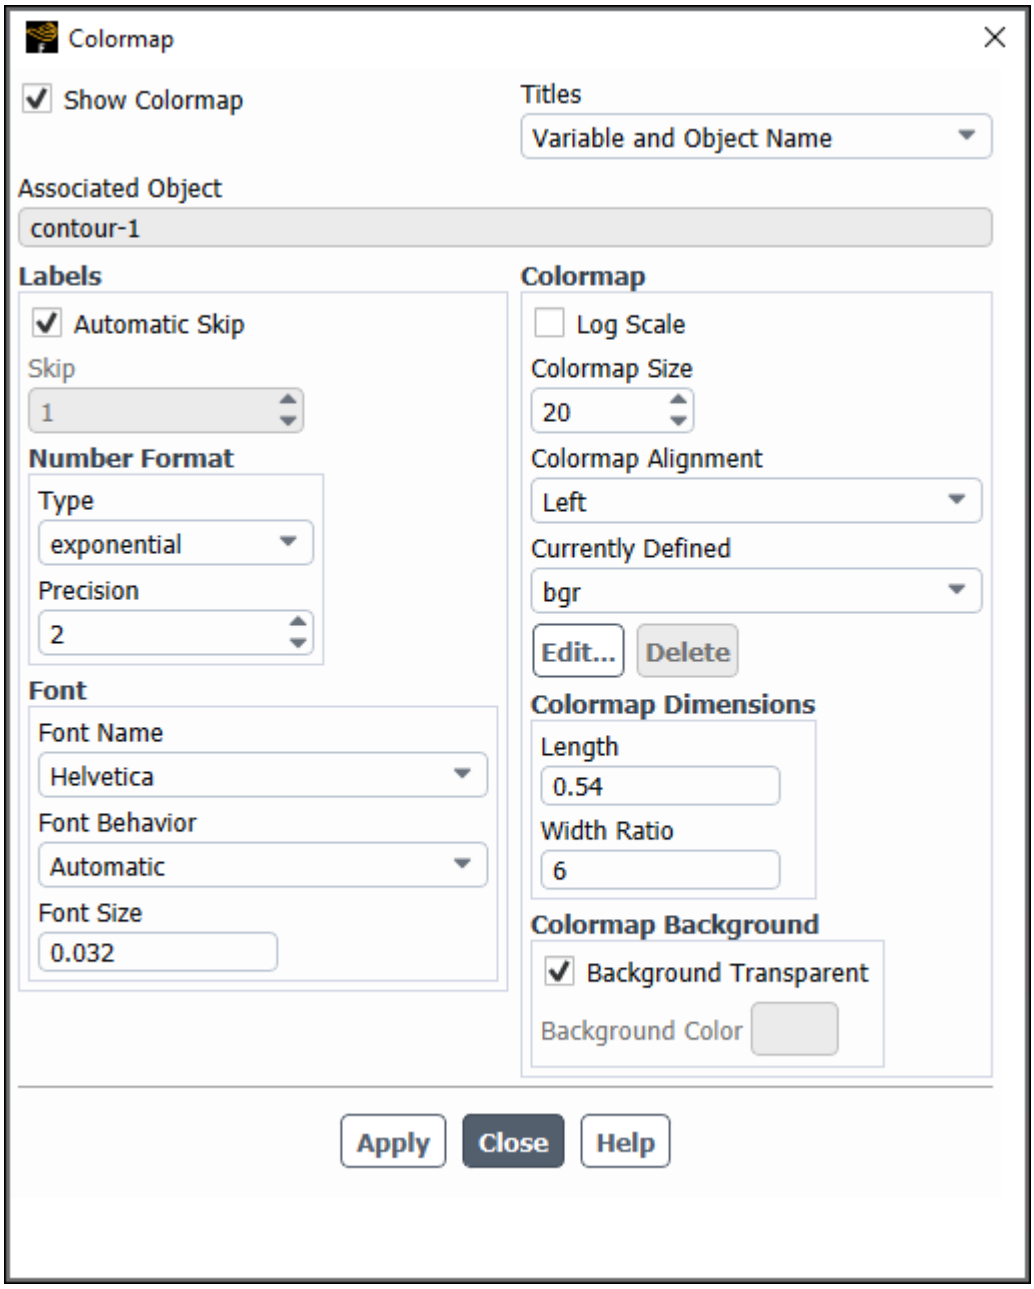
Reset

resets the light definitions to their last saved state (the lighting that was in effect the last time you opened the dialog box or clicked on **Apply**).

50.18.32. Colormap Dialog Box

The **Colormap** dialog box allows you to select and modify existing colormaps. See Selecting a Colormap (p. 3950) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Show Colormap

this option is only visible when accessed through a graphics object dialog box, such as **Contours** or **Vectors**. It allows you to turn the display of the colormap in the graphics window on/off.

Alternatively, you can temporarily hide a colormap by clicking the 'X' that appears in the upper-right of the colormap when you hover over it in the graphics window. There is also a context menu option to temporarily show a hidden colormap. Refer to *Changing the Colormap and Range (p. 3933)* *for additional information.*

Titles

controls what identifying titles are displayed on the colormap. The options include:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Variable and Object Name**—both the variable name and the associated graphics object are listed with the colormap, along with the units.
- **Variable Only**—only the variable name and the units are listed with the colormap.
- **None**—only the units are listed with the colormap.

Labels

allows you to customize the display of your colormap labels.

Automatic Skip

automatically skips enough labels so that they are all legible. Disabling will display the number of labels determined by the **Skip** and **Colormap Size** fields.

Skip

sets the number of labels to be skipped.

Number Format

contains controls for changing the format of the labels on the color scale. These labels are the character strings used to define the color divisions at the left of the graphics window.

Type

sets the form of the labels. You may select from a drop-down list of options, including the following:

general

displays the real value with either float or exponential form based on the size of the number and the defined **Precision**.

float

displays the real value with an integral and fractional part (for example, 1.0000), where the number of digits in the fractional part is determined by **Precision**.

exponential

displays the real value with a mantissa and exponent (for example, 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by **Precision**.

Precision

defines the number of fractional digits displayed in the labels.

Font

allows you to customize the display of your colormap font.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Font Name

lists the available colormap fonts.

Font Behavior

controls whether the font size updates automatically when the colormap is resized or if the font is always a fixed size.

Font Size

when **Font Behavior** is set to **Automatic**, this field controls the font size as a percentage of the colormap size. When the **Font Behavior** is set as **Fixed**, you can set the **Font Size** to a fixed size that is familiar from word processors.

Colormap

contains controls for the colormap size and scale, and for selection of a defined colormap.

Log Scale

enables the use of a logarithmic scale for the color scale (rather than the default decimal scale). See Specifying the Colormap Size and Scale (p. 3950) for details.

Colormap Size

specifies the number of distinct colors in the colormap. You may specify from 2 to 100 colors.

Currently Defined

contains a drop-down list of all pre-defined colormaps and all custom colormaps defined by you. Select the colormap to be used from this list.

Edit...

opens the Colormap Editor Dialog Box (p. 5230), in which you can create a custom colormap.

Delete

Delete the colormap that is selected in the **Currently Defined** drop-down list.

Note:

- You can only delete user-defined colormaps, not the ones that come with Ansys Fluent.
- If you delete a user-defined colormap that is assigned to a graphics object, the graphics object will revert to the colormap selected in the **Colormap** field in Preferences (**Graphics** branch, under **Colormap Settings**).

Colormap Dimensions

allows you to customize the "physical" size of your colormap in the graphics window.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Length

controls the "height" for vertical colormaps, or the "length" for horizontal colormaps, as a percentage of graphics window height or width, respectively.

Width Ratio

controls the "width" of a vertical colormap or the "height" of a horizontal colormap, as a ratio of the **Length** field. Decreasing the **Width Ratio** increases the "width" or "height" of the colormap, respectively.

Colormap Background

allows you to control the appearance of the colormap background.

Background Transparent

enabling this option makes the background of the colormap transparent.

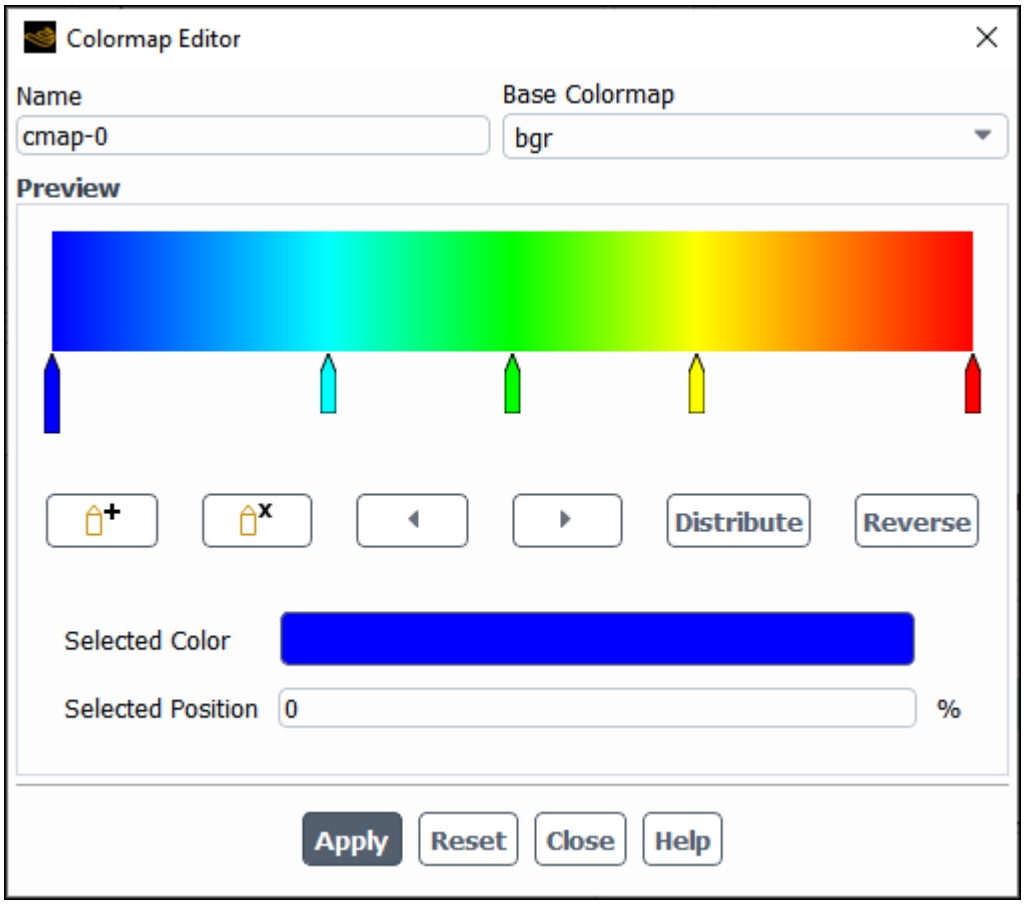
Background Color

specifies which color will be used for the colormap background when the **Background Transparent** option is disabled.

50.18.33. Colormap Editor Dialog Box

The **Colormap Editor** dialog box allows you to create custom colormaps. See Creating a Customized Colormap (p. 3952) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

is the name that will be applied to the modified colormap.

Base Colormap

is the baseline colormap that you are modifying. You can use this drop-down list to select a different baseline colormap.

Preview

allows you to interactively modify the colormap. Drag the "stops" ( ) to modify the color and color distribution.

Add Stop

clicking "add stop" ( ) adds another color stop next to the selected stop.

Remove Stop

clicking "remove stop" ( ) removes the selected color stop.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Left Arrow

clicking the left arrow ( ) selects the next stop to the left.

Right Arrow

clicking the right arrow ( ) selects the next stop to the left.

Distribute

evenly distributes the stops on the colormap.

Reverse

reverses the colors on the colormap.

Selected Color

shows the color of the selected stop. Clicking the colored field to the right, opens the **Select Color** dialog box, allowing you to choose a different color for the selected stop.

Selected Position

shows the position in the colormap of the selected stop as a percentage, with 0% being the left-most stop and 100% being the right-most stop.

Apply

saves the colormap with the name displayed in the **Name** field. *Note that you cannot overwrite the system colormaps that come with Ansys Fluent.*

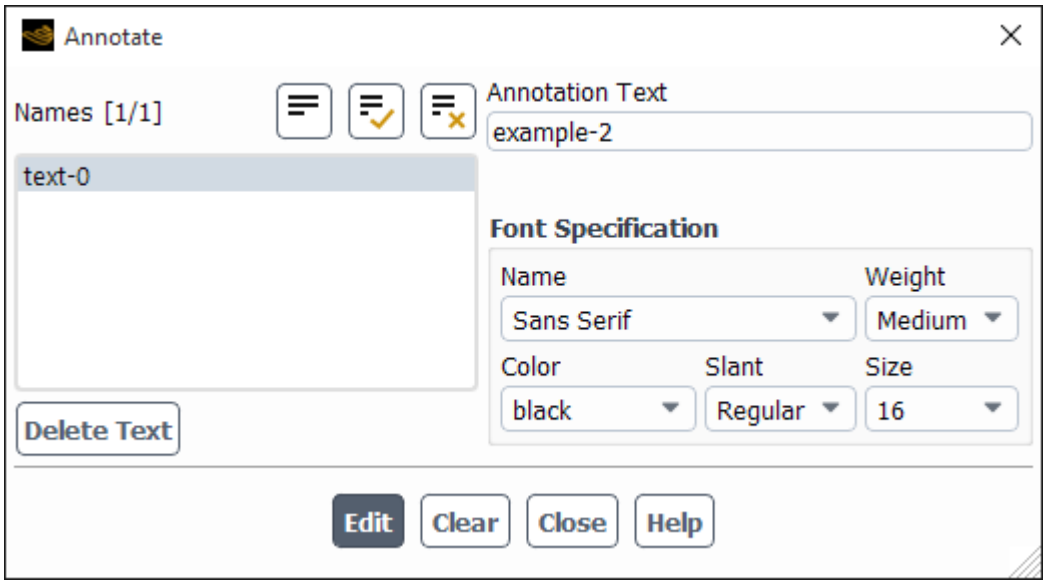
Reset

resets the preview to match the **Base Colormap**.

50.18.34. Annotate Dialog Box

You can use the **Annotate** dialog box to add text with optional attachment lines to the graphics windows, or to modify existing text. See Adding Text Using the Annotate Dialog Box (p. 3931) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Names

contains a selectable list of all annotation text strings that have been defined. You can choose a text string to be deleted or edited.

Delete Text

deletes the text strings selected in the **Names** list from the display.

Annotation Text

contains the annotation text string you want to add, or the annotation text string for the item selected in the **Names** list.

Font Specification

contains controls for defining or modifying the font in the annotation text string.

Name

contains a drop-down list of various font styles.

Weight

contains a drop-down list from which you can select **Medium** or **Bold**.

Color

contains a drop-down list of colors that can be used for the text.

Slant

contains a drop-down list from which you can select **Regular** or **Italic** as the slant type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Size

contains a drop-down list of font sizes (in points).

Add

adds the current **Annotation Text** to the active graphics window. A dialog box will prompt you to select a screen location using the mouse-probe button.

1. Change the behavior of the left-mouse-button to "probe" by clicking the probe button in the graphics toolbar ( ).
2. If you click the mouse button once in the desired location, the text will be placed at that point. Dragging the mouse with the left-mouse-button depressed will draw an attachment line from the point where the mouse was first clicked to the point where it was released. The annotation text will be placed at the point where the mouse button was released.

Edit

updates the edited text in the active graphics window. This button will replace the **Add** button when you are editing an existing text string from the **Names** list.

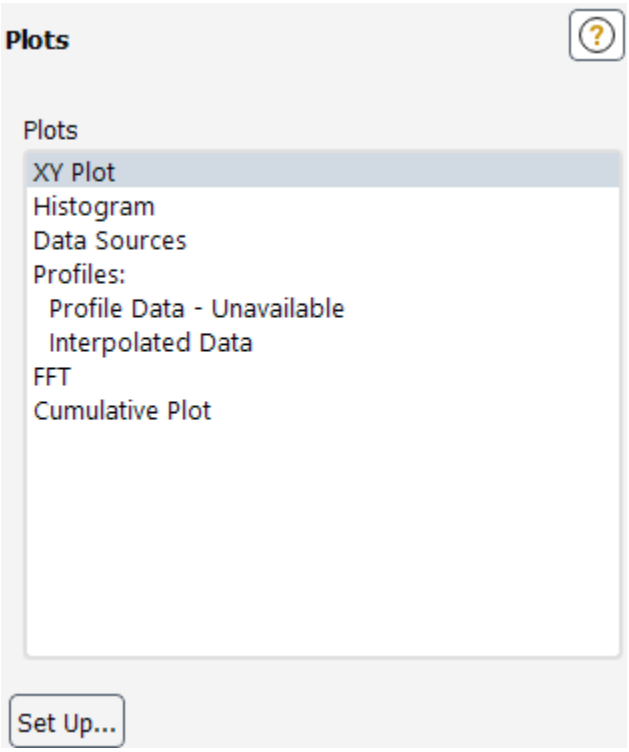
Clear

removes all annotation text and attachment lines from the active graphics window.

50.19. Plots Task Page

The **Plots** task page allows you to create plots (XY, histograms, profiles, and so on) of your computational results. See Displaying Graphics (p. 3847) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Plots

contains a listing of the various plot types available in Ansys Fluent.

You can double-click an item in the **Plots** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

XY Plot

selecting this item and clicking the **Set Up...** button opens the Solution XY Plot Dialog Box (p. 5236).

Histogram

selecting this item and clicking the **Set Up...** button opens the Histogram Dialog Box (p. 5240).

File

selecting this item and clicking the **Set Up...** button opens the Plot Data Sources Dialog Box (p. 5242).

Profiles

two types of profile plots are available:

Profile Data

selecting this item and clicking the **Set Up...** button opens the Plot Profile Data Dialog Box (p. 5245).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Interpolated Data

selecting this item and clicking the **Set Up...** button opens the Plot Interpolated Data Dialog Box (p. 5246).

FFT

selecting this item and clicking the **Set Up...** button opens the Fourier Transform Dialog Box (p. 5248).

Set Up...

displays the dialog box corresponding to the selected item in the **Plots** list.

For additional information, see the following sections:

50.19.1. Solution XY Plot Dialog Box
50.19.2. Histogram Dialog Box
50.19.3. Plot Data Sources Dialog Box
50.19.4. Plot Profile Data Dialog Box
50.19.5. Plot Interpolated Data Dialog Box
50.19.6. Fourier Transform Dialog Box
50.19.7. Ansys Sound Analysis Dialog Box
50.19.8. Cumulative Plot Dialog Box
50.19.9. Plot/Modify Input Signal Dialog Box
50.19.10. Axes Dialog Box
50.19.11. Curves Dialog Box

50.19.1. Solution XY Plot Dialog Box

The **Solution XY Plot** dialog box allows you to display zone, surface and file data in an XY plot format. See Steps for Generating Solution XY Plots (p. 4027) for details about the items below.

*You can also access the **Solution XY Plot** dialog box through the **Postprocessing** ribbon tab.*

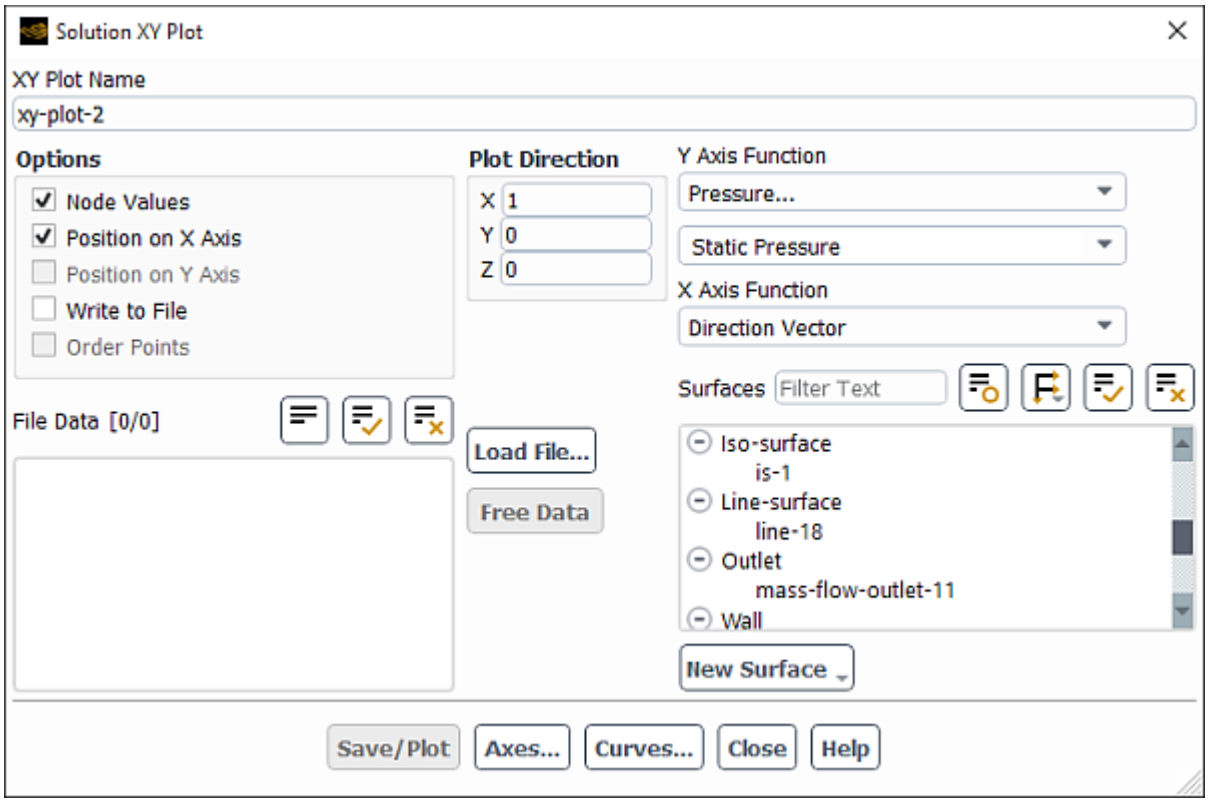
Postprocessing → **Plots** → **XY Plot** → **New...**

Note:

- The "global"/non-persistent form of graphics objects is hidden by default. If this interrupts your workflow, you can make them available by enabling the **Expose legacy non-persistent graphics** option in the **Graphics** branch of **Preferences** (accessed via **File**>**Preferences...**).
- (When you click **Edit...** instead of **New...**, it opens the "global"/non-persistent version of the **Solution XY Plot** dialog box. This version of the dialog box does not have a **Name** field and it is not saved with the case file.

  You are encouraged to use the persistent version that is accessed by clicking **New...**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

XY Plot Name

is the name for a solution XY plot definition. You can specify a name or use the default name **xy-plot-*id***. This control appears only for solution XY plot definitions.

Options

contains check buttons that control the presentation of node or cell-averaged values, the selection of axis functions, and the ability to write the plot data to a file.

Node Values

toggles the node averaging of the data presented in the plot. If the option is disabled, boundary face values are presented. See Choosing Node or Cell Values (p. 4031) for details.

Position on X Axis, Position on Y Axis

set the x-axis or y-axis function to be the position. If one of these options is turned on, the other will automatically be turned off. You can turn both options off to generate a plot of one flow-field function vs. another, selecting the function for each axis using the **X Axis Function** and **Y Axis Function** drop-down lists.

Write to File

activates the file-writing option. When this option is selected, the **Plot** push button will change to **Write...**. Clicking on the **Write...** button will open the **Select File** dialog box (The Select

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Dialog Box (p. 907)), in which you can specify a name and save a file containing the plot data. The format of this file is described in XY Plot File Format (p. 4038).

Order Points

specifies that plot data being saved to a file should be sorted in order of ascending x axis value. This option is available only when the **Write to File** option is turned on.

Plot Direction

contains inputs for defining the plot direction.

If **Direction Vector** (the default) is selected in the **X Axis Function** or **Y Axis Function** drop-down list (whichever is the position axis), the inputs are the components of the direction vector. The position axis of the plot will have coordinate values that correspond to the dot product of the data coordinate vector with the plot direction vector. See Steps for Generating Solution XY Plots (p. 4027) for details.

X

is the component in the x direction.

Y

is the component in the y direction.

Z

is the component in the z direction.

If **Curve Length** is selected in the **X Axis Function** or **Y Axis Function** drop-down list (whichever is the position axis), the inputs are the direction along the length of the surface selected in the **Surfaces** list. See Steps for Generating Solution XY Plots (p. 4027) for details.

Default

specifies the plot direction as the direction of increasing curve length.

Reverse

specifies the plot direction as the direction of decreasing curve length.

Show

displays the selected surface in the graphics window, marking the start of the surface with a blue dot and the end of the surface with a red dot. Ansys Fluent will also display arrows on the surface showing the direction in which the variable will be plotted.

Y Axis Function, X Axis Function

contain lists of solution variables that can be used for the y or x axis of the plot. If the **Position on X Axis** option is turned on, **X Axis Function** will become a single drop-down list, containing two options: **Direction Vector** (to plot the selected variable as a function of position along a specified direction vector) and **Curve Length** (to plot the selected variable as a function of position

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

along the length of a specified curvilinear surface). See Steps for Generating Solution XY Plots (p. 4027) for details.

Likewise, if **Position on Y Axis** is turned on, **Y Axis Function** will become a single drop-down list containing **Direction Vector** and **Curve Length**. If both **Position on X Axis** and **Position on Y Axis** are turned off, you can select field functions for both axes using the **X Axis Function** and **Y Axis Function** lists.

Note:

When running the parallel version of Ansys Fluent, **Curve Length** is only supported when the curvilinear surface is contained within a single partition.

File Data

is a selectable list of the plot titles associated with the loaded external data files. You may choose any number of files for the data plot. The files are loaded using the **Load File...** push button. The format of these files is presented in XY Plot File Format (p. 4038). See Including External Data in the Solution XY Plot (p. 4030) for details.

Load File...

opens the **Select File** dialog box (The Select File Dialog Box (p. 907)), in which you can select the plot file to be read. See Including External Data in the Solution XY Plot (p. 4030) for details. After the external file is loaded, its plot title will be displayed in the **File Data** list.

Free Data

removes the files selected in the **File Data** list.

Surfaces

is a selectable list of surfaces in the solution domain. You may choose any number of surfaces for the data plot.

New Surface

is a drop-down list button that contains a list of surface options:

Point

opens the Point Surface Dialog Box (p. 5525).

Line/Rake

opens the Line/Rake Surface Dialog Box (p. 5458).

Plane

opens the Plane Surface Dialog Box (p. 5523).

Quadric

opens the Quadric Surface Dialog Box (p. 5527).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Iso-Surface

opens the Iso-Surface Dialog Box (p. 5445).

Iso-Clip

opens the Iso-Clip Dialog Box (p. 5444).

Structural Point

opens the Structural Point Surface Dialog Box (p. 5565).

Plot

plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the **Write to File** option is turned on, this button becomes the **Write...** button.

Write...

opens the **Select File** dialog box (The Select File Dialog Box (p. 907)), in which you can save the plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the XY plot.

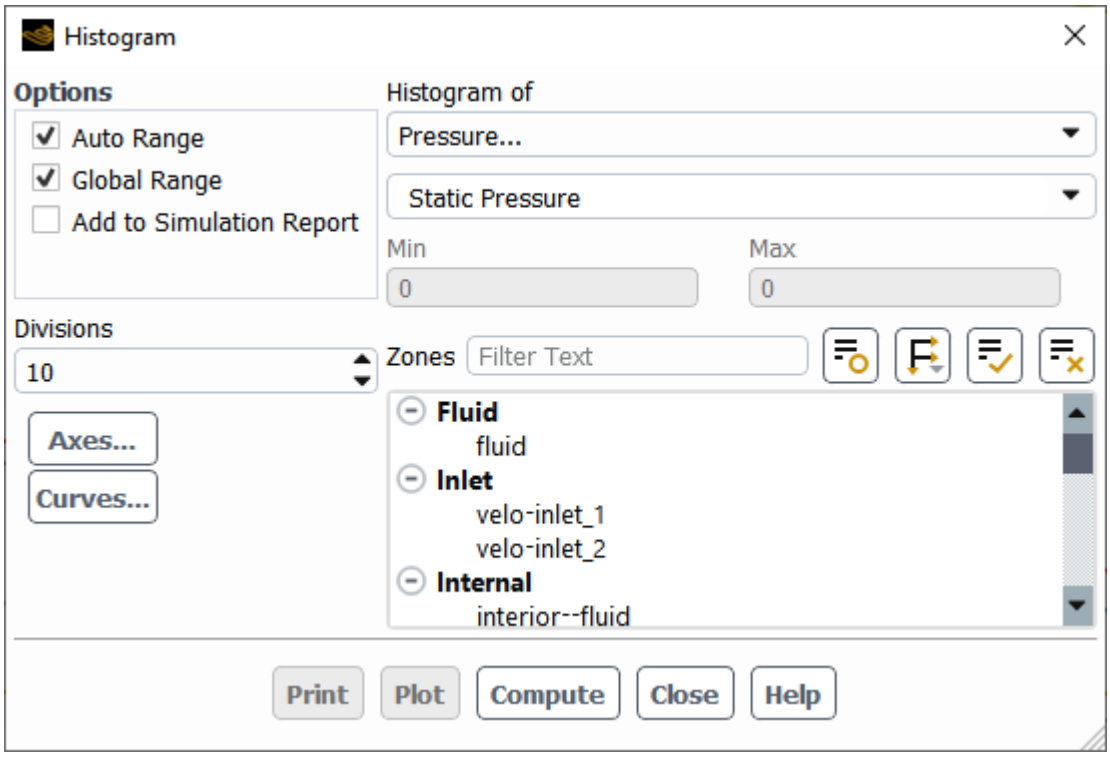
Save/Plot

plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes and saves the XY plot definition. This button appears only for solution XY plot definitions and replaces the **Plot** button.

50.19.2. Histogram Dialog Box

The **Histogram** dialog box allows you to create histograms of selected geometric or physical data. See Steps for Generating Histogram Plots (p. 4039) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the check buttons for current histogram options.

Auto Range

toggles the ability to specify the minimum and maximum range of scalar values in the histogram print or plot. If the option is not active, the **Min** and **Max** fields are editable, and you may specify the desired range. If the option is active, the range is defined by the minimum and maximum values in the computational domain.

Global Range

toggles the ability to specify the minimum and maximum values on the range of values on the selected surfaces, rather than in the entire domain.

Add to Simulation Report

toggles the ability to add the histogram and its data to your simulation report.

Divisions

sets the number of data intervals that will exist in the histogram.

Zone Types

contains a list of available face or cell zone types.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the histogram plot.

Histogram of

contains a list of scalar quantities that can be used in the histogram.

Min

displays or allows definition of the minimum value of the selected scalar quantity used in the histogram.

Max

displays or allows definition of the maximum value of the selected scalar quantity used in the histogram.

Zones

contains a list of available face or cell zones.

Print

displays the histogram interval.

Plot

displays a plot of the percentage of the total number of cells versus the scalar quantity in the active graphics window.

Add To Report

adds the histogram and its data to the simulation report (when the **Add to Simulation Report** option is enabled).

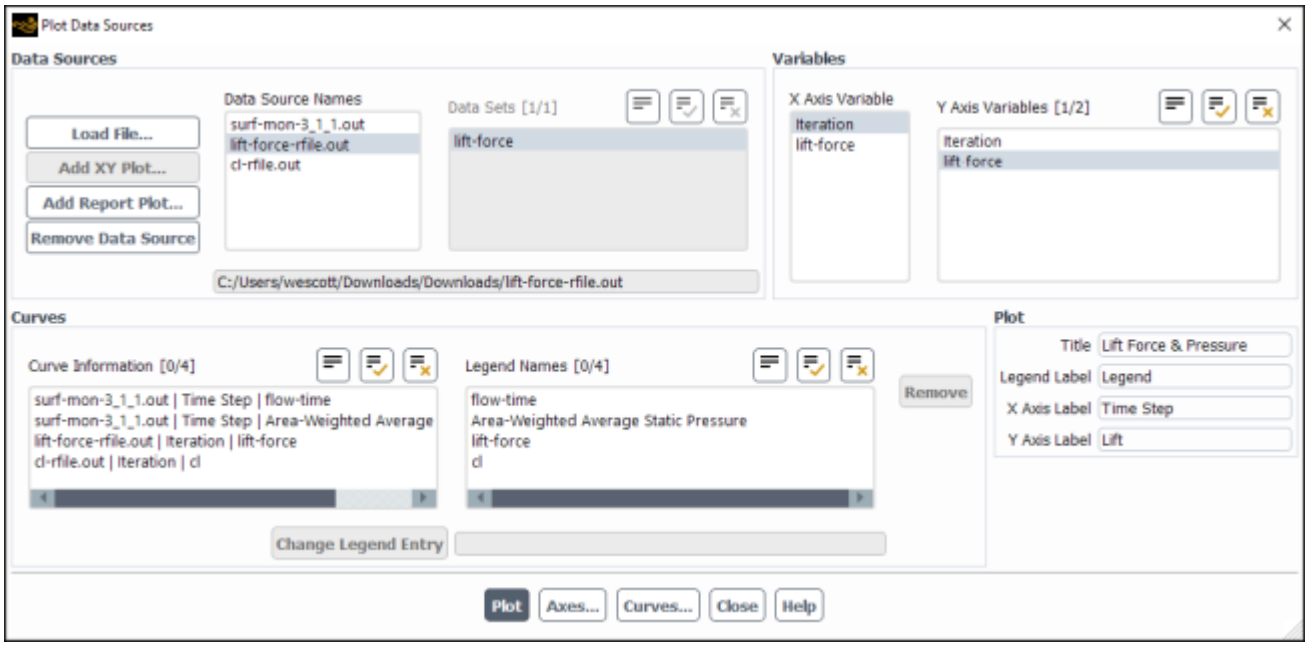
Compute

computes the minimum and maximum cell values of the selected scalar quantity. The values are displayed in **Min** and **Max**.

50.19.3. Plot Data Sources Dialog Box

The **Plot Data Sources** dialog box allows you display data read from one or more files (in an abscissa/ordinate plot form) and combine them with data from XY plot objects and report plots. The format of the plot file is described in XY Plot File Format (p. 4038). See Steps for Generating XY Plots of Data from Multiple Sources (p. 4032) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Data Sources

contains operations and information related to the selected files/plots.

Load file...

opens the **Select File** dialog box, where you can select the file(s) you want to plot.

Add XY Plot...

opens the **Select Plots** dialog box, where you can select the plot(s) you want to include.

Add Report Plot...

opens the **Select Plots** dialog box, where you can select the report plot(s) you want to include.

Remove Data Source

removes the selected data source from the **Data Source Names** list. This also removes any curves associated with that file.

Data Source Names

lists the files and plots that you have loaded.

Data Sets

lists the available data sets for files and plots (typically `.xy`) that contain two columns monitoring the same value at different locations. You can select which data sets you want to plot by selecting/de-selecting the listed items.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Variables

lists X and Y variables for the selected file.

X Axis Variable

lists the variables that you can select for the X axis. The highlighted X variable will be added to the **Curve Information** list in coordination with the selected **Y Axis Variables**. Changing the selected **X Axis Variable** updates all the related curves shown in the **Curve Information** list.

Y Axis Variables

lists the variables that you can select for the Y axis. The highlighted Y variables will be added to the **Curve Information** list in coordination with the selected **X Axis Variable**. Changing the selected **Y Axis Variables** updates how many curves are shown in the **Curve Information** list.

Curves

lists what items will be plotted and how they will be labeled in the legend.

Curve Information

lists the curves that will be plotted.

Information about each curve is shown in the following order:

1. The name of the file where the data originated.
2. [2 column file (typically `.xy`) only] The location on the model where the data originated.
3. X Variable.
4. Y Variable.

Legend Names

lists the name for each curve that will be listed in the legend when the plot is displayed in the graphics window. (see **Change Legend Entry** to learn how to change the legend name for a curve).

Remove

removes the selected curve from the **Curve Information** list.

Change Legend Entry

allows you to change the name that will appear in the plot legend in the graphics window for a particular curve.

To use:

1. Select a name in the **Legend Names** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

2. Enter the new name in the text entry box to the right of the **Change Legend Entry** button.

3. Click **Change Legend Entry**.

Plot

contains text entry boxes for the various plot labels.

Title

lets you enter a title for the plot.

Legend Label

lets you enter a title for the legend.

X Axis Label

lets you label the X axis.

Y Axis Label

lets you label the Y axis.

Plot (button)

click **Plot** to plot the data listed in the **Curve Information** list.

Axes... (button)

opens the **Axes** dialog box, which allows you to customize the plot axes.

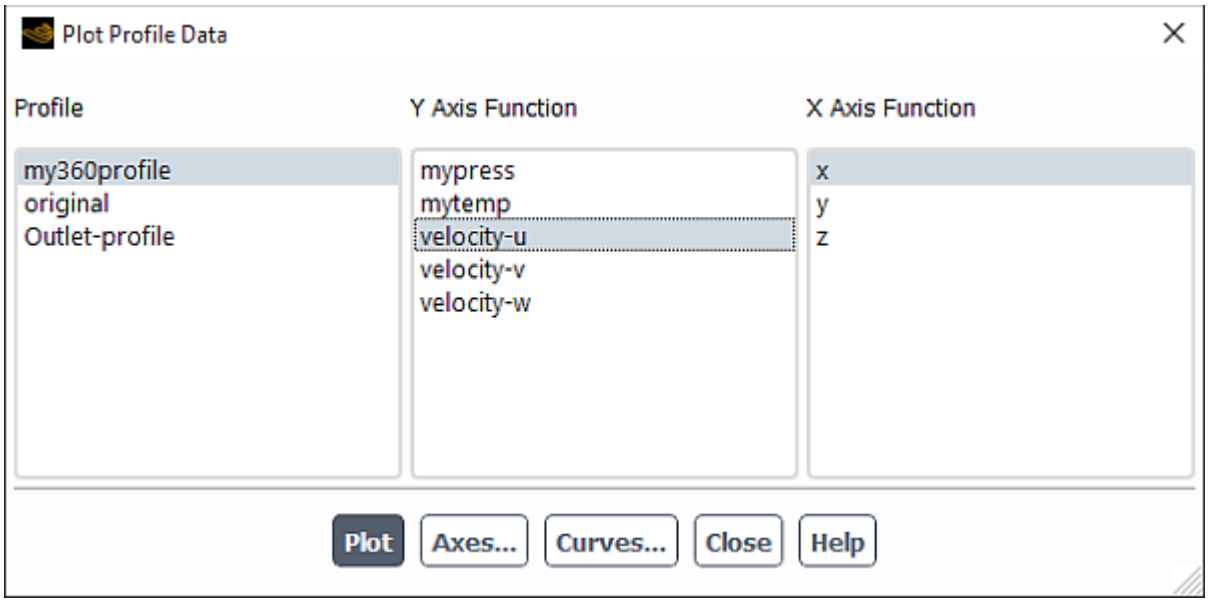
Curves... (button)

opens the **Curves** dialog box, which allows you to customize the curves used in the XY plot.

50.19.4. Plot Profile Data Dialog Box

The **Plot Profile Data** dialog box allows you to display an XY plot of the original data points of a boundary profile before it is interpolated onto the cell faces of a boundary. See Steps for Generating Plots of Profile Data (p. 4033) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Profile

contains a selectable list of available profiles. When a profile is selected its available fields are displayed under **Y Axis Function**.

Y Axis Function

contains a selectable list of the fields available in the selected profile that can be used for the y axis of the plot.

X Axis Function

contains a selectable list of the variables that can be used for the x axis of the plot.

Plot

displays an XY plot of the data points from the selected profile.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

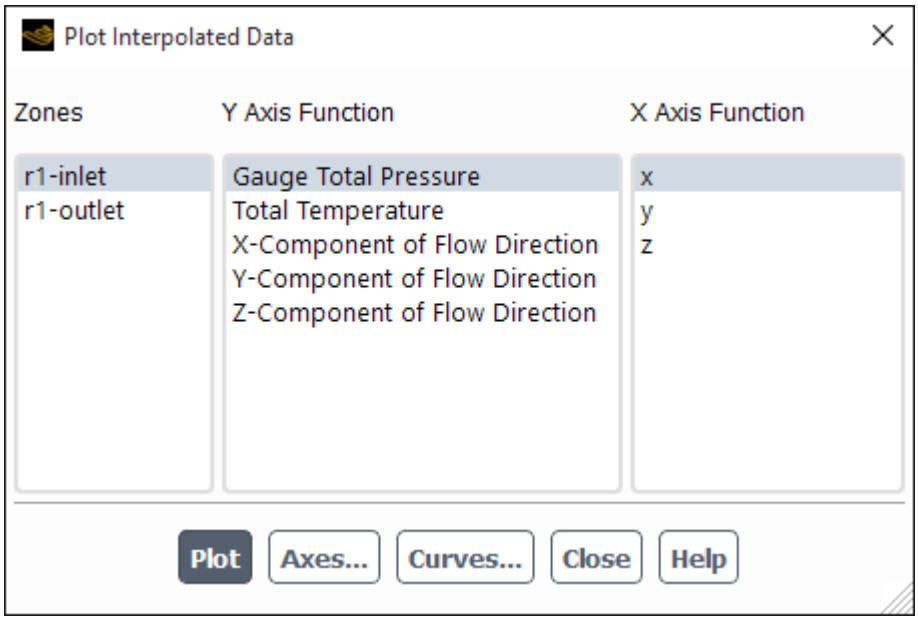
Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the XY plot.

50.19.5. Plot Interpolated Data Dialog Box

The **Plot Interpolated Data** dialog box allows you to display an XY plot of the values assigned to the cell faces when a profile file has been interpolated on a boundary. See Steps for Generating Plots of Interpolated Profile Data (p. 4034) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zones

contains a selectable list of the zones for which a profile field has been set as one or more of the parameters are displayed under **Y Axis Function**.

Y Axis Function

contains a selectable list of the profile-related parameters in the selected zone that can be used for the y axis of the plot. The name of the parameter will be the same as that of the drop-down list in the boundary condition dialog box from which the profile field was selected.

X Axis Function

contains a selectable list of the geometry variables that can be used for the x axis of the plot.

Plot

displays an XY plot of the cell face values (as interpolated from the data points of the profile file) of the selected zone.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

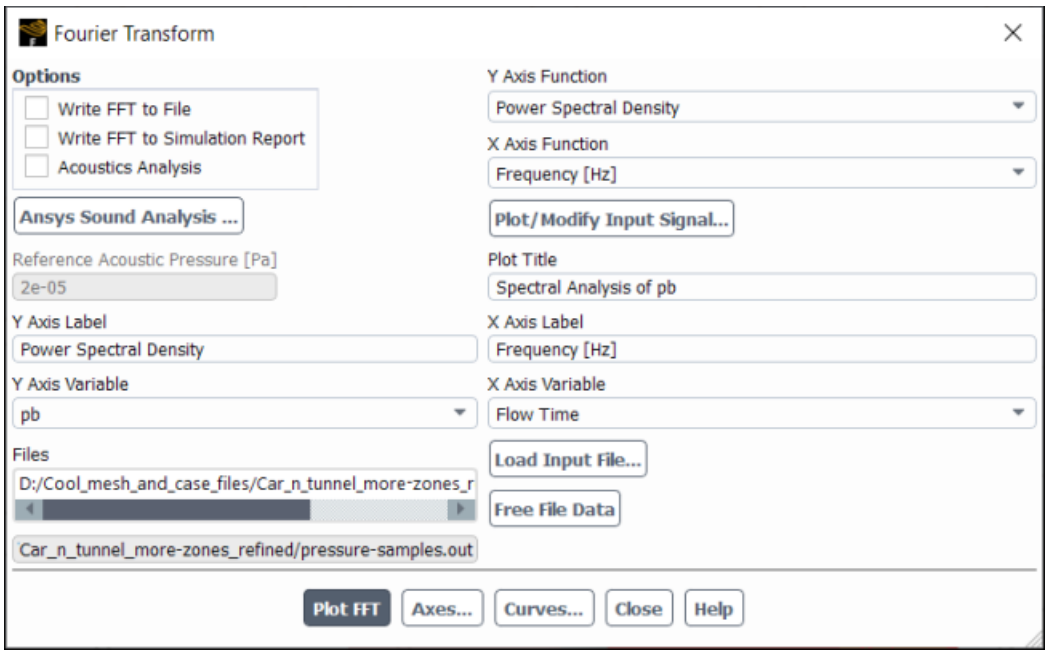
Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the XY plot.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.19.6. Fourier Transform Dialog Box

The **Fourier Transform** dialog box allows you to analyze your time dependent data using the Fast Fourier Transform (FFT) algorithm. See Fast Fourier Transform (FFT) Postprocessing (p. 4045) for details about the items below.



Controls

Options

lets you write the FFT data to a file or display the FFT data in a graphics window.

Write FFT to File

allows you to write out the FFT data directly to a file. When selected, the **Plot FFT...** buttons becomes the **Write FFT...** button.

Acoustics Analysis

enables the acoustics-relevant spectrum options (sound pressure level spectra and frequency band charts), and specifies that the overall sound pressure level is calculated and displayed in the console when you plot or write the FFT data. All dB-measured quantities are based on the **Reference Acoustic Pressure**.

Ansys Sound Analysis...

opens the Ansys Sound Analysis Dialog Box (p. 5250).

Process Options

contains options to analyze signal data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Process Receiver

allows you to analyze receiver data stored in memory.

Process File Data

allows you to analyze signal data from an existing input file.

Y Axis Function

contains a list from which you can select the function for the y axis.

X Axis Function

contains a list from which you can select the function for the x axis.

Receiver

contains a list of receivers from which you can select when the **Process Receiver** option is enabled.

Plot/Modify Input Signal...

opens the Plot/Modify Input Signal Dialog Box (p. 5255), which you can use to plot the input signal, as well as customize the data set and define spectrum smoothing in preparation for applying the FFT algorithm.

Reference Acoustic Pressure

allows you to specify the reference acoustic pressure (for example, p_{ref} in Equation 39.15 (p. 4053)) used to calculate the dB-measured quantities when the **Acoustics Analysis** option is enabled.

Plot Title

lets you create a new title or edit the original title for the FFT plot. By default, Ansys Fluent adds the string "Spectral Analysis of" to the title originally applied to the input signal plot.

Y Axis Label

allows you to create a new y axis label or edit the original y axis label. By default, the **Y Axis Label** corresponds to the selection in the **Y Axis Function** drop-down list.

X Axis Label

allows you to create a new x axis label or edit the original x axis label. By default, the **X Axis Label** corresponds to the selection in the **X Axis Function** drop-down list.

Y Axis Variable

if your input report file contains multiple report definitions, this allows you to specify the y axis variable.

X Axis Variable

if your input report file contains multiple report definitions, this allows you to specify the x axis variable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Files

lists the loaded input signal data files.

Load Input File...

loads an input signal data file into Ansys Fluent for FFT analysis. The input file is listed under **Files**.

Free File Data

removes data from FFT analysis once the input signal data file is selected in the **Files** list.

Plot FFT

displays the FFT data in a graphic window and, if **Acoustics Analysis** is enabled, calculates the overall sound pressure level in dB (based on the **Reference Acoustic Pressure**) and displays it in the console. If the **Write FFT to File** option is selected, then this button becomes the **Write FFT** button, which opens a file selection dialog box so that you write the FFT data to a file.

Write FFT

opens The Select File Dialog Box (p. 907) in which you can specify a name and save the FFT data to a file. If **Acoustics Analysis** is enabled, the overall sound pressure level will be calculated in dB (based on the **Reference Acoustic Pressure**) and displayed in the console at this time. If the **Write FFT to File** option is selected, then the **Plot FFT** button changes to the **Write FFT** button.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

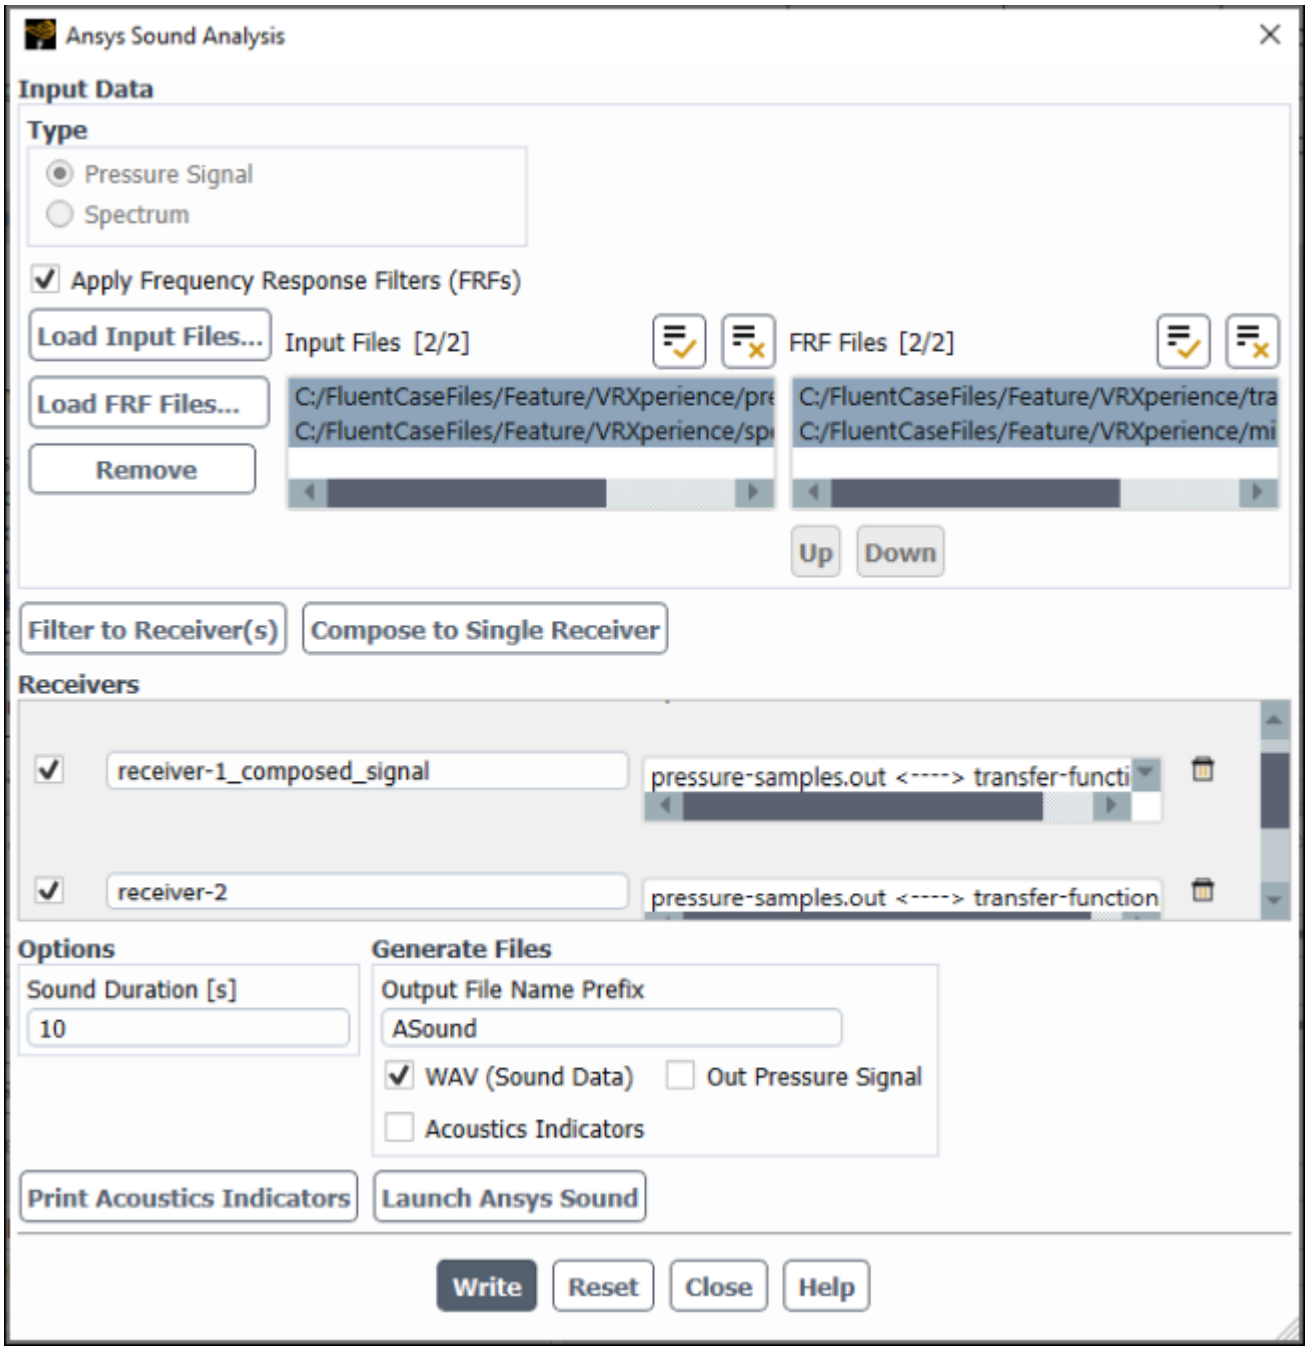
Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the plot.

50.19.7. Ansys Sound Analysis Dialog Box

Refer to Performing an Ansys Sound Analysis (p. 4056) for additional information on this dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Input Data

Pressure Signal

specifies that the input file you select is an acoustic pressure file (two column file of time vs. pressure).

Spectrum

specifies that the input file you select is an FFT output file (two column file of frequency vs. power spectral density).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Apply Frequency Response Filters (FRFs)

allows you to load a frequency response filter (FRF) file.

Load Input Files...

allows you to read in either a pressure data or spectrum input file.

Load FRF Files...

allows you to read in frequency response filter files.

Remove

removes the selected file from the **Input Files** and **FRF Files** lists.

Input Files

lists the loaded input pressure signal or spectrum files.

FRF Files

lists the loaded frequency response filter (FRF) files.

Up

moves the selected FRF file up in the list.

Down

moves the selected FRF file down in the list.

Filter to Receiver(s)

adds one or more receivers (based on the number of selected files) that are mapped with one input file and one frequency response filter file per receiver to the **Receivers** list. *For example, you could have 3 input files and 3 FRF files selected and this would result in 3 new receivers. You could also have 1 input file selected and 3 FRF files selected, which would also result in 3 new receivers.*

Compose to Single Receiver

combines the selected input files and corresponding FRF files into a single receiver that gets added to the **Receivers** list.

Receivers

lists the defined receivers and their comprising input and FRF files, with arrows indicating how they correspond.

Active

indicates whether the receiver is active. That is, whether or not the receiver will be included or evaluated when you click any of the following buttons: **Print Acoustic Indicators**, **Launch Ansys Sound**, **Write**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

displays the (editable) name of each defined receiver.

Input Files <---> FRF Files

displays the input and FRF files included within a receiver. The arrow indicates which input file is modified by which FRF file.

Options

Sound Duration

specifies the length of the sound clip for saving a WAV file.

Generate Files

Output File Name Prefix

specifies the name (aside from the extension) for any files saved when you click **Write**.

WAV (Sound Data)

specifies that a WAV sound file will be written when you click **Write**.

Out Pressure Signal

specifies that a pressure signal file will be written when you click **Write**.

Acoustic Indicators

specifies that a file containing the computed acoustic indicators will be written when you click **Write**.

Print Acoustic Indicators

computes the acoustic indicators for the selected files and prints them to the console.

Launch Ansys Sound

launches Ansys Sound and loads the defined receivers.

Write

computes the acoustic indicators for the selected files and prints them to the console.

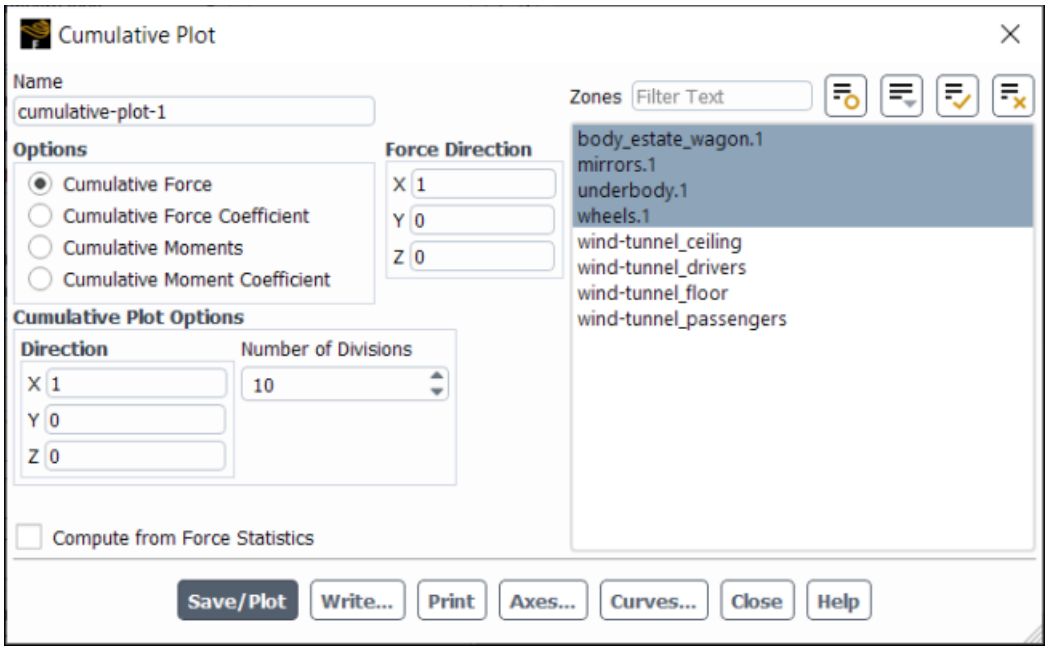
Reset

clears all settings and default changes from the dialog box.

50.19.8. Cumulative Plot Dialog Box

The **Cumulative Plot** dialog box allows you to analyze the development of force, moments, or coefficients for your model in the any desired location or direction. See Cumulative Force, Moment, and Coefficients Plots (p. 4061) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

name of the cumulative plot object.

Options

lets you select which type of plot to display.

Cumulative Force

displays the force development for the specified direction and walls.

Cumulative Force Coefficient

displays the force coefficient development for the specified direction and walls.

Cumulative Moments

displays the moment development for the specified direction and walls.

Cumulative Moment Coefficient

displays the moment coefficient development for the specified direction and walls.

Cumulative Plot Options

contains options to specify the direction and number of divisions where Fluent will calculate and plot the selected variable.

Direction

allows you to specify the direction along which the cumulative force or moments will be computed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Divisions

specifies the number of slices across the selected wall zones where the force or moments will be evaluated for the resulting cumulative plot. The planes will be created perpendicular to the **Direction**.

Compute from Force Statistics

use averaged values computed from force statistics instead of the default instantaneous values.

Force Direction

(**Cumulative Force** and **Cumulative Force Coefficient** only) allows you to specify the force component direction.

Moment Center

(**Cumulative Moments** and **Cumulative Moment Coefficient** only) allows you to specify the coordinates of the moment center.

Moment Axis

(**Cumulative Moments** and **Cumulative Moment Coefficient** only) allows you to specify the coordinates of the moment axis.

Zones

lists the zones that you can select for the cumulative plot.

Save/Plot

saves the cumulative plot object and plots the cumulative force, force coefficient, moments, or moment coefficient.

Write...

opens The Select File Dialog Box (p. 907), allowing you to save the plot data to a file.

Print

prints the value of the force or moment at each division to the console.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

Curves...

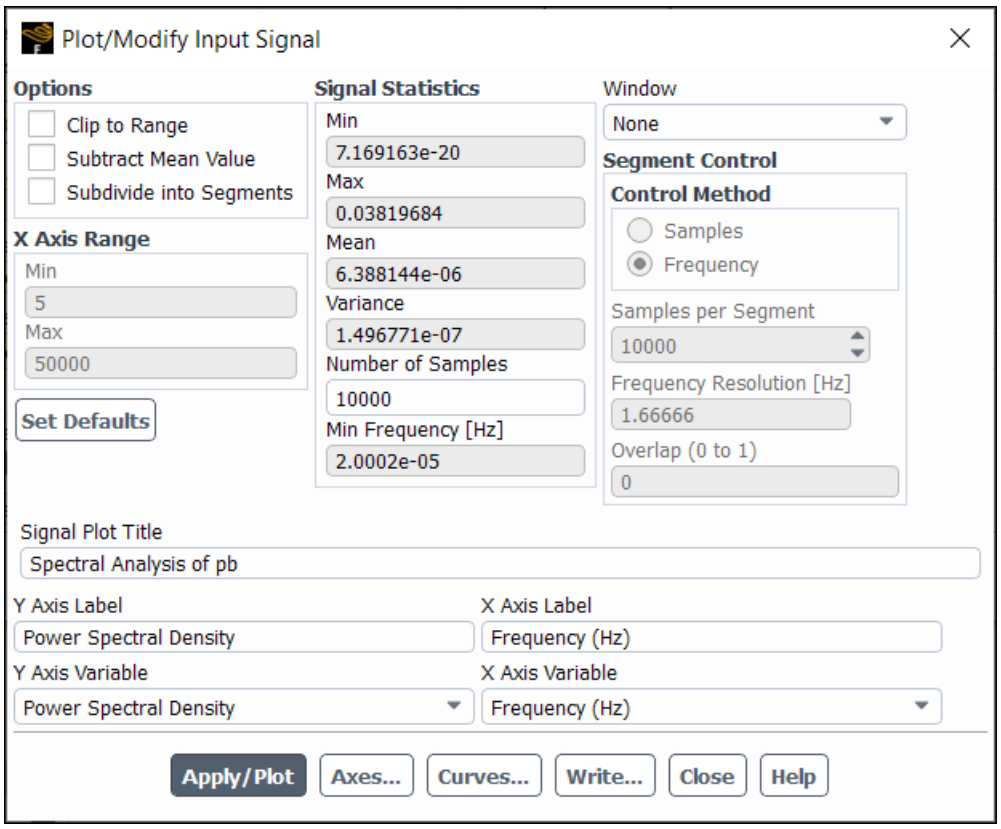
opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the plot.

50.19.9. Plot/Modify Input Signal Dialog Box

The **Plot/Modify Input Signal** dialog box allows you to plot the input signal, as well as customize the data set and define spectrum smoothing in preparation for applying the FFT algorithm. It is

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

opened from the Fourier Transform Dialog Box (p. 5248). See Using the FFT Utility (p. 4048) for details about the items below.



Controls

Options

allows you to process some or all of the input signal data.

Clip to Range

allows you to analyze a portion of the input signal by specifying data range.

Subtract Mean Value

reduces y axis quantities by the mean value of the relevant signal property.

Subdivide into Segments

enables / disables spectrum smoothing, which can suppress spurious amplitude fluctuations in the Fourier spectrum by splitting the input signal into multiple overlapping segments, so that Ansys Fluent can apply the FFT algorithm on each segment and then average the resulting spectra. The spectrum smoothing is controlled by the settings in the **Segment Control** group box. See Customizing the Input and Defining the Spectrum Smoothing (p. 4050) for further details.

Signal Statistics

displays signal information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min

displays the minimum value for the input signal.

Max

displays the maximum value for the input signal.

Mean

displays the average value for the input signal.

Variance

displays the variance for the input signal.

Number of Samples

displays the total number of samples in the input signal data set.

Min Frequency

displays the finest possible frequency resolution for the input signal.

X Axis Range

allows for a portion of the input signal to be analyzed when the **Process the whole data** option is turned off.

Min

specifies a minimum value for the x axis.

Max

specifies a maximum value for the x axis.

Set Defaults

resets the x axis minimum and maximum values to their original value and turns on the **Process the whole data** option.

Signal Plot Title

lets you create a new title or edit the original title for the input signal plot. By default, the **Signal Plot Title** corresponds with the title originally applied to the input signal plot.

Y Axis Label

allows you to create a new y axis label or edit the original y axis label. By default, the **Y Axis Label** corresponds with the y axis label originally applied to the input signal plot.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X Axis Label

allows you to create a new x axis label or edit the original x axis label. By default, the **X Axis Label** corresponds with the x axis label originally applied to the input signal plot.

Y Axis Variable

if your input report file contains multiple report definitions, this allows you to specify the y axis variable.

X Axis Variable

if your input report file contains multiple report definitions, this allows you to specify the x axis variable.

Window

lets you specify a windowing technique to remove discontinuities in the FFT calculation.

None

applies no windowing technique. This is the default setting.

Hamming

applies the Hamming technique.

Hanning

applies the Hanning technique.

Bartlett

applies the Bartlett technique.

Blackman

applies the Blackman technique.

Segment Control

provides settings that control the spectrum smoothing when **Subdivide into Segments** is enabled.

Control Method

allows you to specify how you want to define the segment size from the following:

Samples

bases the segment size on the **Samples per Segment**.

Frequency

bases the segment size on the **Frequency Resolution** Δf in Hertz units.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Samples per Segment

defines the number of samples in each segment when **Samples** is selected from the **Control Method** list.

Frequency Resolution

defines the desired frequency resolution Δf in Hertz units when **Frequency** is selected from the **Control Method** list.

Overlap

ranges from 0 to 1 and defines how much adjacent segments overlap. This setting is applicable regardless of which **Control Method** you select.

Apply/Plot

applies any changes you have made in the dialog box and displays the input signal data in a graphics window.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the plot axes.

Curves...

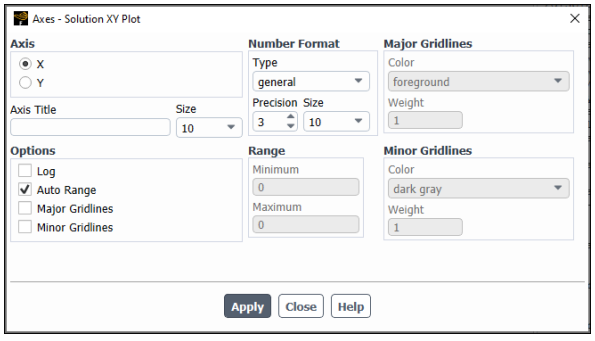
opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the plot.

Write...

opens The Select File Dialog Box (p. 907), in which you can save the signals to a file.

50.19.10. Axes Dialog Box

The **Axes** dialog box allows you to independently control the characteristics of the ordinate and abscissa on an XY plot or histogram. You can change the titles, scale, range, number format, and major and minor rules visibility and appearance. Note that the title following **Axes** in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that Ansys Fluent can generate. See Using the Axes Dialog Box (p. 4042) for details about the items below.



Controls

Axis

contains check buttons that allow you to set abscissa (x-axis) or ordinate (y-axis) characteristics.

X

allows you to specify the abscissa characteristics.

Y

allows you to specify the ordinate characteristics.

Axis Title

defines the character string that will label the active axis (the one selected in **Axis**) in the display.

Size

specifies the font size of the **Axis Title**.

Options

contains check buttons that (de)activate scale, range, major rules, and minor rules.

Log

toggles logarithmic scaling of the active axis. By default, decimal scaling is used.

Auto Range

toggles automatic computation of the range of the active axis. If you deactivate this option, you may input the **Minimum** and **Maximum** values in the **Range** box.

Major Rules

toggles the display of major rules on the active axis. Major rules are the horizontal or vertical lines that mark the primary data divisions and span the whole plot window to produce a "grid."

Minor Rules

toggles the display of minor rules on the active axis. Minor rules are the horizontal or vertical lines that mark the secondary data divisions and span the whole plot window to produce a "grid."

Number Format

contains controls for changing the format of the data labels on the active axis. Data labels are the character strings used to define the primary data divisions on the axes.

Type

sets the form of the data labels. You may select from a drop-down list of options, including the following:

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

general

displays the real value with either float or exponential form based on the size of the number and the defined **Precision**.

float

displays the real value with an integral and fractional part (for example, 1.0000), where the number of digits in the fractional part is determined by **Precision**.

exponential

displays the real value with a mantissa and exponent (for example, 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by **Precision**.

Precision

defines the number of fractional digits displayed in the data labels.

Size

specifies the size of the font used for the data labels.

Range

contains the range or extents of the active axis. To set the range manually, you must turn off **Auto Range**. Otherwise the extents are computed automatically.

Minimum

sets the minimum data value for the active axis.

Maximum

sets the maximum data value for the active axis.

Major Rules

contains controls for modifying the appearance of the major rules. To use these controls you must activate **Major Rules** in the **Options** list.

Color

sets the color of the major rules from a drop-down list with numerous color selections.

Weight

sets the line thickness of the major rule. A line of weight 1.0 is normally 1 pixel wide. A weight of 2.0 would make the line twice as thick (2 pixels wide).

Minor Rules

contains controls for modifying the appearance of the minor rules. To use these controls you must activate **Minor Rules** in the **Options** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Color

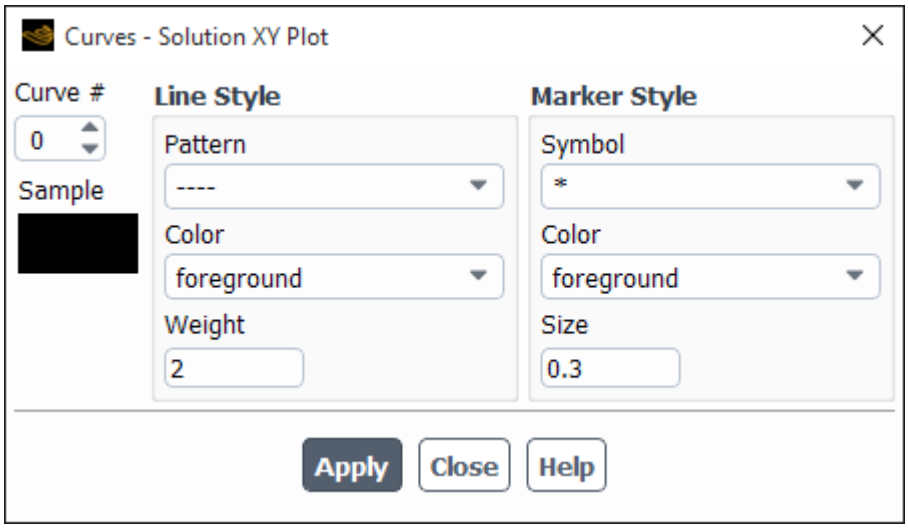
sets the color of the minor rules from a drop-down list with numerous color selections.

Weight

sets the line thickness of the minor rule. A line of weight 1.0 is 1 pixel wide. A weight of 2.0 would make the line twice as thick (2 pixels wide).

50.19.11. Curves Dialog Box

The **Curves** dialog box allows you to modify the appearance of the lines and markers used in XY plots. Note that the title following **Curves** in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that Ansys Fluent can generate. See Using the Curves Dialog Box (p. 4044) for details about the items below.



Controls

Curve #

defines the active curve number. The present and future marker and line styles apply to the defined curve number. The curves are numbered sequentially, starting from 0. For example, if you were plotting flow-field values on two zones, the first zone would be curve 0, and the second, curve 1. If the plot contains only one curve, the **Curve #** is set to 0 and is not editable.

Sample

displays a single marker and line with the current style attributes.

Line Style

contains controls for modifying the appearance of the active curve.

Pattern

sets the pattern of the active curve. A drop-down list allows you to set the line pattern. Except for **center** and **phantom** lines, the list displays examples of the pattern choices. A **center** line

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

alternates a very long dash and a short dash and a **phantom** line alternates a very long dash and a double short dash.

Color

sets the color of the active curve. A drop-down list allows you to select from a list of color names.

Weight

sets the thickness of the active curve. A line weight of 1.0 is normally 1 pixel wide. Therefore, a weight of 2.0 would make the line twice as thick (2 pixels wide).

Marker Style

contains controls for modifying the appearance of the active curve's marker.

Symbol

sets the symbol used to mark data. You can select the symbol from a drop-down list that contains all the symbol choices. The **Sample** box will allow you to experiment with various markers. For example, in plotting pressure-coefficient data on the upper and lower surfaces of an airfoil, the symbol `/*\` (filled-in upward-pointing triangle) could be used for the marker representing the upper surface data, and the symbol `\*/` (filled-in downward-pointing triangle) could be used for the marker representing the lower surface data.

Color

sets the color of the marker on the active line number. A drop-down list allows you to select from a list of color names.

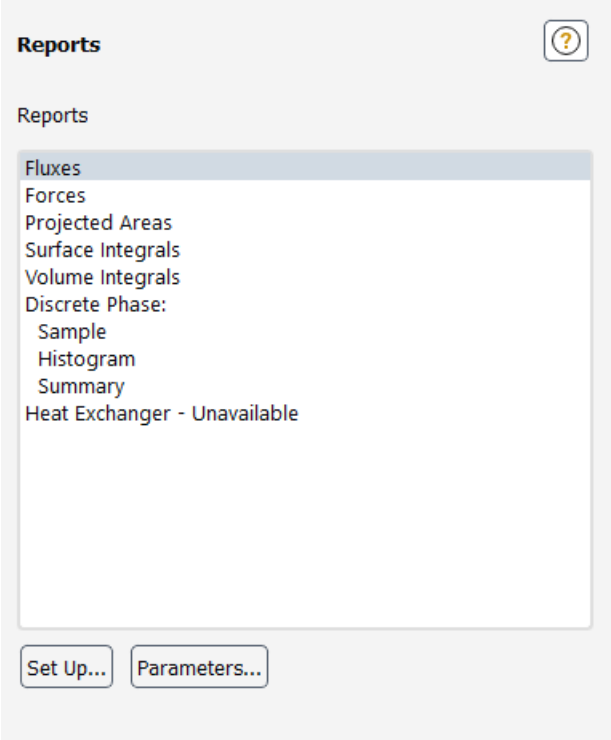
Size

sets the size of the data marker. A symbol of size 1.0 is 3.0% of the height of the display screen, except for the "." symbol, which is always one pixel.

50.20. Reports Task Page

The **Reports** task page allows you to set up reports for your CFD simulation. Reports can be compiled for fluxes, forces, projected areas, surface and volume integrals, among others. See Reporting Alphanumeric Data (p. 4063) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reports

displays a list of available report types in Ansys Fluent.

You can double-click an item in the **Reports** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Fluxes

selecting this item and clicking the **Set Up...** button opens the Flux Reports Dialog Box (p. 5266).

Forces

selecting this item and clicking the **Set Up...** button opens the Force Reports Dialog Box (p. 5268).

Projected Areas

selecting this item and clicking the **Set Up...** button opens the Projected Surface Areas Dialog Box (p. 5270).

Surface Integrals

selecting this item and clicking the **Set Up...** button opens the Surface Integrals Dialog Box (p. 5271).

Volume Integrals

selecting this item and clicking the **Set Up...** button opens the Volume Integrals Dialog Box (p. 5275).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Phase

allows you to report on one of the following three report types:

Sample

selecting this item and clicking the **Set Up...** button opens the Sample Trajectories Dialog Box (p. 5277).

Histogram

selecting this item and clicking the **Set Up...** button opens the Trajectory Sample Histograms Dialog Box (p. 5279).

Summary

selecting this item and clicking the **Set Up...** button opens the Particle Summary Dialog Box (p. 5282).

Heat Exchanger

selecting this item and clicking the **Set Up...** button opens the Heat Exchanger Report Dialog Box (p. 5283).

Set Up...

opens the dialog box corresponding to the selected item in the **Reports** list.

Parameters...

opens the Parameters Dialog Box (p. 5284).

For additional information, see the following sections:

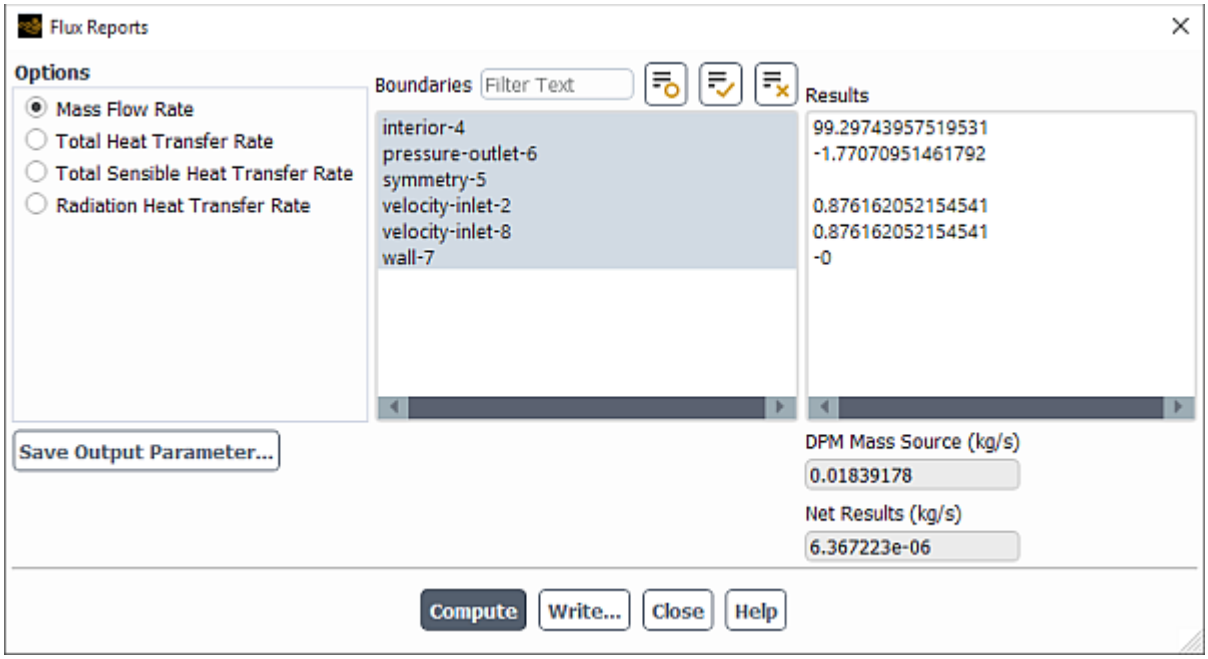
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.20.1. Flux Reports Dialog Box

The **Flux Reports** dialog box allows you to compute the mass flow rate, heat transfer rate, and radiation heat transfer rate on selected boundary zones. See Fluxes Through Boundaries (p. 4101) for details.



Controls

Options

contains the following option buttons:

Mass Flow Rate

specifies that the mass flow rate is computed for the selected boundary zones.

Total Heat Transfer Rate

specifies that the total heat transfer rate is computed for the selected boundary zones.

Total Sensible Heat Transfer Rate

specifies that the total sensible heat transfer rate is computed for the selected boundary zones. It reports the total energy flux as defined in Equation 5.5 in the Theory Guide.

Radiation Heat Transfer Rate

specifies that the radiation heat transfer rate is computed for the selected boundary zones.

Pressure Work Rate

specifies that the pressure work rate is computed for the selected boundary zones. This rate is the energy transfer due to pressure when a fluid zone undergoes normal zone motion relative to an adjacent solid zone (for further details, see Equation 26.1 in the Theory Guide). This pressure work is on the fluid side only, not on the solid side. This option is only available

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

when the energy equation is enabled, the absolute velocity formulation is selected, and the **Frame Motion** and/or **Mesh Motion** option is enabled in the **Fluid** dialog box.

Viscous Work Rate

specifies that the viscous work rate is computed for the selected boundary zones, which is the integral of the product of viscous stress with velocity over the external boundary of the domain with the boundary normal directed inside (for further details, see Equation 26.2 in the Theory Guide). Note that after reading case and data files into Ansys Fluent, the viscous work rate is zero. You need to run at least one iteration or time step to obtain the viscous work rate value. This item is available only when the energy equation is enabled and the pressure-based solver is selected.

Film Mass Flow Rate

specifies that the mass flow rate is computed for the selected boundary zone(s). This option is available only when the Eulerian wall film model is enabled.

Film Heat Transfer Rate

specifies that the film heat transfer rate is computed for the selected boundary zone(s). This option is available only when the Eulerian wall film model is enabled.

Electric Current Rate

specifies that the electric current rate is computed for the selected boundary zone(s). This option is available only if the potential equation is enabled—see Modeling Electric Potential Field and Electrochemistry Models (p. 3257).

Save Output Parameter...

opens the Save Output Parameter Dialog Box (p. 5291).

Boundaries

contains a selectable list of valid boundary zones for flux reporting.

Results

displays the results of the selected flux computation for each boundary zone selected. The summation of the individual zone flux results is displayed in the box below the **Results** list.

Compute

computes the flux for each of the selected boundary zones and updates **Net Results** (for example, in kg/s, W, and so on) and other reports, for example, **Heat of Reaction Source**.

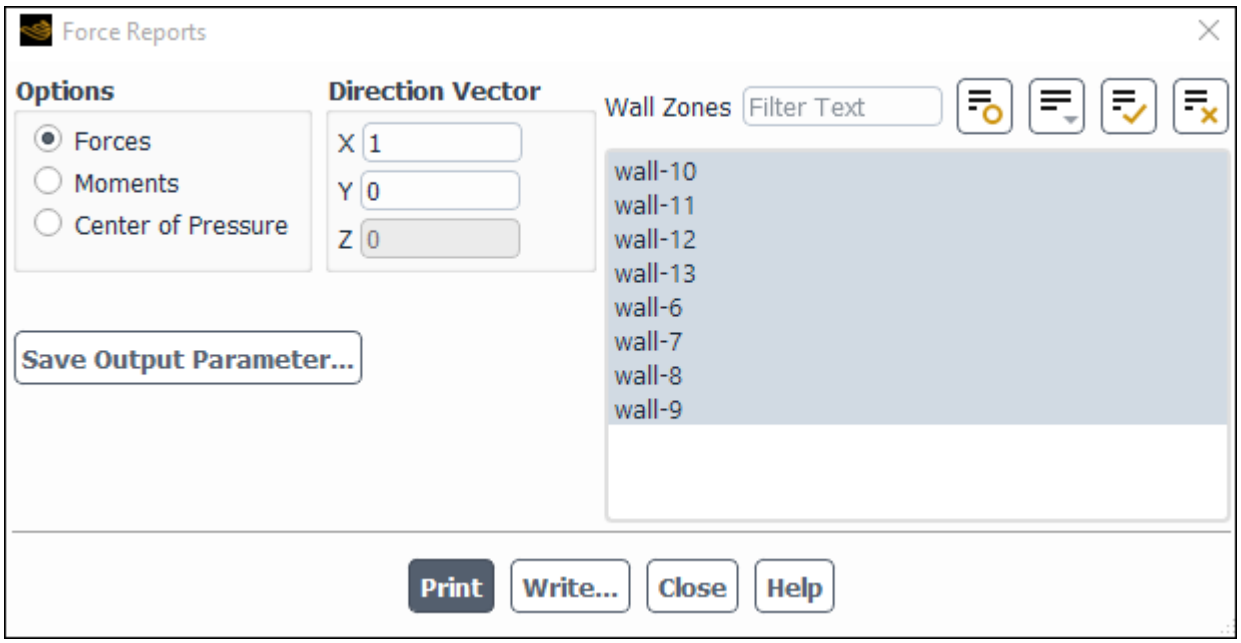
Write...

opens the **Select File** dialog box (The Select File Dialog Box (p. 907)), which you can use to save the reported values to a file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.20.2. Force Reports Dialog Box

The **Force Reports** dialog box allows you to compute the forces along a specified vector, moments about a specified center, and the coordinates of the center of pressure for selected wall zones. See Forces on Boundaries (p. 4111) for details.



Controls

Options

contains option buttons that control computation of the forces, moments, or center of pressure.

Forces

enables the computation of the pressure and viscous forces.

Moments

enables the computation of the pressure and viscous moments.

Center of Pressure

enables the computation of the coordinates about which the moment by pressure forces is zero.

Direction Vector

contains the components of the force vector. This label is visible when the **Forces** option button is active.

X,Y,Z

are the components of the force vector along which the forces will be computed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Moment Center

contains the Cartesian coordinates of the moment center. This label is visible when the **Moments** option button is active.

X,Y,Z

are the Cartesian coordinates of the moment center about which moments will be computed.

Moment Axis

contains the Cartesian coordinates of the moment axis. This label is visible when the **Moments** option button is active.

X,Y,Z

are the Cartesian coordinates of the moment axis about which moments will be computed.

Coordinate

contains the value of the Cartesian coordinate that is fixed. This label is visible when the **Center of Pressure** option button is active.

X,Y,Z

are the Cartesian coordinates, one of which will be fixed.

Value (n)

is the point where the selected Cartesian coordinate will be fixed.

Wall Zones

contains a selectable list of wall zones and porous zones (when applicable). The force or moment information is printed for each zone, and then a total force or moment for all the zones is presented.

Save Output Parameter...

opens the Save Output Parameter Dialog Box (p. 5291).

Print

displays (in the console) the pressure, viscous (if appropriate), and total forces or moments, and the pressure, viscous, and total force coefficients along the specified force vector or moment center for the selected wall zones. The center of pressure coordinates will print to the console when the **Center of Pressure** option is activated.

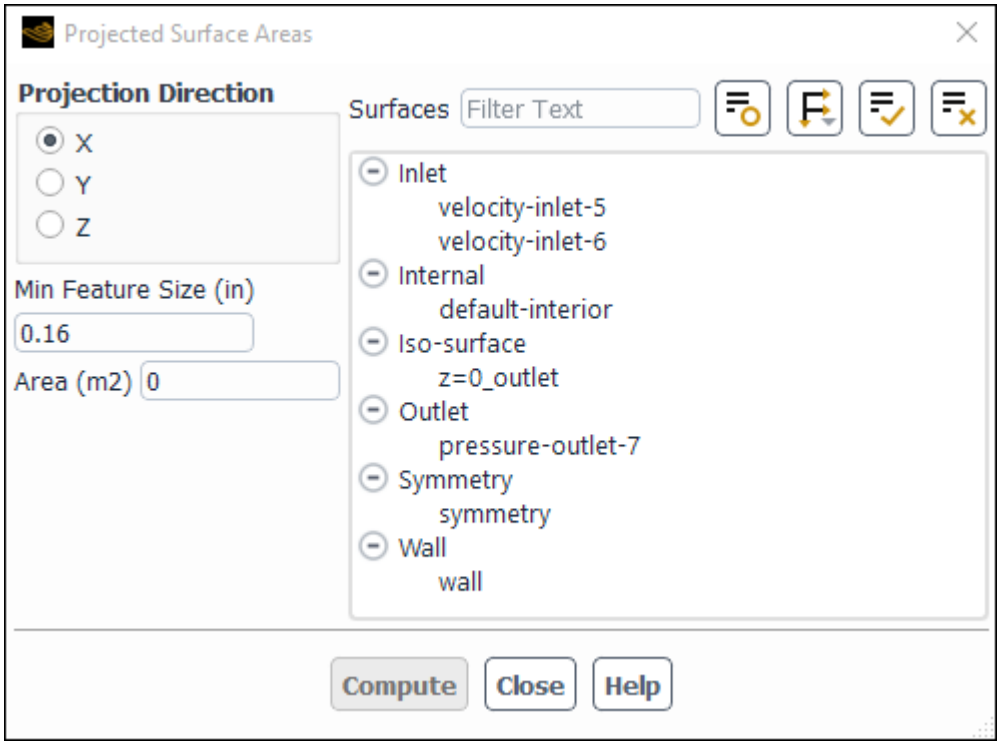
Write...

opens The Select File Dialog Box (p. 907), which you can use to save the reported values to a file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.20.3. Projected Surface Areas Dialog Box

The **Projected Surface Areas** dialog box allows you to compute an estimated area of the projection of selected surfaces along the x, y, or z axis. See Projected Surface Area Calculations (p. 4115) for details.



Controls

Projection Direction

indicates the direction along which to project the surface.

Min Feature Size

specifies the length of the smallest feature in the geometry that you want to resolve in the area calculation.

Area

displays the computed projected area.

Surfaces

contains a list of existing surfaces. You can select the surface(s) for which the projected area is to be calculated in this list.

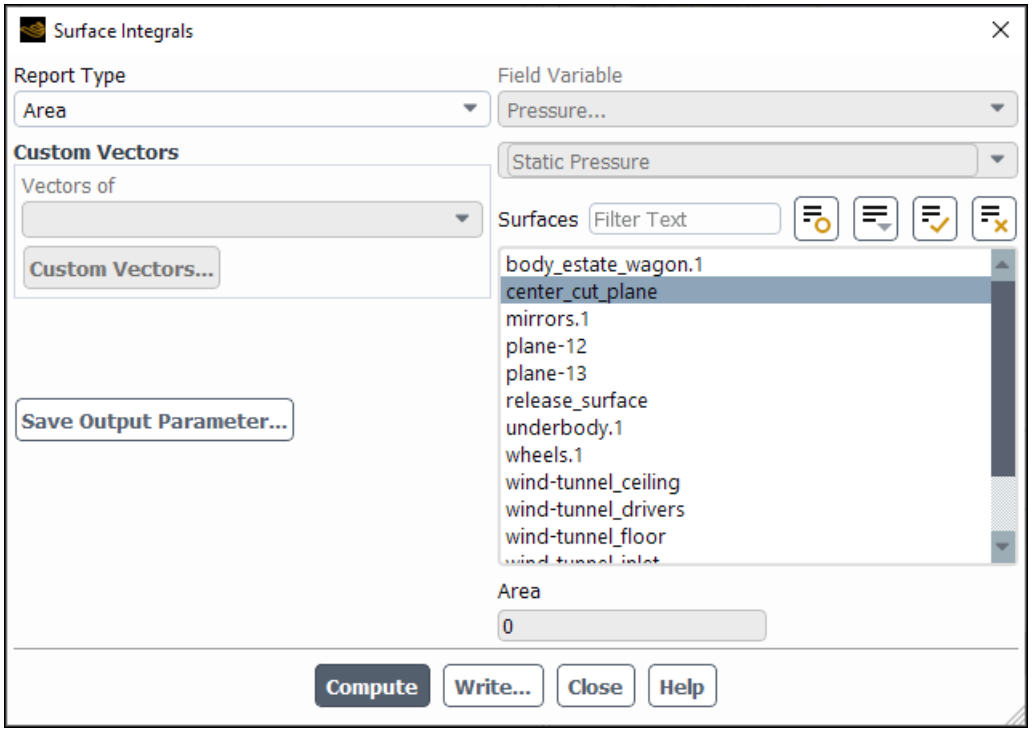
Compute

computes the area of the selected surfaces projected along the selected direction. The area will be printed in the **Area** box and in the console window.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

50.20.4. Surface Integrals Dialog Box

The **Surface Integrals** dialog box allows you to compute the area, mass and volume flow rate, standard deviation, integral, flow rate, area-weighted average, custom vector-based flux, custom vector flux, custom vector-weighted average, mass-weighted average, sum, facet average, facet minimum/maximum, uniformity index (weighted by area or mass), vertex average, or vertex minimum/maximum quantity of a specified field variable on a selected list of surfaces. See Surface Integration (p. 4116) for details.



Controls

Report Type

contains drop-down list that has options that control the method of surface integration.

Area

turns on the computation of the surface area.

Area-Weighted Average

turns on the computation of the area-weighted average on the surface(s).

Custom Vector Based Flux

turns on the computation of the vector-based flow rate of a quantity through the surface(s).

Custom Vector Flux

turns on the computation of the flow rate on a vector through the surface(s).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Custom Vector Weighted Average

turns on the computation of vector-weighted average of a quantity on the surface(s).

Facet Average

turns on the computation of the facet-averaged quantity on the surface(s).

Facet Minimum

turns on the computation of the facet minimum of a quantity on the surface(s).

Facet Maximum

turns on the computation of the facet maximum of a quantity on the surface(s).

Flow Rate

turns on the computation of the flow rate through the surface(s).

Integral

turns on the computation of the integral on the surface(s).

Mass Flow Rate

turns on the computation of the mass flow rate through the surface(s).

Mass-Weighted Average

turns on the computation of the mass-averaged quantity on the surface(s).

Standard Deviation

turns on the computation of the standard deviation of a specified field variable on a surface.

Sum

turns on the computation of the summed quantity on the surface(s).

Uniformity Index - Mass Weighted

turns on the computation of the mass-weighted uniformity index of a quantity on the surface(s).

Uniformity Index - Area Weighted

turns on the computation of the area-weighted uniformity index of a quantity on the surface(s).

Vertex Average

turns on the computation of the vertex-averaged quantity on the surface(s).

Vertex Minimum

turns on the computation of the vertex minimum of a quantity on the surface(s).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Vertex Maximum

turns on the computation of the vertex maximum of a quantity on the surface(s).

Volume Flow Rate

turns on the computation of the volume flow rate through the surface(s).

Custom Vectors

allows you to define custom vectors if you selected **Custom Vector Based Flux**, **Custom Vector Flux**, or **Custom Vector Weighted Average** from the **Report Type** drop-down list.

Field Variable

contains a list of the field variables that can be used in the surface integrations. This option is not active if the **Area**, **Mass Flow Rate**, or **Volume Flow Rate** option is active.

Surfaces

is a selectable list of surfaces.

Area

displays the result of the area summation over all the selected surfaces. This label is visible when **Area** is active.

Area-Weighted Average

displays the result of the area-weighted average computation over all the selected surfaces. This label is visible when **Area-Weighted Average** is active.

Average of Facet Values

displays the result of the facet-averaged computation over all the selected surfaces. This label is visible when **Facet Average** is active.

Minimum of Facet Values

displays the minimum facet value on all the selected surfaces. This label is visible when **Facet Minimum** is active.

Maximum of Facet Values

displays the maximum facet value on all the selected surfaces. This label is visible when **Facet Maximum** is active.

Flow Rate

displays the result of the flow rate computation over all the selected surfaces. This label is visible when **Flow Rate** is active.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Integral

displays the result of the integral computation over all the selected surfaces. This label is visible when **Integral** is active.

Mass Flow Rate

displays the result of the mass flow rate computation over all the selected surfaces. This label is visible when **Mass Flow Rate** is active.

Mass-Weighted Average

displays the result of the mass-averaged computation over all the selected surfaces. This label is visible when **Mass-Weighted Average** is active.

Standard Deviation

displays the result of the standard deviation computation over all the selected surfaces. This label is visible when **Standard Deviation** is active.

Sum of Facet Values

displays the result of the summation over all the selected surfaces. This label is visible when **Sum** is active.

Uniformity Index Mass-Wt.

displays the mass-weighted uniformity index value on all the selected surfaces. This label is visible when **Uniformity Index - Mass Weighted** is active.

Uniformity Index Area-Wt.

displays the area-weighted uniformity index value on all the selected surfaces. This label is visible when **Uniformity Index - Area Weighted** is active.

Average of Surface Vertex Values

displays the result of the vertex-averaged computation over all the selected surfaces. This label is visible when **Vertex Average** is active.

Minimum of Vertex Values

displays the minimum facet value on all the selected surfaces. This label is visible when **Vertex Minimum** is active.

Maximum of Vertex Values

displays the maximum facet value on all the selected surfaces. This label is visible when **Vertex Maximum** is active.

Volumetric Flow Rate

displays the result of the volumetric flow rate computation over all the selected surfaces. This label is visible when **Volume Flow Rate** is active.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Save Output Parameter...

opens the Save Output Parameter Dialog Box (p. 5291).

Compute

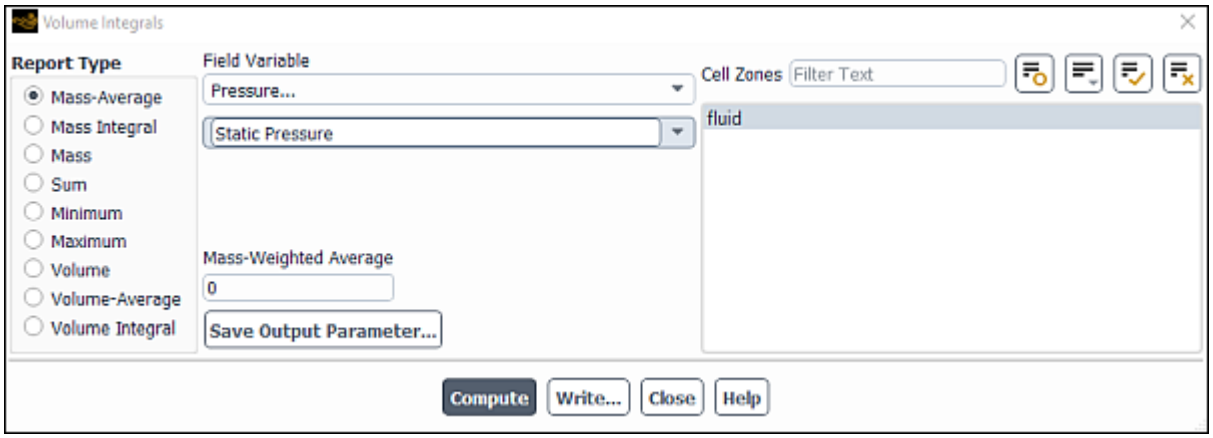
computes the specified integration on the selected surfaces.

Write...

opens The Select File Dialog Box (p. 907), which you can use to save the reported values to a file.

50.20.5. Volume Integrals Dialog Box

The **Volume Integrals** dialog box allows you to compute the volume, sum, maximum, minimum, volume integral, volume-averaged quantity, mass integral, or mass-averaged quantity of a specified field variable on a selected list of cell zones. See Volume Integration (p. 4119) for details.



Controls

Report Type

contains option buttons that control the method of volume integration.

Mass-Average

turns on the computation of the mass-averaged quantity on the cell zone.

Mass Integral

turns on the computation of the mass integral on the cell zone.

Mass

turns on the computation of the total mass in the cell zone for the selected phase.

Sum

turns on the computation of the summation over all cells in the selected zone.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sum*2Pi

computes the summation over all cells in the selected zone of a 2D axisymmetric model and multiplies the result by 2π to give the summation over the revolved domain. This option is only available in 2D axisymmetric cases.

Minimum

computes the minimum value of the selected variable at each cell in the selected zone.

Maximum

computes the maximum value of the selected variable at each cell in the selected zone.

Volume

turns on the computation of the cell zone volume.

Volume Integral

turns on the computation of the volume integral on the cell zone.

Volume-Average

turns on the computation of the volume-weighted average on the cell zone.

Field Variable

contains a list of the field variables that can be used in the sum, volume integral, and average computations. This option is not active if the **Volume** option is active.

Cell Zones

is a selectable list of cell zones.

Total Volume

displays the result of the volume computation over all the selected zones. This label is visible when **Volume** is active.

Sum

displays the result of the summation over all the selected zones. This label is visible when **Sum** is active.

Sum *2Pi

displays the result of the summation over all the selected zones multiplied by 2π. This label is visible when **Sum*2Pi** is active.

Max

displays the result of the maximum value of the selected zone(s). This label is visible when **Maximum** is active.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min

displays the result of the minimum value of the selected zone(s). This label is visible when **Minimum** is active.

Total Volume Integral

displays the result of the volume-integral computation over all the selected zones. This label is visible when **Volume Integral** is active.

Volume-Weighted Average

displays the result of the volume-averaged computation over all the selected zones. This label is visible when **Volume-Average** is active.

Total Mass-Weighted Integral

displays the result of the mass-integral computation over all the selected zones. This label is visible when **Mass Integral** is active.

Mass-Weighted Average

displays the result of the mass-averaged computation over all the selected zones. This label is visible when **Mass-Average** is active.

Save Output Parameter...

opens the Save Output Parameter Dialog Box (p. 5291).

Compute

computes the specified integration on the selected zones.

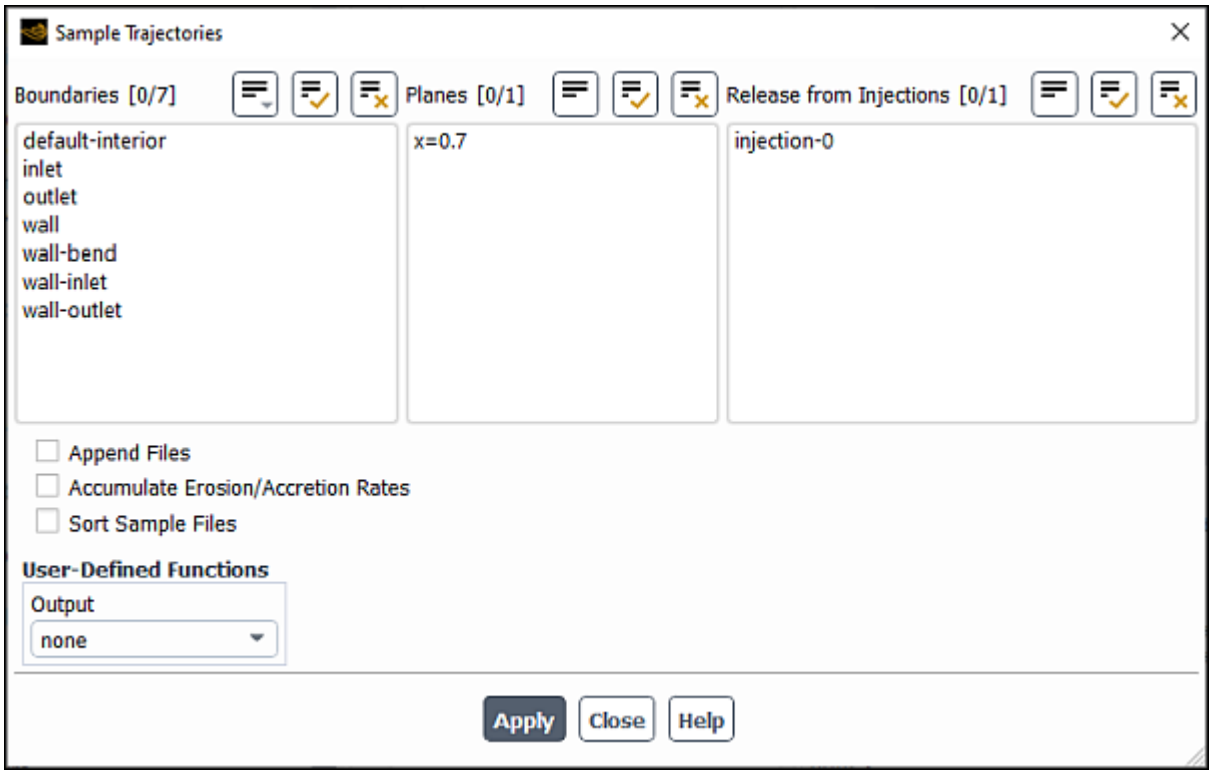
Write...

opens The Select File Dialog Box (p. 907), which you can use to save the reported values to a file.

50.20.6. Sample Trajectories Dialog Box

The **Sample Trajectories** dialog box allows the writing of particle states (position, velocity, diameter, temperature, and mass flow rate) at various boundaries and planes (lines in 2D). See Sampling of Trajectories (p. 2869) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Boundaries

lists boundaries that can be chosen as the surfaces at which samples will be written.

Lines

(in 2D) lists lines that can be chosen as the surfaces at which samples will be written.

Planes

(in 3D) lists planes that can be chosen as the surfaces at which samples will be written.

Release From Injections

lists injections from which the injection to be tracked is chosen.

Append Files

causes the results of multiple calculations to be appended to a single file.

Accumulate Erosion/Accretion Rates

causes erosion and accretion rates to be accumulated for repeated trajectory calculations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sort Sample Files

causes the sample files to be sorted by injection and particle ID for steady tracking or simulated time (`flow-time` in the 13th column) for unsteady tracking. The latter is required if the sample file is to be used as an unsteady injection file.

User-Defined Functions

allow control of the format and the information written for the sample output.

Output

contains a drop-down list of available user-defined functions.

Compute

causes the particles to be tracked and their status to be written to files when they encounter selected surfaces. This button will not appear for unsteady particle tracking.

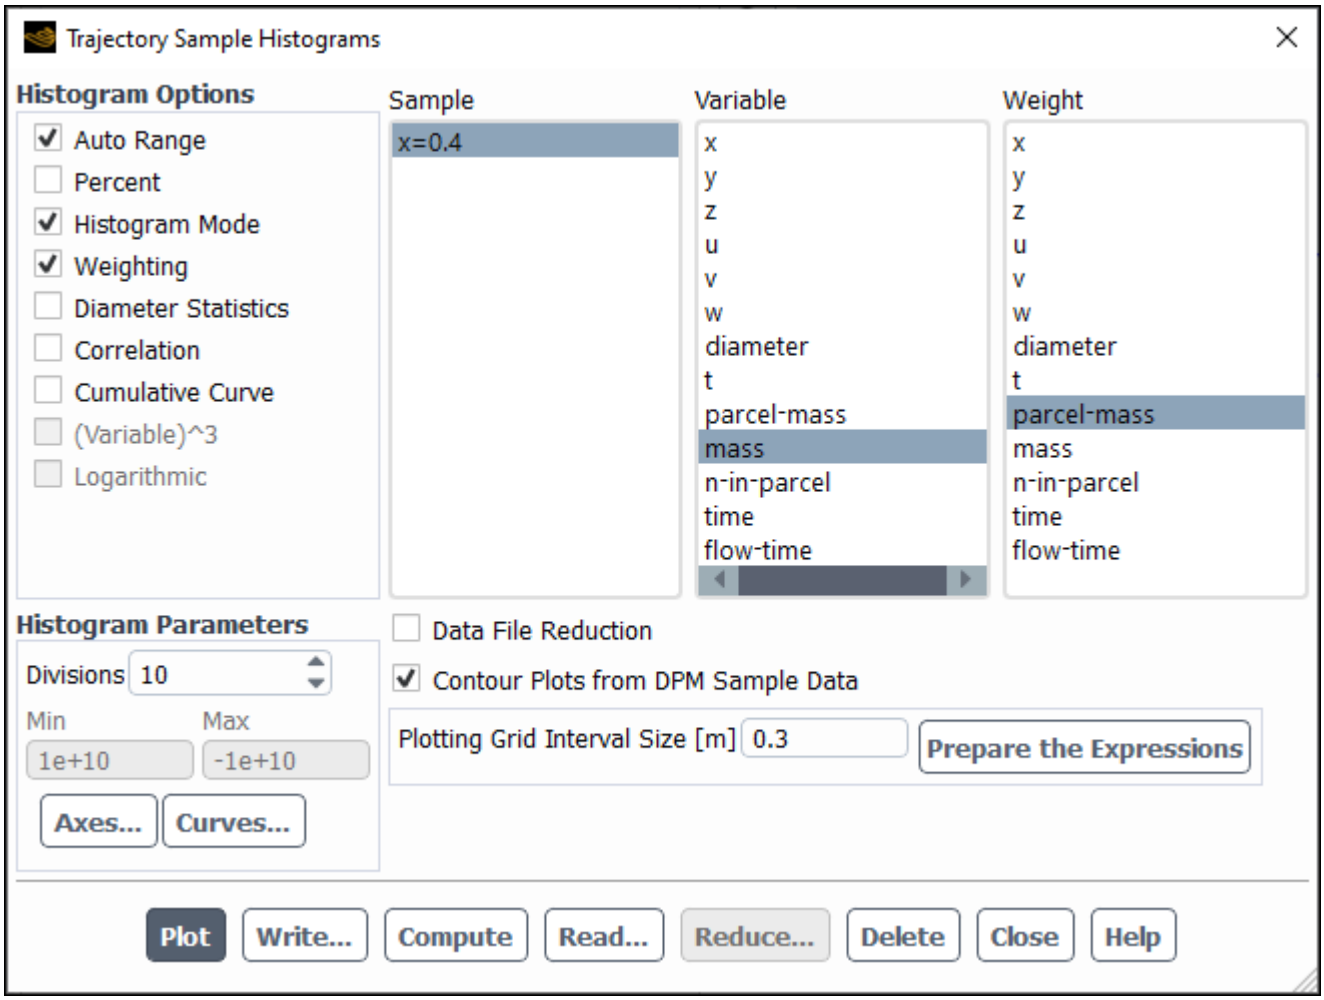
Start

initiates sampling for unsteady particle tracking. This button will replace the **Compute** button if you are performing unsteady particle tracking. After you click it, it will change to the **Stop** button. Click **Stop** to stop the sampling. (The label will change back to **Start**.)

50.20.7. Trajectory Sample Histograms Dialog Box

The **Trajectory Sample Histograms** dialog box allows the plotting of histograms from sample files created in the Sample Trajectories Dialog Box (p. 5277). See Histogram Reporting of Samples (p. 2870) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains check buttons for histogram options.

Auto Range

toggles between automatic and manual settings of the histogram range.

Percent

causes the plot to indicate the percent of particles. Deselecting this will result in the actual number of particles being plotted.

Histogram Mode

allows you to display the histogram with or without bars.

Weighting

allows you to apply a weight to the data sample.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Diameter Statistics

allows you to display a summary of diameter statistics for a selected variable in the console window.

Correlation

allows you to choose correlations between how one particle variable depends on another particle variable.

Cumulative Curve

allows you to compute a cumulative distribution curve for a selected variable.

(Variable^3)

allows you to plot the cumulative mass distribution for a constant particle density using the particle diameter.

Histogram Parameters

contains controls for histogram plotting.

Divisions

sets the number of "bins" in the histogram.

Min

displays the minimum value of the variable selected in the **Variable** list. If **Auto Range** is off, you can set the minimum by typing a new value.

Max

displays the maximum value of the variable selected in the **Fields** list. If **Auto Range** is off, you can set the maximum by typing a new value.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the histogram axes.

Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the histogram.

Sample

lists the data samples that have been read in.

Variable

lists the fields variables available in the selected sample.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scale, No. of Bins

is an informational list that displays the scaling and the number of bins for each variable in the selected sample. This list is displayed only if **Data File Reduction** is selected.

Weight

lists the weighted fields variables available in the selected sample.

Correlation

lists the sampled variables, allowing you to choose the correlation variable.

Data File Reduction

enables the reduction of injection data in the selected sample and expands the dialog box to show inputs for **Data Reduction Settings For Selected Variables** and **Data Reduction Options**. For information about available data reduction settings, see Data Reduction of Samples (p. 2874).

Contour Plots from DPM Sample Data

allows you to generate named expressions from a sample file in order to use them for graphical postprocessing (contour plotting) on the surface where the DPM particles were sampled. For details, see Contour Plots of DPM Particle Sampling Results on a Planar Surface (p. 2875).

Plot

displays the histogram in the active graphics window.

Write...

stores the histograms in an XY-plot file format

Compute

updates the **Min** and **Max** values.

Read...

opens The Select File Dialog Box (p. 907), where you can select a sample file to be read.

Reduce...

reduces sample data in the selected sample. For more information, see Data Reduction of Samples (p. 2874). This button is available only if **Data File Reduction** is selected.

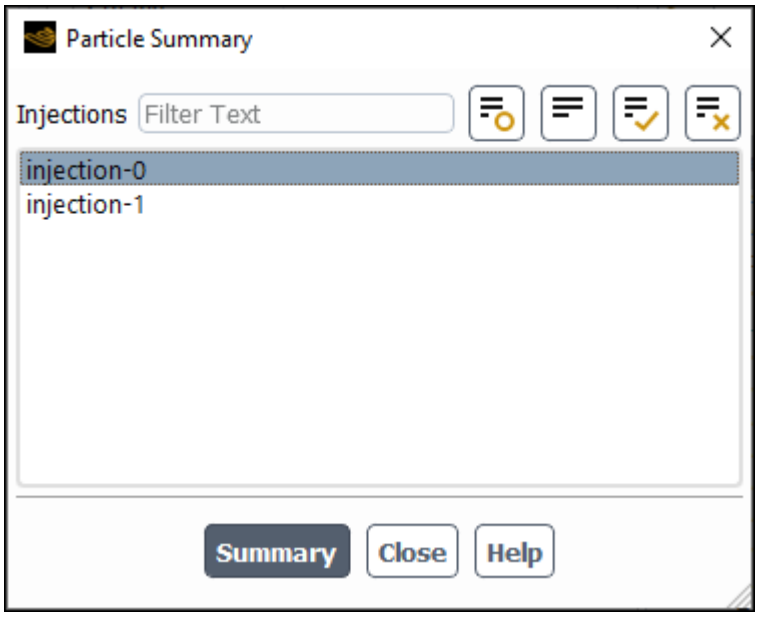
Delete

removes the sample selected in the **Sample** list.

50.20.8. Particle Summary Dialog Box

The **Particle Summary** dialog box allows you to report a summary for particle injections. See Summary Reporting of Current Particles (p. 2878) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Injections

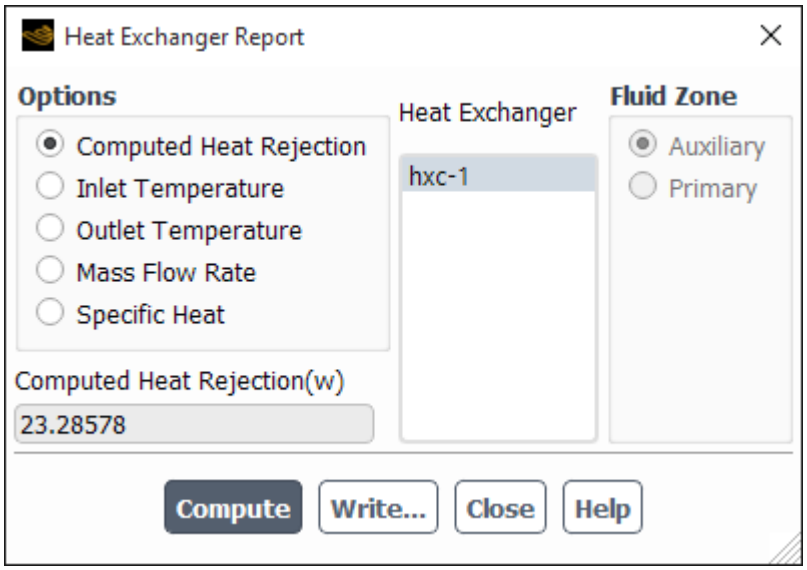
lists the particle injection(s) for which you can generate a summary.

Summary

prints the injection summary in the console window.

50.20.9. Heat Exchanger Report Dialog Box

The **Heat Exchanger Report** dialog box allows you to report a summary for heat exchangers. See Postprocessing for the Heat Exchanger Model (p. 2277) for details about the items below.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

lists the available reporting options for the heat exchanger.

Computed Heat Rejection

allows you to report the heat rejection calculated from the heat exchanger.

Inlet Temperature

allows you to report the inlet temperature for both the primary and the auxiliary heat exchanger fluid.

Outlet Temperature

allows you to report the outlet temperature for both the primary and the auxiliary heat exchanger fluid.

Mass Flow Rate

allows you to report the mass flow rate for both the primary and the auxiliary heat exchanger fluid.

Specific Heat

allows you to report the specific heat for both the primary and the auxiliary heat exchanger fluid.

Result

displays the results of the calculations once the **Compute** button is selected.

Heat Exchanger

displays a list of heat exchanger fluid zones

Fluid Zone

(not available when **Computed Heat Rejection** option is selected.) allows you to report quantities for either the primary or auxiliary fluid zones.

Compute

computes the specified quantity on the selected zones.

Write...

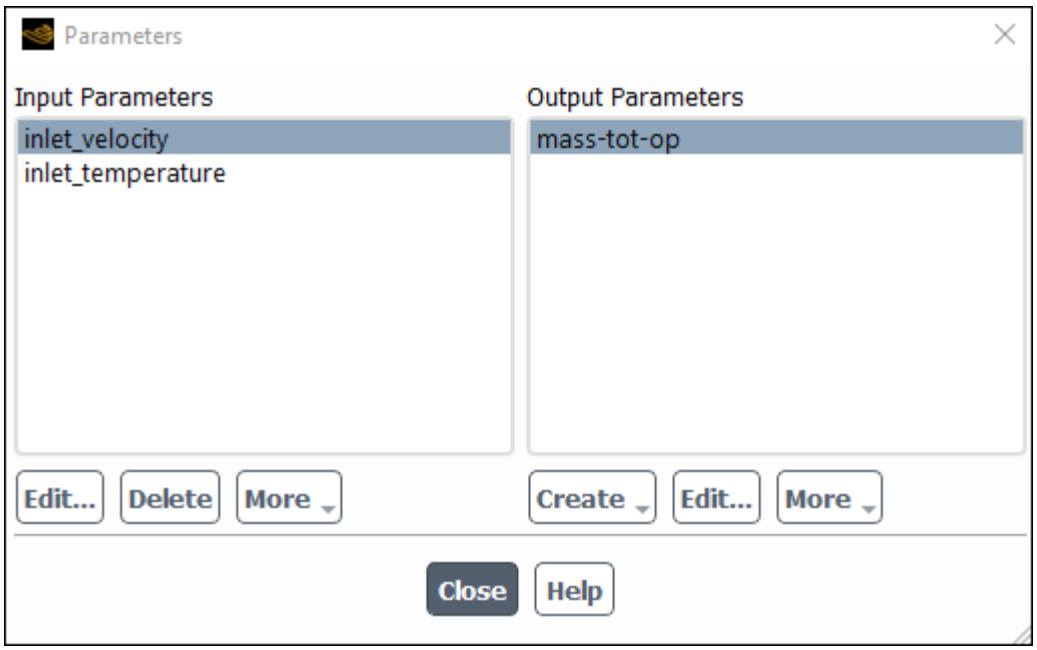
opens The Select File Dialog Box (p. 907), which you can use to save the reported values to a file.

50.20.10. Parameters Dialog Box

The **Parameters** dialog box allows you to create input parameters (in Scheme or user-defined function procedures only) and output parameters, which allow you to compare reporting values for different

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

cases, or include reporting values in the function minimized by the mesh morpher/optimizer. See Creating Output Parameters (p. 4099) for details about the items below.



Controls

Input Parameters

contains a list of existing input parameters. See Defining and Viewing Parameters (p. 1287) for details about creating input parameters.

Edit...

opens the Parameter Expression Dialog Box (p. 5289).

Important:

When using Ansys Fluent in Ansys Workbench, parameters are not editable, so the **Edit...** button becomes the **View...** button. This opens the Parameter Expression Dialog Box (p. 5289) where the parameter properties can only be viewed. For more information, see the separate Ansys Fluent in **Workbench** User's Guide.

Delete

removes the selected input parameter from the list of **Input Parameters**.

More

contains a drop-down list that allows more advanced use of input parameters. Available options include:

Use in Scheme Procedure

opens the Use Input Parameter in Scheme Procedure Dialog Box (p. 5287).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Use in UDF

opens the Use Input Parameter for UDF Dialog Box (p. 5288).

Output Parameters

contains a list of existing output parameters.

Create

opens the Report Definitions Dialog Box (p. 5536), allowing you to create additional output parameters based on report definitions.

Edit...

opens the dialog box corresponding to the selected item in the **Output Parameters** list.

More

contains a drop-down list containing additional tasks that you can perform, including:

Delete

removes the selected output parameter from the list of **Output Parameters**.

Rename

allows you to rename the selected output parameter.

Print to Console

reports values to the console window. If you select multiple output parameters, then the output includes values from multiple output parameters.

Print All to Console

outputs the values from all output parameters to the console window.

Write...

allows you to store the output to a file. A dialog box is displayed allowing you to provide a file name.

Write All...

prompts you for a file name and then writes the values for all of the output parameters to a file.

Note:

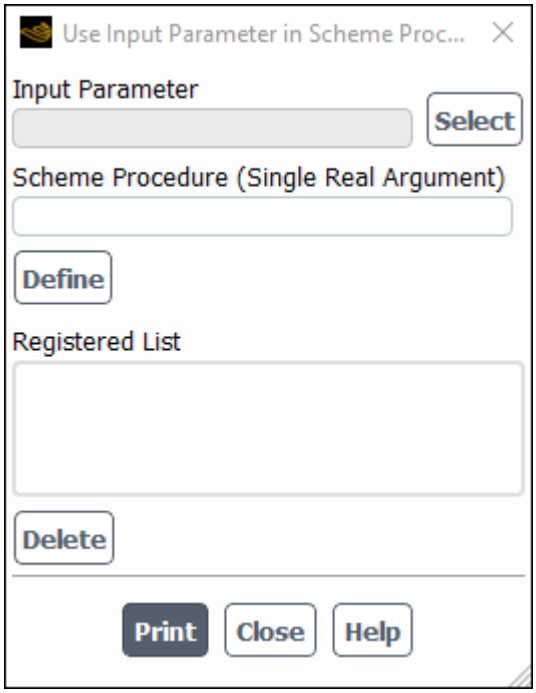
Ansys Fluent automatically creates generic default names for new input and output parameters (for example, `parameter-1`, `parameter-2`, `parameter-3`, and so on) If a parameter is deleted, the default name is not reused. For example, if you have `parameter-`

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

1, `parameter-2`, and `parameter-3`, then delete `parameter-2` and create a new parameter, the default name for the new parameter will be `parameter-4`.

50.20.11. Use Input Parameter in Scheme Procedure Dialog Box

The **Use Input Parameter in Scheme Procedure** dialog box allows you to use the input parameter in a Scheme procedure. In turn, this Scheme procedure can also use text user interface (TUI) commands. For more information, see Working With Advanced Parameter Options (p. 1291).



Controls

Input Parameter

contains the name of an input parameter.

Select

opens the Select Input Parameter Dialog Box (p. 4928) where an input parameter can be chosen.

Scheme Procedure (Single Real Argument)

contains a procedure name (if already defined using a Scheme file) or procedure body written in the Scheme language using `lambda`. This procedure should receive one real argument.

Define

registers the selected input parameter.

Registered List

contains a list of registered input parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

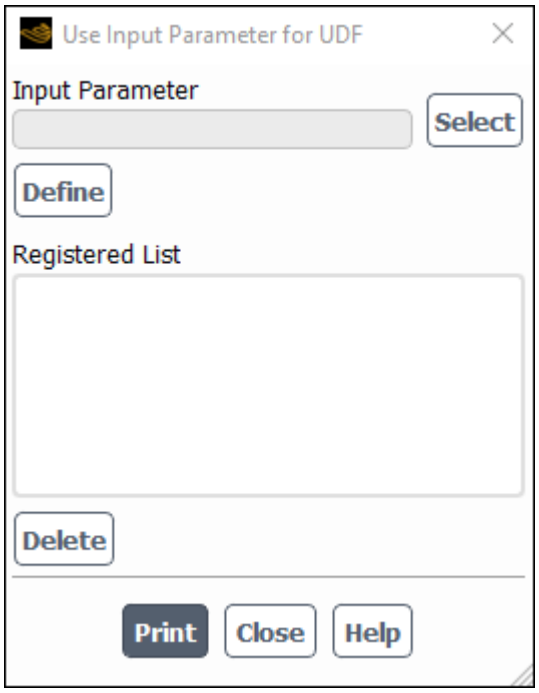
removes a selected registered input parameter from the list.

Print

prints details of the registered input parameters.

50.20.12. Use Input Parameter for UDF Dialog Box

The **Use Input Parameter for UDF** dialog box allows you to select the input parameters that can be used inside a user-defined function (UDF) during calculations.



Controls

Input Parameter

contains the name of an input parameter.

Select

opens the Select Input Parameter Dialog Box (p. 4928) where an input parameter can be chosen.

Define

registers the selected input parameter.

Registered List

contains a list of registered input parameters.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

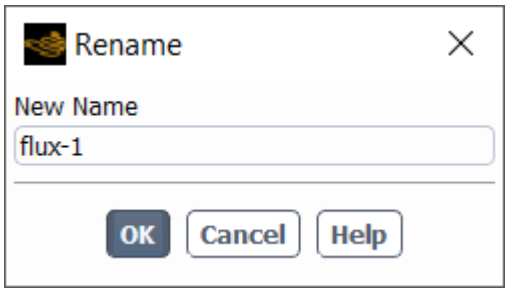
removes a selected registered input parameter from the list.

Print

prints the ID of the registered input parameters. The ID values are used to access the value of the parameter in the user-defined function.

50.20.13. Rename Dialog Box

The **Rename** dialog box allows you to change the name of the output parameter that you created.



Controls

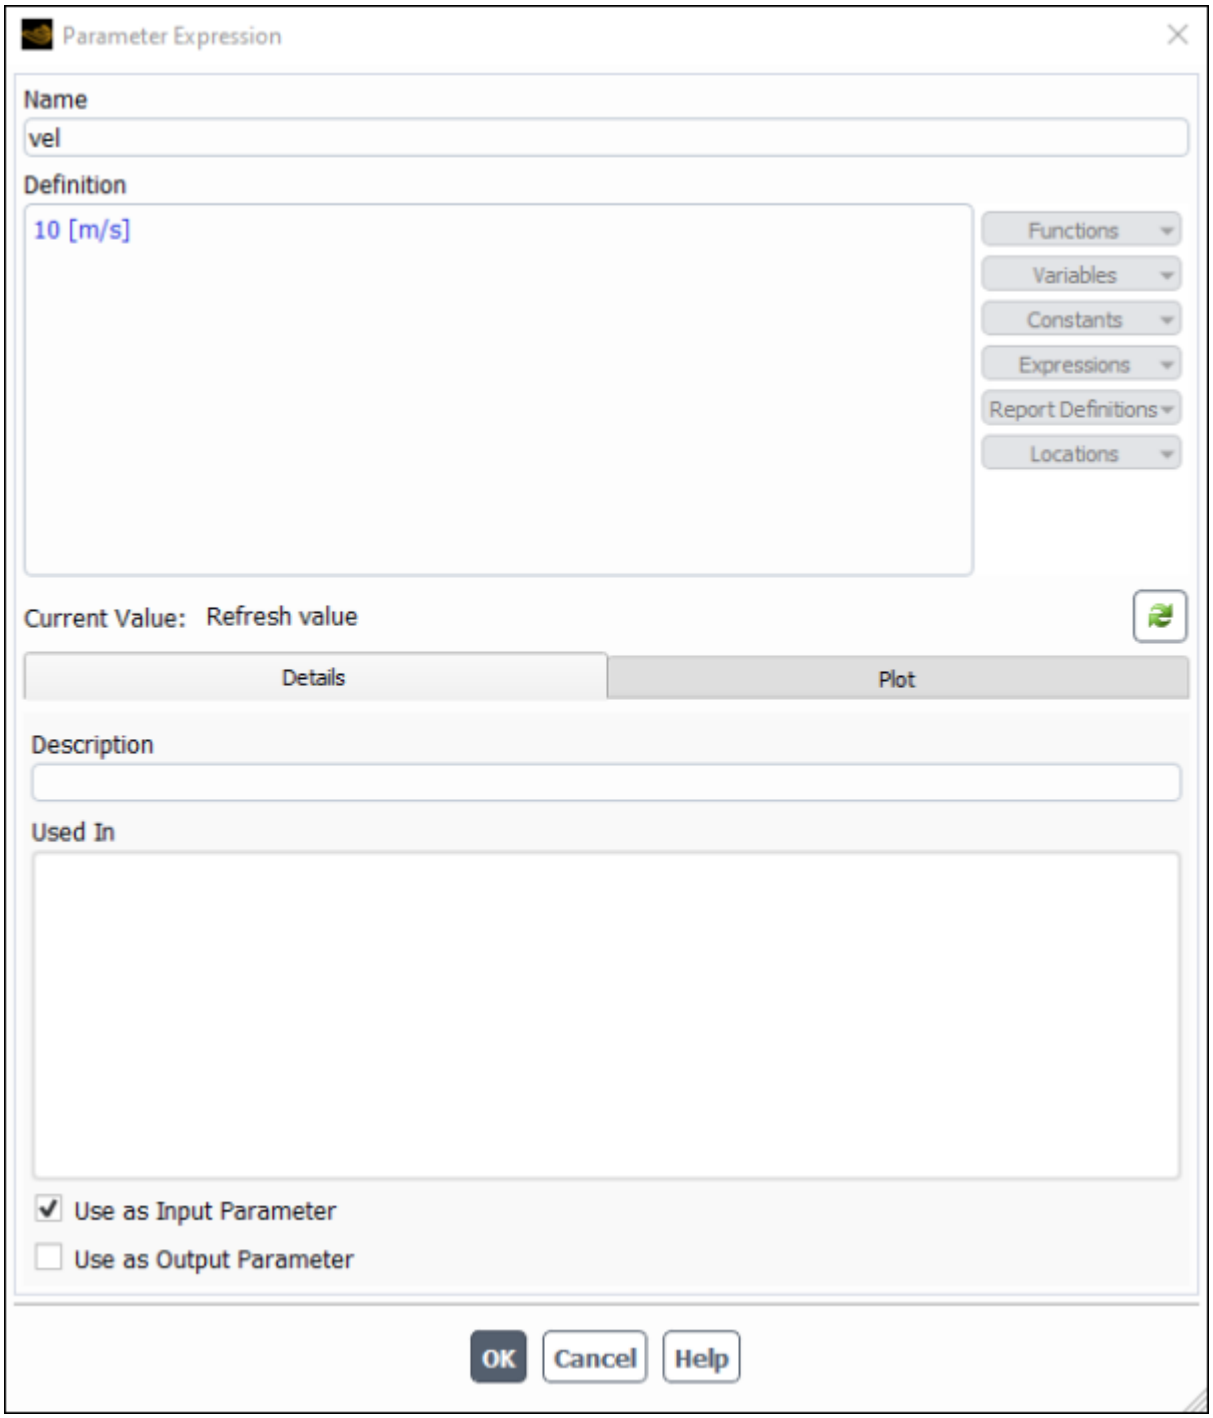
New Name

contains the new name of the output parameter.

50.20.14. Parameter Expression Dialog Box

The **Parameter Expression** dialog box allows you to create input parameters, which can be used to run a case and vary the value of the input to explore how the results change.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

contains the name of the input parameter expression.

Definition

contains the current value of the input parameter.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Used In

indicates the cell zone or boundary condition where the input parameter is currently used. The relevant zone or boundary condition will be displayed after you create an input parameter.

Important:

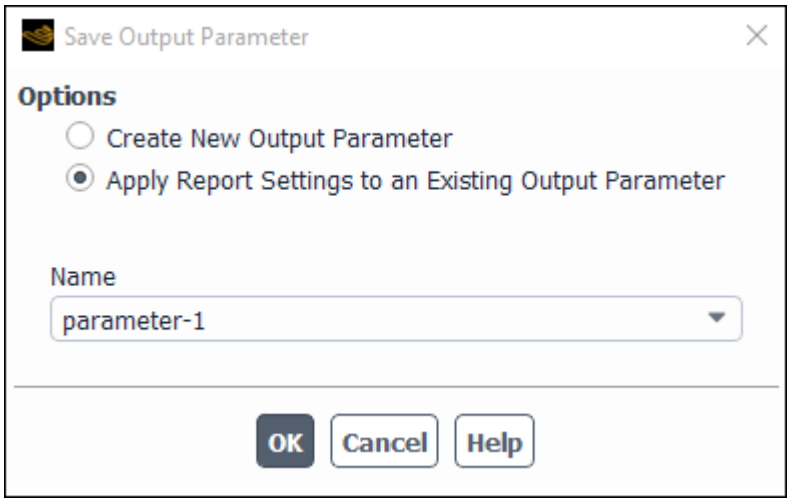
Input parameter expressions must be directly defined as a constant value including appropriate units; it may not reference another expression.

Note:

Ansys Fluent automatically creates generic default names for new input and output parameters (for example, `parameter_1`, `parameter_2`, `parameter_3`, and so on) If a parameter is deleted, the default name is not reused. For example, if you have `parameter_1`, `parameter_2`, and `parameter_3`, then delete `parameter_2` and create a new parameter, the default name for the new parameter will be `parameter_4`.

50.20.15. Save Output Parameter Dialog Box

The **Save Output Parameter** dialog box allows you to save specific output parameters that allow you to compare reporting values for different cases. See Creating Output Parameters (p. 4099) for details about the items below.



Controls

Options

contains options for saving your output parameters.

Create New Output Parameter

allows you to create a new output parameter.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Apply Report Settings to an Existing Output Parameter

allows you to overwrite an existing output parameter of the same type.

Name

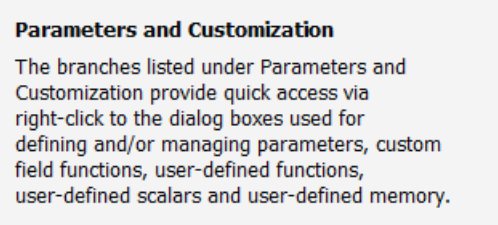
contains the name for the current output parameter.

Note:

Ansys Fluent automatically creates generic default names for new input and output parameters (for example, `parameter-1`, `parameter-2`, `parameter-3`, and so on) If a parameter is deleted, the default name is not reused. For example, if you have `parameter-1`, `parameter-2`, and `parameter-3`, then delete `parameter-2` and create a new parameter, the default name for the new parameter will be `parameter-4`.

50.21. Parameters and Customization Task Page

The **Parameters and Customization** task page introduces you to the parameterization and customization tools available for use in solving your CFD simulation using Ansys Fluent.



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Chapter 51: Ribbon Reference Guide

This reference guide provides information about the ribbon in Ansys Fluent.

51.1. File Ribbon Tab

51.2. Dialog Boxes Available from the Ribbon

51.1. File Ribbon Tab

51.1.1. File/Read/Mesh...

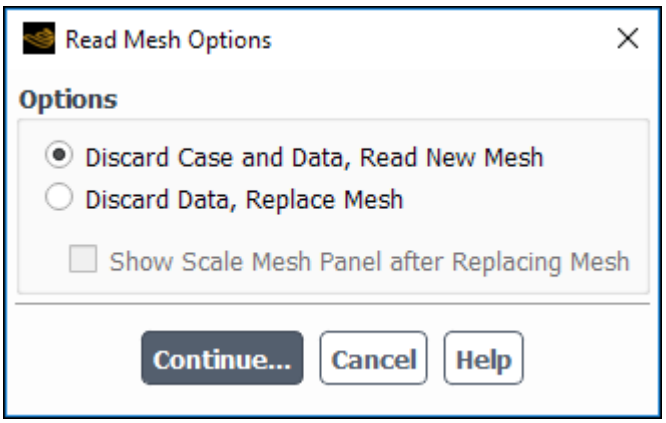
The **File/Read/Mesh...** ribbon tab item opens the Read Mesh Options Dialog Box (p. 5295), which allows you to read or replace a mesh.

51.1.1.1. Read Mesh Options Dialog Box

The **Read Mesh Options** dialog box is used to read or replace a mesh. See Reading Mesh Files (p. 929) for more information.

File → Read → Mesh...



Controls

Options

allows you to read in a new mesh or replace the existing mesh.

Discard Case And Data, Read New Mesh

results in both the case and data files being discarded when reading in a new mesh.

Discard Data, Replace Mesh

results in the data file being discarded when replacing an existing mesh.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

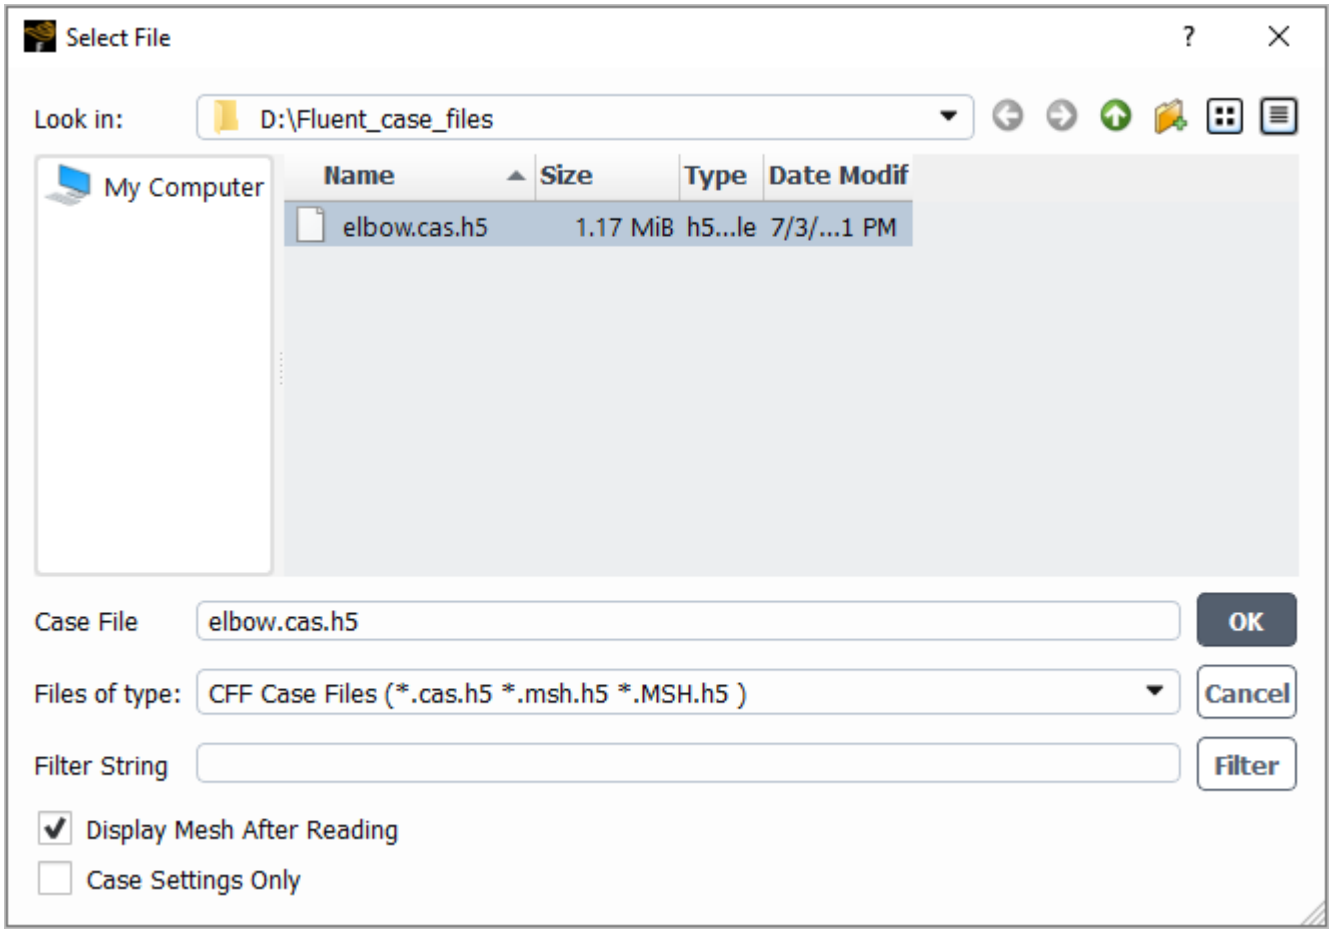
Show Scale Mesh Panel After Replacing Mesh

gives you the option to have the Scale Mesh Dialog Box (p. 4634) appear automatically for you to check or scale your mesh.

51.1.2. File/Read/Case...

The **File/Read/Case...** ribbon tab item is used to read an Ansys Fluent case file (extension `.cas.h5` or `.cas`), a mesh file (extension `.msh.h5`, `.msh`, `.grd`, `.MSH`, or `.GRD`), or the case settings only for a file (extension `.cas.h5` or `.msh.h5`) without any of the data associated with the mesh. For details, see Reading and Writing Case Files (p. 932), Reading Mesh Files (p. 929), and Reading Settings Only for Mesh or Case Files with Large Cell Counts (p. 938), respectively.

The **File/Read/Case...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to select the appropriate file to be read.



51.1.3. File/Read/Data...

The **File/Read/Data...** ribbon tab item is used to read in an Ansys Fluent data file (which has a `.dat.h5` or `.dat` extension). This item will not be available until you read in a case or mesh file. See Reading and Writing Data Files (p. 933) for details.

The **File/Read/Data...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to select the appropriate file to be read.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.4. File/Read/Case & Data...

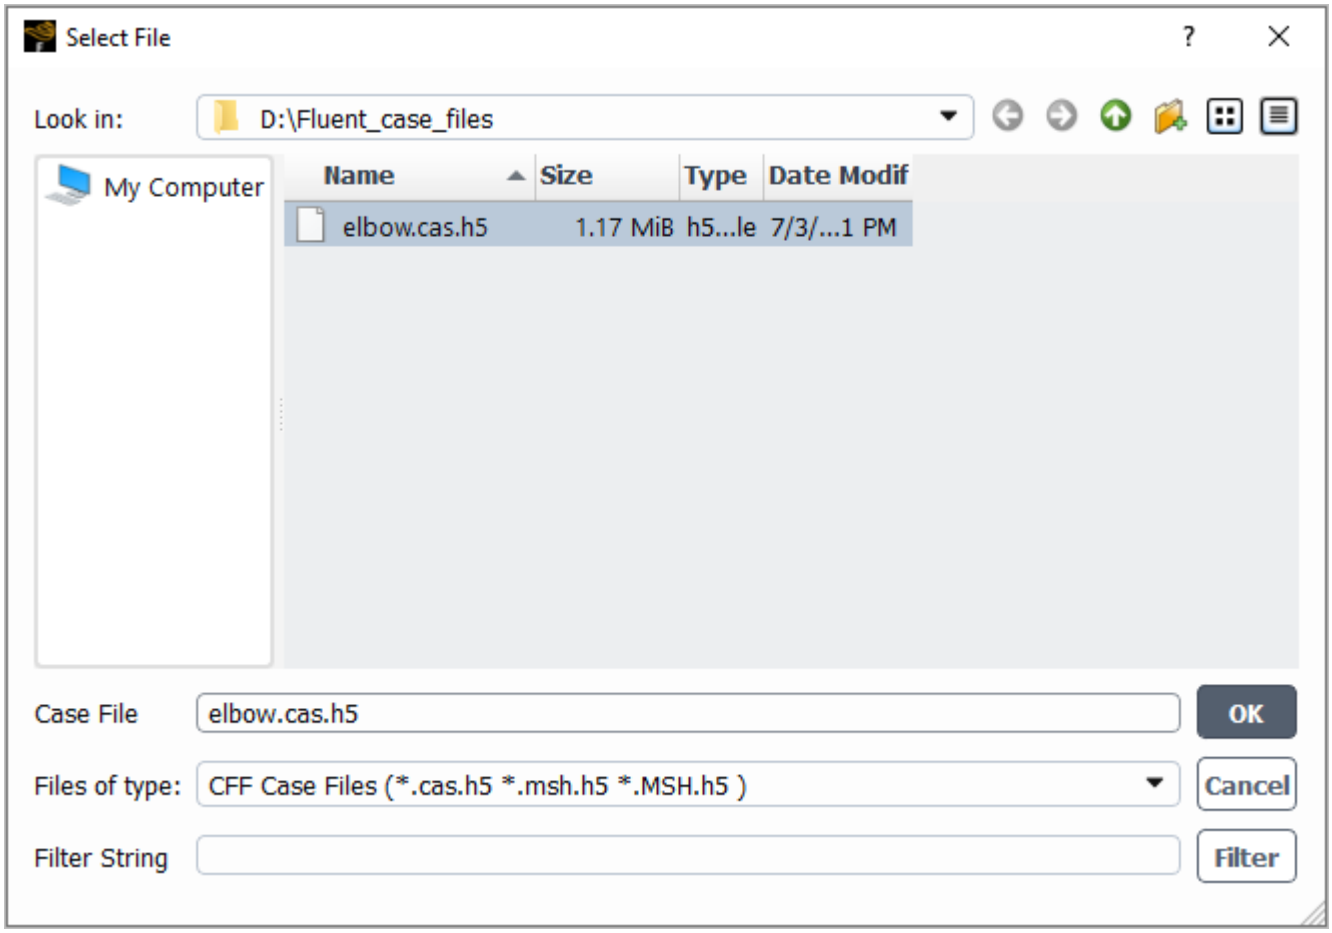
The **File/Read/Case & Data...** ribbon tab item is used to read in an Ansys Fluent case file and the corresponding data file (for example, `myfile.cas.h5` and `myfile.dat.h5`) together. See Reading and Writing Case and Data Files Together (p. 933) for details.

The **File/Read/Case & Data...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to select the appropriate files to be read. Select the appropriate case file, and the corresponding data file (that is, the file having the same name with a `.dat.h5` extension) will also be read in.

51.1.5. File/Read/Case Settings Only...

The **File/Read/Case Settings Only...** ribbon tab item is used to read the case settings only for a file (extension `.cas.h5` or `.msh.h5`), without any of the data associated with the mesh. For details, see Reading Settings Only for Mesh or Case Files with Large Cell Counts (p. 938).

The **File/Read/Case Settings Only...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to select the appropriate file for which you want to read the case settings.

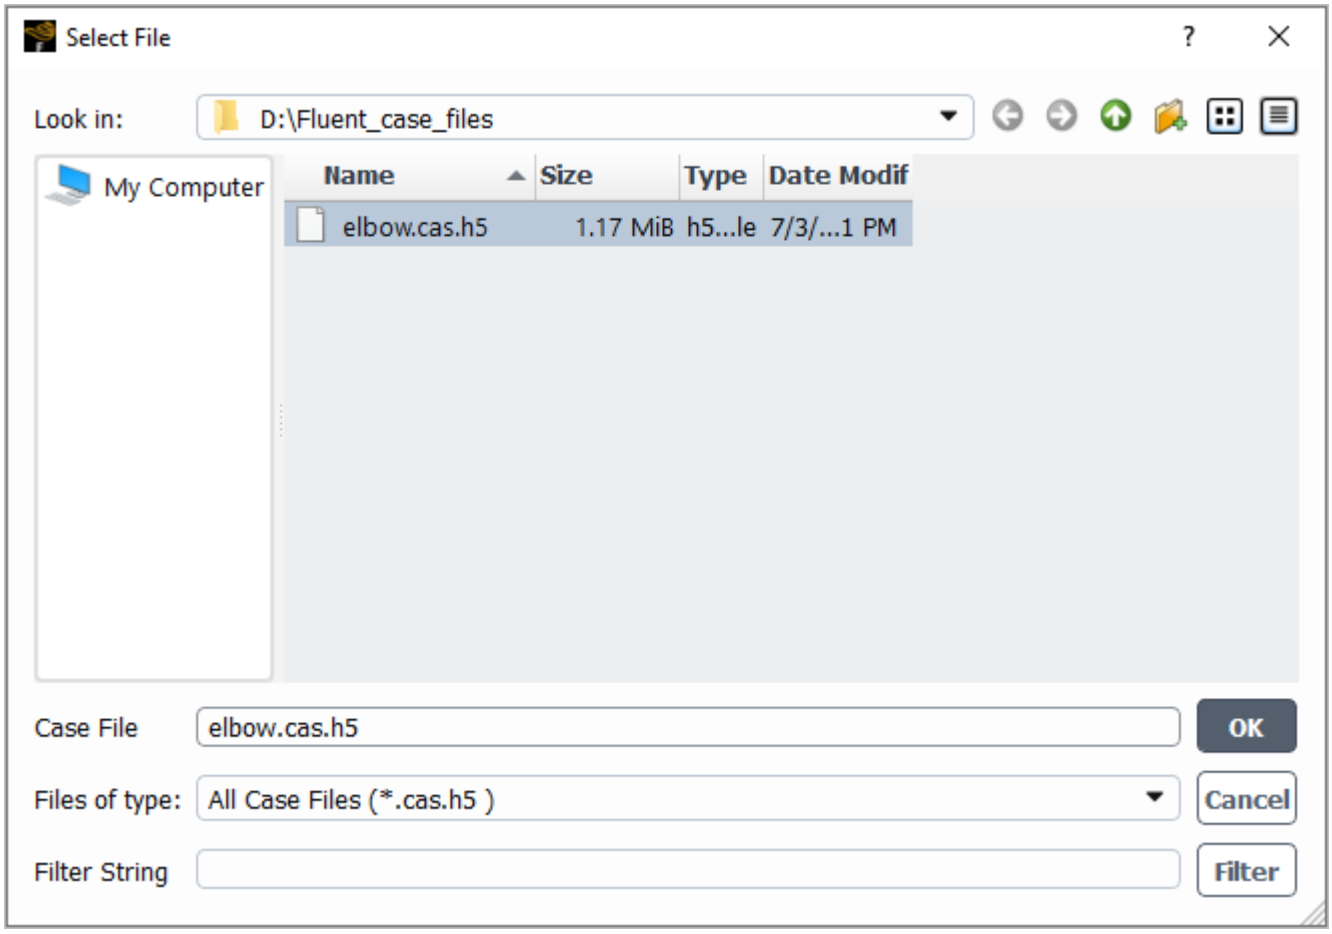


Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.6. File/Read/Case/Mesh Info...

The **File/Read/Case/Mesh Info...** ribbon tab item is used to read the information about a case or mesh file and print it in the console. The available summary includes the Fluent version that last saved the file, precision and dimension, and the total number of cells, faces, and nodes.

The **File/Read/Case/Mesh Info...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to select the appropriate case or mesh file for which you want to read information.



51.1.7. File/Read/PDF...

The **File/Read/PDF...** ribbon tab item is used to read a PDF file (extension `.pdf`) created by Ansys Fluent for use with the non-premixed or partially premixed combustion model. This item is available only when the non-premixed or partially premixed combustion model has been enabled. See Saving the Look-Up Tables (p. 2512) for details.

51.1.8. File/Read/ISAT Table...

The **File/Read/ISAT Table...** ribbon tab item is used to read an ISAT table (extension `.isat`) for use with the Composition PDF Transport model. This item is available only when the Composition PDF Transport model has been enabled. See Using ISAT Efficiently (p. 2457) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.9. File/Read/DTRM Rays...

The **File/Read/DTRM Rays...** ribbon tab item is used to read a ray file (extension `.ray`) created by Ansys Fluent for use with the DTRM (radiation model). This item is available only when the DTRM has been enabled. See Writing and Reading the DTRM Ray File (p. 2162) for details.

51.1.10. File/Read/View Factors...

The **File/Read/View Factors...** ribbon tab item is used to read in a view factor file for use with the surface-to-surface (S2S) radiation model. This item is available only when the S2S model has been enabled. See Reading View Factors into Ansys Fluent (p. 2175) for details.

51.1.11. File/Read/Profile...

The **File/Read/Profile...** ribbon tab item opens the **Select File** dialog box for reading profiles (Reading Profile Files (p. 940)), It is used to read cell zone or boundary condition profile files (extensions `.prof`, `.ttab`, `.csv`). A profile file defines profiles that can be used to specify flow conditions for a cell zone or a boundary. See Profiles (p. 1540) for details.

51.1.12. File/Read/Scheme...

The **File/Read/Scheme...** ribbon tab item is used to read in a Scheme source file (extension `.scm`). See Reading Scheme Source Files (p. 947) for details.

51.1.13. File/Read/Journal...

The **File/Read/Journal...** ribbon tab item is used to read in a journal file (extension `.jou`) containing a sequence of Ansys Fluent commands. You can create a journal file using the **File/Write/Journal...** ribbon tab item. See Creating and Reading Journal Files (p. 947) for details.

51.1.14. File/Write/Case...

The **File/Write/Case...** ribbon tab item is used to save an Ansys Fluent case file. See Reading and Writing Case Files (p. 932) for details.

The **File/Write/Case...** ribbon tab item opens The Select File Dialog Box (p. 907), which allows you to save the file with a name of choice. The dialog box is similar to the **Select File** dialog box for reading files, except that it has an additional option for writing binary files.

Important:

- When Ansys Fluent writes a case file, the `.cas.h5` extension is added to the file name specified, unless the name already ends with `.cas.h5`.
- You can also write a compressed file by appending `.gz` or `.Z` to the file name, if you have requested the reading and writing of files in the legacy format. (For details about file compression and the legacy format, see Reading and Writing Compressed Files (p. 926) and Reading and Writing Files in the Legacy Format (p. 934), respectively.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.15. File/Write/Data...

The **File/Write/Data...** ribbon tab item is used to save an Ansys Fluent data file (which has a `.dat.h5` or `.dat` extension). See Reading and Writing Data Files (p. 933) for details.

Important:

- When Ansys Fluent writes a data file, the `.dat.h5` extension is added to the file name specified, unless the name already ends with `.dat.h5`.
- You can compress data files by appending `.gz` or `.Z` to the file name, if you have requested the reading and writing of files in the legacy format. (For details about file compression and the legacy format, see Reading and Writing Compressed Files (p. 926) and Reading and Writing Files in the Legacy Format (p. 934), respectively.)

51.1.16. File/Write/Case & Data...

The **File/Write/Case & Data...** ribbon tab item is used to save an Ansys Fluent case file and data file at the same time (for example, `myfile.cas.h5` and `myfile.dat.h5`). See Reading and Writing Case and Data Files Together (p. 933) for details.

Enter the name of the case file in the text entry box in the **Select File** dialog box and the corresponding data file (same file name, but with a `.dat.h5` extension) will also be written.

51.1.17. File/Write/PDF...

The **File/Write/PDF...** ribbon tab item is used to write a PDF file after computing the look-up tables using the non-premixed or partially premixed combustion model in Ansys Fluent. This item is available only when the non-premixed or partially premixed combustion model has been enabled. See Saving the Look-Up Tables (p. 2512) for details.

51.1.18. File/Write/ISAT Table...

The **File/Write/ISAT Table...** ribbon tab item is used to write an ISAT table. See Using ISAT Efficiently (p. 2457) for details.

51.1.19. File/Write/Flamelet...

The **File/Write/Flamelet...** ribbon tab item is used to write a flamelet file generated using the non-premixed or partially premixed combustion model in Ansys Fluent. This item is available only when the non-premixed or partially premixed combustion model has been enabled. See The Diffusion Flamelet Models Theory in the Theory Guide for details.

51.1.20. File/Write/Profile...

The **File/Write/Profile...** ribbon tab item opens the Write Profile Dialog Box (p. 4936).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.21. File/Write/Autosave...

The **File/Write/Autosave...** ribbon tab item opens the Autosave Dialog Box (p. 5136).

51.1.22. File/Write/Boundary Mesh...

The **File/Write/Boundary Mesh...** ribbon tab item is used to write the boundary zones (surface mesh) of the domain to a file. You can then read this file into the meshing mode of Fluent or GAMBIT to produce an improved volume mesh. See Writing a Boundary Mesh (p. 947) for details.

51.1.23. File/Write/Start Journal...

The **File/Write/Start Journal...** ribbon tab item is used to start the recording of subsequent Ansys Fluent commands to a journal file. You can read this journal file back into Fluent later (using the **File/Read/Journal...** ribbon tab item) to automate the execution of the recorded commands. See Creating and Reading Journal Files (p. 947) for details.

51.1.24. File/Write/Stop Journal

The **File/Write/Stop Journal** ribbon tab item replaces the **File/Write/Start Journal...** ribbon tab item after the recording of a journal file has begun. The **File/Write/Stop Journal** ribbon tab item is used to end the journal recording. See Creating and Reading Journal Files (p. 947) for details.

51.1.25. File/Write/Start Transcript...

The **File/Write/Start Transcript...** ribbon tab item is used to start the recording of a transcript file containing all input to and output from Fluent. (You cannot read a transcript file back into Fluent.) See Creating Transcript Files (p. 951) for details.

51.1.26. File/Write/Stop Transcript

The **File/Write/Stop Transcript** ribbon tab item replaces the **File/Write/Start Transcript...** ribbon tab item after the recording of a transcript file has begun. The **File/Write/Stop Transcript** ribbon tab item is used to end the transcript recording. See Creating Transcript Files (p. 951) for details.

51.1.27. File/Import/ABAQUS/Input File...

The **File/Import/ABAQUS/Input File...** ribbon tab item is used to import an ABAQUS input file (extension `.inp`), which contains the input description of a finite element model for the ABAQUS finite element program. See ABAQUS Files (p. 954) for details.

51.1.28. File/Import/ABAQUS/Filbin File...

The **File/Import/ABAQUS/Filbin File...** ribbon tab item is used to import an ABAQUS filbin file (extension `.fil`), which contains the finite element model and results data. See ABAQUS Files (p. 954) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.29. File/Import/ABAQUS/ODB File...

The **File/Import/ABAQUS/ODB File...** ribbon tab item is used to import an ABAQUS ODB file with a `.odb` extension. See ABAQUS Files (p. 954) for details.

51.1.30. File/Import/CFX/Definition File...

The **File/Import/CFX/Definition File...** ribbon tab item is used to import a CFX definition file (extension `.def`), which contains mesh information to be read into Fluent. See CFX Files (p. 954) for details.

51.1.31. File/Import/CFX/Result File...

The **File/Import/CFX/Result File...** ribbon tab item is used to import a CFX result file (extension `.res`). See CFX Files (p. 954) for details.

51.1.32. File/Import/CGNS/Mesh...

The **File/Import/CGNS/Mesh...** ribbon tab item is used to read in a CGNS-format mesh file (extension `.cgns`). See Meshes and Data in CGNS Format (p. 955) for details.

51.1.33. File/Import/CGNS/Data...

The **File/Import/CGNS/Data...** ribbon tab item is used to read in a CGNS-format data file. See Meshes and Data in CGNS Format (p. 955) for details.

51.1.34. File/Import/CGNS/Mesh & Data...

The **File/Import/CGNS/Mesh & Data...** ribbon tab item is used to read in a set of CGNS-format mesh and data files. See Meshes and Data in CGNS Format (p. 955) for details.

51.1.35. File/Import/EnSight...

The **File/Import/EnSight...** ribbon tab item is used to import EnSight files (extension `.encas` or `.case`). See EnSight Files (p. 956) for details.

51.1.36. File/Import/FIDAP...

The **File/Import/FIDAP...** ribbon tab item is used to import an ANSYS FIDAP neutral file (extension `.FDNEUT` or `.unv`).

51.1.37. File/Import/GAMBIT...

The **File/Import/GAMBIT...** ribbon tab item is used to read in a neutral file from GAMBIT. See GAMBIT and GeoMesh Mesh Files (p. 956) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.38. File/Import/HYPERMESH ASCII...

The **File/Import/HYPERMESH ASCII...** ribbon tab item is used to import a **HYPERMESH ASCII** file (extension `.hm`, `.hma`, or `.hmascii`). See HYPERMESH ASCII Files (p. 956) for details.

51.1.39. File/Import/I-deas Universal...

The **File/Import/I-deas Universal...** ribbon tab item is used to import an I-deas Universal file, which contains mesh information and zone types to be read into Fluent.

51.1.40. File/Import/LSTC/Input File...

The **File/Import/LSTC/Input File...** ribbon tab item is used to import an LSTC input file (extension `.k`, `.key`, or `.dyn`), which contains the input description of a finite element model for the LS-DYNA finite element program.

51.1.41. File/Import/LSTC/State File...

The **File/Import/LSTC/State File...** ribbon tab item is used to import an LSTC state file (extension `.d3plot`), which contains control data, geometry data, and state data.

51.1.42. File/Import/Marc POST...

The **File/Import/Marc POST...** ribbon tab item is used to import a Marc POST file generated using the MSC Marc finite element program.

51.1.43. File/Import/Mechanical APDL/Input File...

The **File/Import/Mechanical APDL/Input File...** ribbon tab item is used to import a Mechanical APDL input file (extensions `.ans`, `neu`, `.cdb`, or `.prep7`), which contains mesh information to be read into Fluent. See Mechanical APDL Files (p. 957) for details.

51.1.44. File/Import/Mechanical APDL/Result File...

The **File/Import/Mechanical APDL/Result File...** ribbon tab item is used to import a Mechanical APDL result file (extension `.rst`, `.rth`, or `.rmg`). See Mechanical APDL Files (p. 957) for details.

51.1.45. File/Import/NASTRAN/Bulkdata File...

The **File/Import/NASTRAN/Bulkdata File...** ribbon tab item is used to import a NASTRAN Bulkdata file (extension `.nas*`, `.dat*`, or `.bdf*`), which contains mesh information to be read into Fluent. See NASTRAN Files (p. 957) for details.

51.1.46. File/Import/NASTRAN/Op2 File...

The **File/Import/NASTRAN/Op2 File...** ribbon tab item is used to import a NASTRAN Op2 file (extension `.op2`), which is an output binary data file containing data used in the NASTRAN finite element program. See NASTRAN Files (p. 957) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.47. File/Import/PATRAN/Neutral File...

The **File/Import/PATRAN/Neutral File...** ribbon tab item is used to read in a PATRAN Neutral file (extension `.neu`, `.out`, or `.pat`) zoned by named components (that is, with the nodes placed into zones based on group name). The PATRAN neutral file contains mesh information to be read into Fluent.

51.1.48. File/Import/PLOT3D/Grid File...

The **File/Import/PLOT3D/Grid File...** ribbon tab item is used to import a PLOT3D grid file (extension `.g`, `.x`, `.xyz`, or `.grd`). See PLOT3D Files (p. 958) for details.

51.1.49. File/Import/PLOT3D/Result File...

The **File/Import/PLOT3D/Result File...** ribbon tab item s used to import a PLOT3D result file (extension `.g`, `.x`, `.xyz`, or `.grd`). See PLOT3D Files (p. 958) for details.

51.1.50. File/Import/PTC Mechanica Design...

The **File/Import/PTC Mechanica Design...** ribbon tab item is used to import a PTC Mechanica Design file (extension `.neu`), which contains analysis, model, and results data (only in binary form).

51.1.51. File/Import/Tecplot...

The **File/Import/Tecplot...** ribbon tab item is used to read in a Tecplot binary file. See Tecplot Files (p. 958) for details.

51.1.52. File/Import/Fluent 4 Case File...

The **File/Import/Fluent 4 Case File...** ribbon tab item is used to read in a case file created in FLUENT 4.

51.1.53. File/Import/PreBFC File...

The **File/Import/PreBFC File...** ribbon tab item is used to read in a structured (quadrilateral or hexahedral) mesh that was created using PreBFC.

51.1.54. File/Import/Partition/Metis...

The **File/Import/Partition/Metis...** ribbon tab item is used to partition a mesh and then read it into the parallel version of Ansys Fluent. See Using the Partition Filter (p. 4304) for an explanation of the difference between this item and the **File/Import/Partition/Metis Zone...** ribbon tab item.

51.1.55. File/Import/Partition/Metis Zone...

The **File/Import/Partition/Metis Zone...** ribbon tab item is used to partition each cell zone in a mesh individually and then read the mesh into the parallel version of Ansys Fluent. See Using the Partition

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Filter (p. 4304) for an explanation of the difference between this item and the **File/Import/Partition/Metis...** ribbon tab item.

51.1.56. File/Import/CHEMKIN Mechanism...

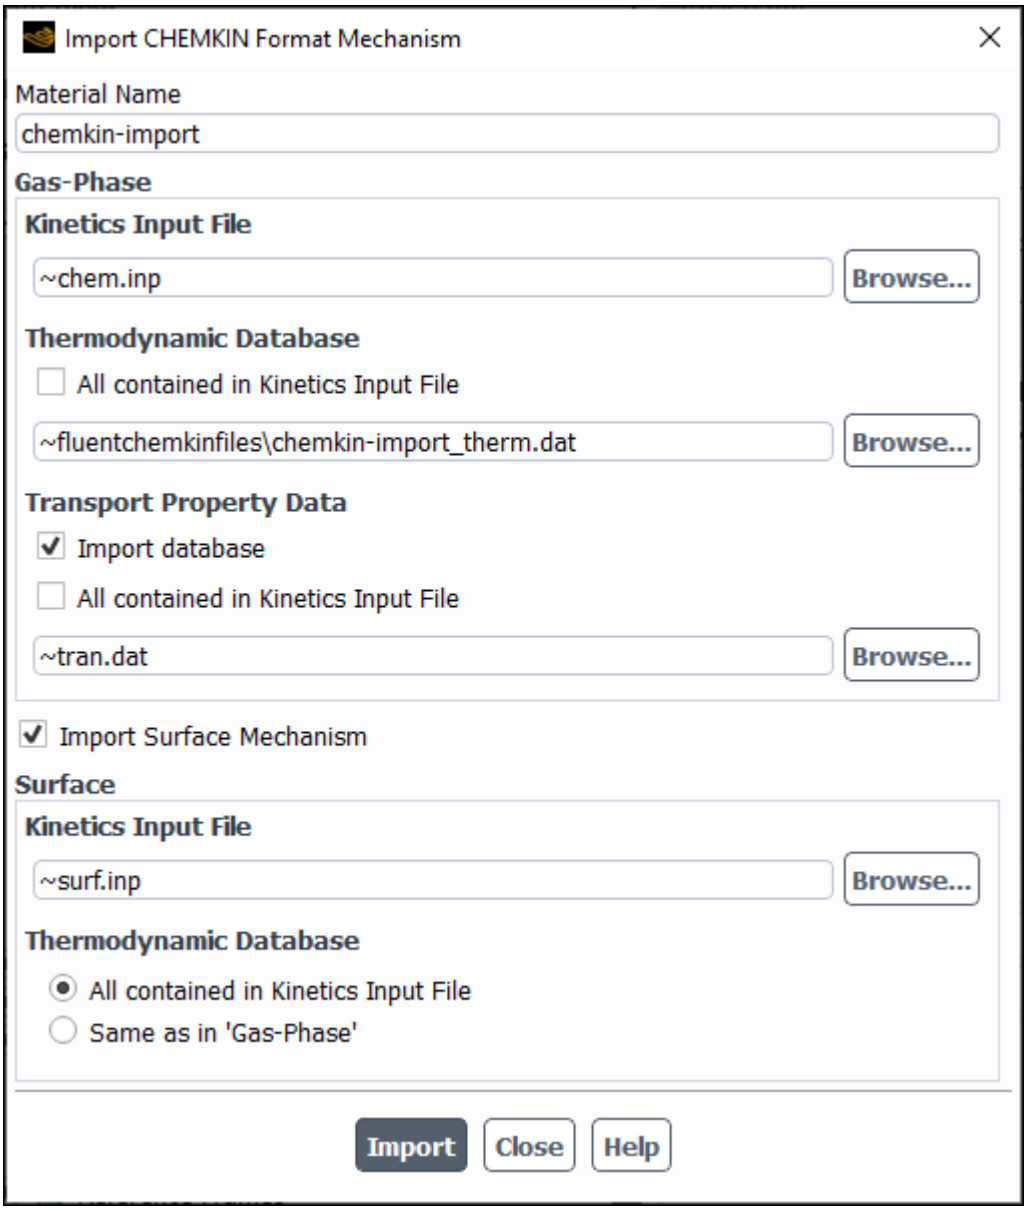
The **File/Import/CHEMKIN Mechanism...** ribbon tab item opens the Import CHEMKIN Format Mechanism Dialog Box (p. 5305).

51.1.56.1. Import CHEMKIN Format Mechanism Dialog Box

The **Import CHEMKIN Format Mechanism** dialog box is used to import a CHEMKIN-format chemical mechanism file into Ansys Fluent. See Importing a Volumetric Kinetic Mechanism in CHEMKIN Format (p. 2366) for details. The dialog box can be accessed either from the Species Model Dialog Box (p. 4716) or from the main menu:

File → Import → CHEMKIN Mechanism...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Material Name

specifies a name for the material.

Gas-Phase

contains inputs for importing the gas-phase mechanism in CHEMKIN format.

Kinetics Input File

specifies the name of the gas-phase file in CHEMKIN-format. If the file is not in the current working folder, include the full path to the folder where it is located.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thermodynamic Database

specifies thermodynamic property data for species whose thermodynamic data are not specified in the kinetics input file. You can enable **All contained in Kinetics Input Files** to indicate that the kinetics input file contains the thermodynamic data for all the species.

Transport Property Data (Optional)

(if **Import database** is enabled) allows you to specify transport property data for species whose transport data are not specified in the kinetics input file. You can enable **All contained in Kinetics Input Files** to indicate that the kinetics input file contains the transport data for all the species.

Import Surface Mechanism

enables the importing of the surface mechanism.

Surface

contains inputs for importing the surface mechanism. This group box appears only when the **Import Surface Mechanism** option is enabled.

Kinetics Input File

specifies the name of the surface kinetics CHEMKIN-format file.

Thermodynamic Database

specifies whether the thermodynamic data for the surface-chemistry species will be included in the surface kinetics CHEMKIN-format file (if **All contained in Kinetics Input File** is enabled or in the thermodynamic database file specified in the **Gas-Phase** group box (if **Same as 'Gas-Phase'** is enabled). Note that if no thermodynamic database file is specified in the **Gas-Phase** group box, the thermodynamic data for all surface-chemistry species must be included the surface kinetics input file.

Import

imports the specified Chemkin reaction mechanism and thermal files and saves the imported data in the Fluent case file. Note that carrying the original input files along with the Fluent case file is not required. Ansys Fluent will automatically regenerate these files when needed (for example, when using the CHEMKIN-CFD solver).

51.1.57. File/Import/FMU...

The **File/Import/FMU...** ribbon tab item opens the Figure 3.21:**Import FMU File** Dialog Box (p. 1005).

51.1.58. File/Export/Solution Data...

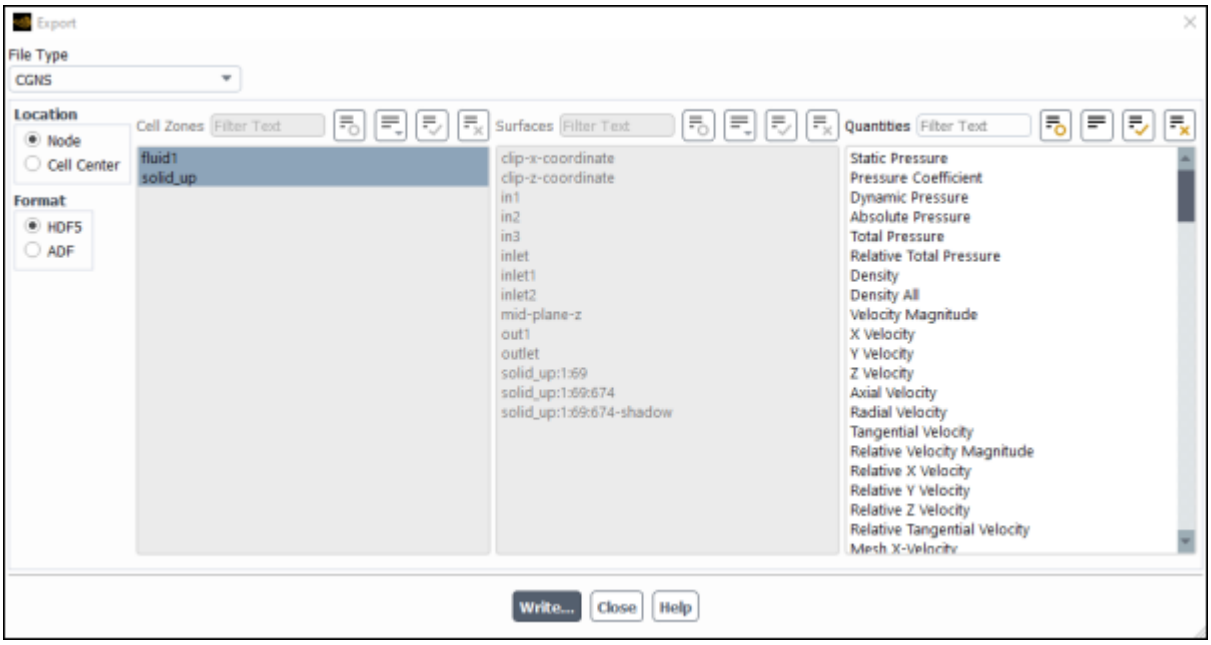
The **File/Export/Solution Data...** ribbon tab item opens the Export Dialog Box (p. 5308).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.58.1. Export Dialog Box

The **Export** dialog box allows you to write data that can be read by other data visualization and postprocessing tools. See Exporting Solution Data (p. 959) for a complete description of the available data formats and how to use the dialog box.

File → Export → Solution Data...



Controls

File Type

contains a drop-down list that controls the output file format that will be written using the **Write...** button.

ABAQUS

allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension `.inp`).

ASCII

allows you to specify the surface(s), scalars, location in the cell from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an ASCII file.

AVS

allows you to specify the scalars you want to write to be exported to an AVS file.

CDAT for CFD-Post & EnSight

allows you to specify the cell zones, surfaces, quantities, and format (**Binary** or **ASCII**) for data export. The `.cdat` file format is compatible with both CFD-Post and EnSight.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

CGNS

allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a CGNS file (extension `.cgns`).

Common Fluids Format - Post

allows you to specify the cell zones, surfaces, and quantities that you want exported *(note that only nodal values are exported)*. The following files are written in the hierarchical data format (HDF) from the **Export** dialog box: `<filename>.cas.post` and `<filename>.dat.post`.

Data Explorer

allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension `.dx`).

EnSight Case Gold

allows you to specify the scalars you want to write, the cell zones, interior zone surfaces, and location in the cell from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension `.geo`, `.vel`, `.scl1`, or `.encas`).

EnSight DVS

allows you to specify the cell zones or surfaces (not both) and the quantities that you want to write, and whether the data is written for nodes or cell centers. Data is exported in `.dvs` format for import to EnSight.

FAST

allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution

allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured

allows you to specify the scalars you want to write and the cell zones or surfaces from which the values of scalar functions are to be taken, to be exported to a FIELDVIEW binary file (extension `.fvuns`) and a regions file (extension `.fvuns.fvreg`).

Note:

You must deselect all cell zones before you can select any surfaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I-deas Universal

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input

allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL Input file (extension `.cdb`).

NASTRAN

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension `.bdf`).

PATRAN

allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension `.out`).

TAITherm

allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension `.neu`). This option is available only when the **Energy Equation** is enabled.

Tecplot

allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Cell Zones

specifies the cell zones for which data is to be written for a CFD-Post compatible, EnSight, or FIELDVIEW file.

Surfaces

specifies the surfaces for which data is to be written for an ABAQUS, ASCII, Data Explorer, I-deas Universal, Mechanical APDL Input, NASTRAN, PATRAN, TAITherm, or Tecplot file.

Quantities

specifies valid functions for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected **File Type**.

Structural Loads

contains optional structural loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Structural** analysis is selected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Force

enables force to be written as a load for a structural analysis.

Pressure

enables pressure to be written as a load for a structural analysis.

Temperature

enables temperature to be written as a load for a structural analysis. This option is available only when the **Energy Equation** is enabled.

Thermal Loads

contains optional thermal loads that can be written to ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN files. This option is available only when **Thermal** analysis is selected.

Temperature

enables temperature to be written as a load for a thermal analysis.

Heat Flux

enables heat flux to be written as a load for a thermal analysis.

Heat Trans Coeff

enables heat transfer coefficient to be written as a load for a thermal analysis.

Location (for ASCII, CGNS, and EnSight Case Gold formats)

specifies the location in the cell from which the values of scalar functions are to be taken.

Node

specifies that data values at the node points are to be exported.

Cell Center

specifies that data values from the cell centers are to be exported.

EnSight Parallel

(Available only with Fluent in parallel) creates `.encas` files suitable for use in EnSight Enterprise.

Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats

specifies the finite element analysis intended.

Structural

specifies structural analysis and allows you to select the **Structural Loads** to be written.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thermal

specifies thermal analysis and allows you to select the **Thermal Loads** to be written.

Delimiter (for ASCII format only)

specifies the delimiter used to separate the data fields.

Comma

specifies comma as the delimiter separating the data fields.

Space

specifies space as the delimiter separating the data fields.

Transient (for EnSight Case Gold only)

contains options for exporting transient data.

Transient

enables export of transient data.

Separate Files for Each Timestep

enables writing separate files for each timestep.

Append Frequency

specifies the frequency for appending the data during the solution process.

Important:

The **Append Frequency** option is replaced by the **Write Frequency** option when **Separate Files for Each Timestep** is enabled. You can specify the frequency for writing the separate files.

File Name

specifies the root name for the files to be saved.

Format (for EnSight Case Gold and CDAT for CFD-Post & EnSight)

specifies the file format.

Binary

specifies the file format as binary.

ASCII

specifies the file format as ASCII.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Heat Transfer Coefficient (for TAITherm format only)

specifies the basis for the heat transfer coefficient exported.

Flux Based

specifies the flux based method for writing the heat transfer coefficient.

Wall Function

specifies the wall function based method for writing the heat transfer coefficient.

Write Case File (for CDAT for CFD-Post & EnSight only)

specifies that a case file is written with the `.cdat` file.

Write...

opens The Select File Dialog Box (p. 907) for writing the specified function(s) in the specified format.

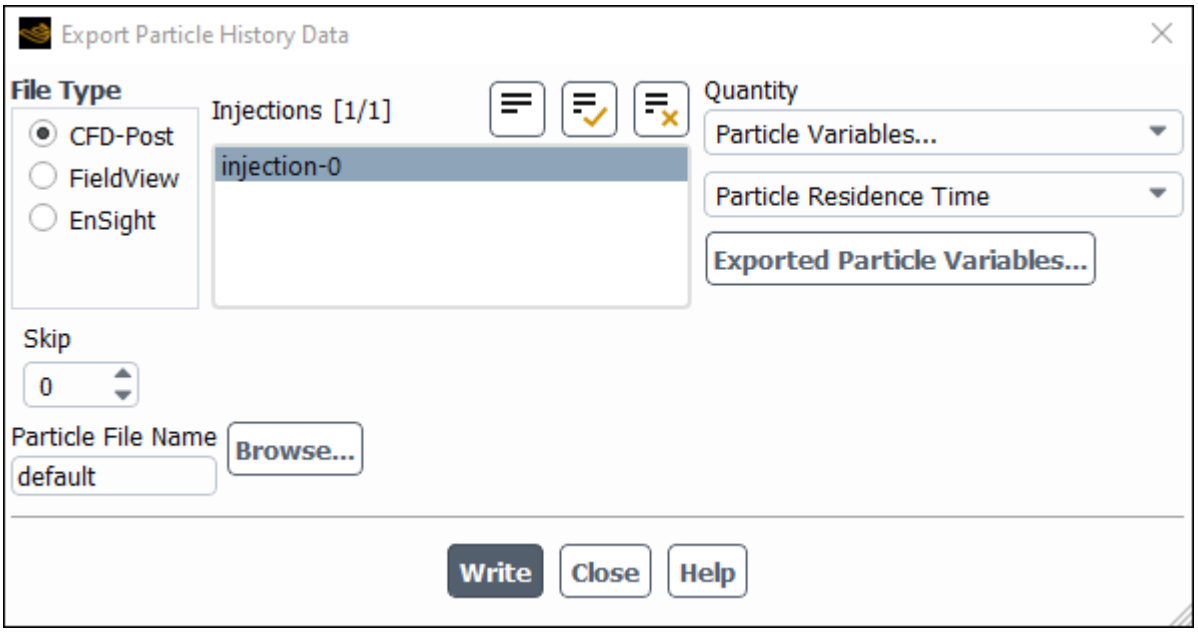
51.1.59. File/Export/Particle History Data...

The **File/Export/Particle History Data...** ribbon tab item opens the Export Particle History Data Dialog Box (p. 5313).

51.1.59.1. Export Particle History Data Dialog Box

The **Export Particle History Data** dialog box allows you to export particle history data as your solution progresses. See Exporting Steady-State Particle History Data (p. 974) for details.

File → Export → Particle History Data...



Controls

Type

specifies the type of the file you want to write.

CFD-Post

allows you to write the file in CFD-Post particle tracks format, which can be read in **CFD-Post**.

FieldView

allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

EnSight

allows you to write the file in **EnSight** format.

Geometry

allows you to write the file in `.ibl` format, which can be read in GAMBIT (not available when **Unsteady Particle Tracking** is enabled in the **Discrete Phase Model** dialog box, which is opened by clicking **Discrete Phase...** in the **Physics** ribbon tab).

Injections

allows you to select the required injection from the list of predefined injections.

Quantity

contains the list of variables for which you can export the particle data.

Skip

allows you to "thin" or "sample" the number of particles that are exported.

Coarsen

reduces the exported file size by reducing the number of points that are written for a given trajectory. This is only valid for steady-state cases.

When exporting to an EnSight file, you can use this value to reduce the temporary file size written during tracking with a small effect on accuracy of the trajectory. The number of steps per trajectory finally exported to the EnSight file is the same as the **Number of Particle Time Steps**.

Particle File Name

allows you to specify the file name/directory for the exported data, using the **Browse...** button.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Encas File Name

is the file name you will specify if you selected **EnSight** under **Type**. Use the **Browse...** button to select the `.encas` file that was created when you exported the file with the **File/Export...** ribbon tab option.

Number of Particle Time Steps

appears when you select **EnSight** under **Type**. The specified number is the number of particle time-steps that are saved to the `.encas` file.

51.1.60. File/Export/During Calculation/Solution Data...

The **File/Export/During Calculation/Solution Data...** ribbon tab item opens the Automatic Export Dialog Box (p. 5139) (transient cases only).

51.1.61. File/Export/During Calculation/Particle History Data...

The **File/Export/During Calculation/Particle History Data...** ribbon tab item opens the Automatic Particle History Data Export Dialog Box (p. 5144) (transient cases only).

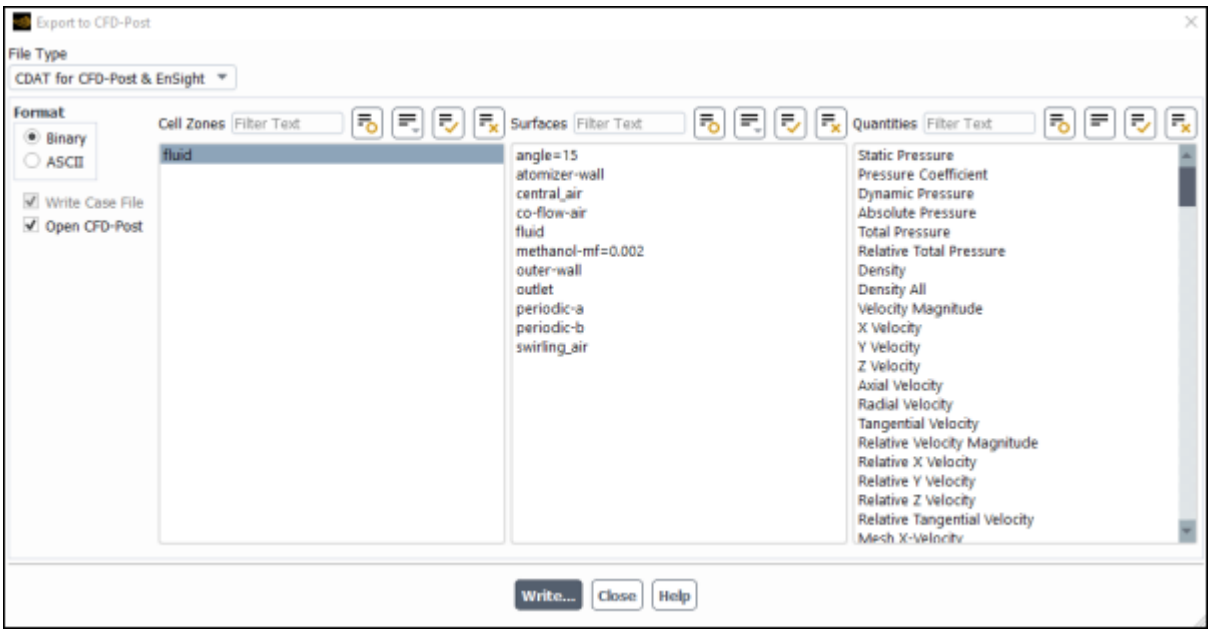
51.1.62. File/Export to CFD-Post...

The **File/Export to CFD-Post...** ribbon tab item opens the Export to CFD-Post Dialog Box (p. 5315).

51.1.62.1. Export to CFD-Post Dialog Box

The **Export to CFD-Post** dialog box allows you to select the quantities that you would like to export to CFD-Post. See Exporting to Ansys CFD-Post (p. 982) for details.

File → Export to CFD-Post...



Controls

Select Quantities

contains a selectable list where you can choose the quantities to export.

Format

allows you to export the `.cdat` file in **Binary** or **ASCII** format.

Write Case File

specifies that a case file is written with the `.cdat` file.

Open CFD-Post

specifies that after the files have been written, a CFD-Post session is opened, with the case and `.cdat` files loaded. CFD-Post will display the results.

Write...

opens the **Select File** dialog box, where you can specify the name and location of the exported files.

51.1.63. File/Table File Manager...

The **File/Table File Manager...** ribbon tab item opens the **Table File Manager** dialog box (see Figure 3.6: The Table File Manager Dialog Box (p. 945)).

51.1.64. File/Solution Files...

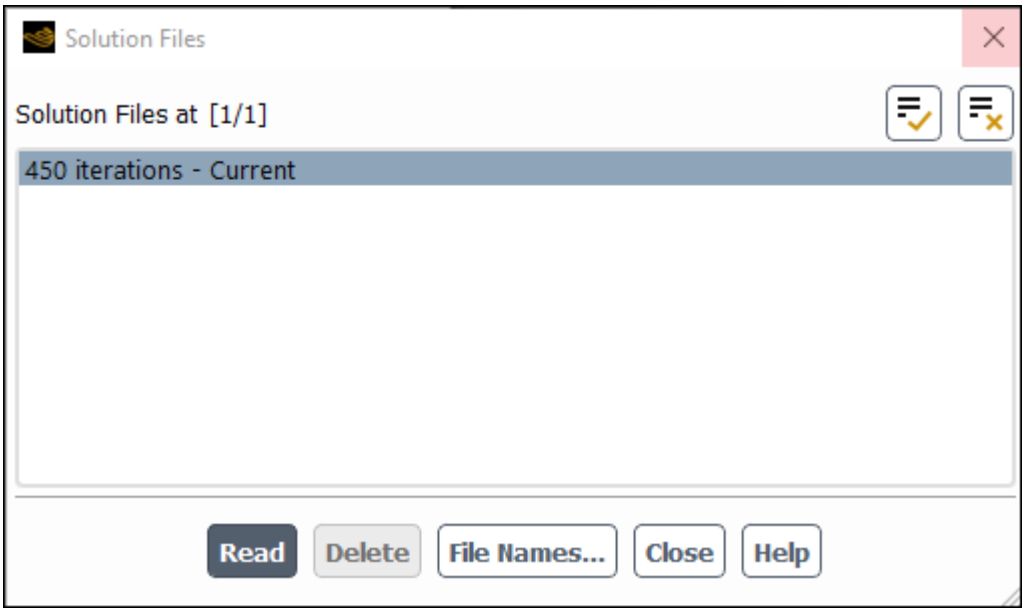
The **File/Solution Files...** ribbon tab item opens the Solution Files Dialog Box (p. 5316).

51.1.64.1. Solution Files Dialog Box

The **Solution Files** dialog box allows you to manage the files that were created through the Autosave Dialog Box (p. 5136). See Managing Solution Files (p. 984) for details.

File → Solution Files...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Solution Files at

contains a selectable list where you can choose the files to read or delete.

Read

makes the selected file the current file. Note that if more than one file is selected, the **Read** button is disabled. When an earlier solution is made current, the solution files that were generated for a later iteration/time-step will be removed from this list when the calculation continues.

Delete

removes the selected solution files.

File Names...

allows you to obtain information about the solution files and the path of the associated files.

Recover Missing Solution...

Recovers the latest case and data files from the system folder (`<project name>\dp0\FFF\Fluent\` for analysis system and `<project name>\dp0\ FLU \Fluent\` for component system) and list them in the **Solution Files at** list. (This option is available only in Fluent used under Workbench.)

51.1.65. File/Interpolate...

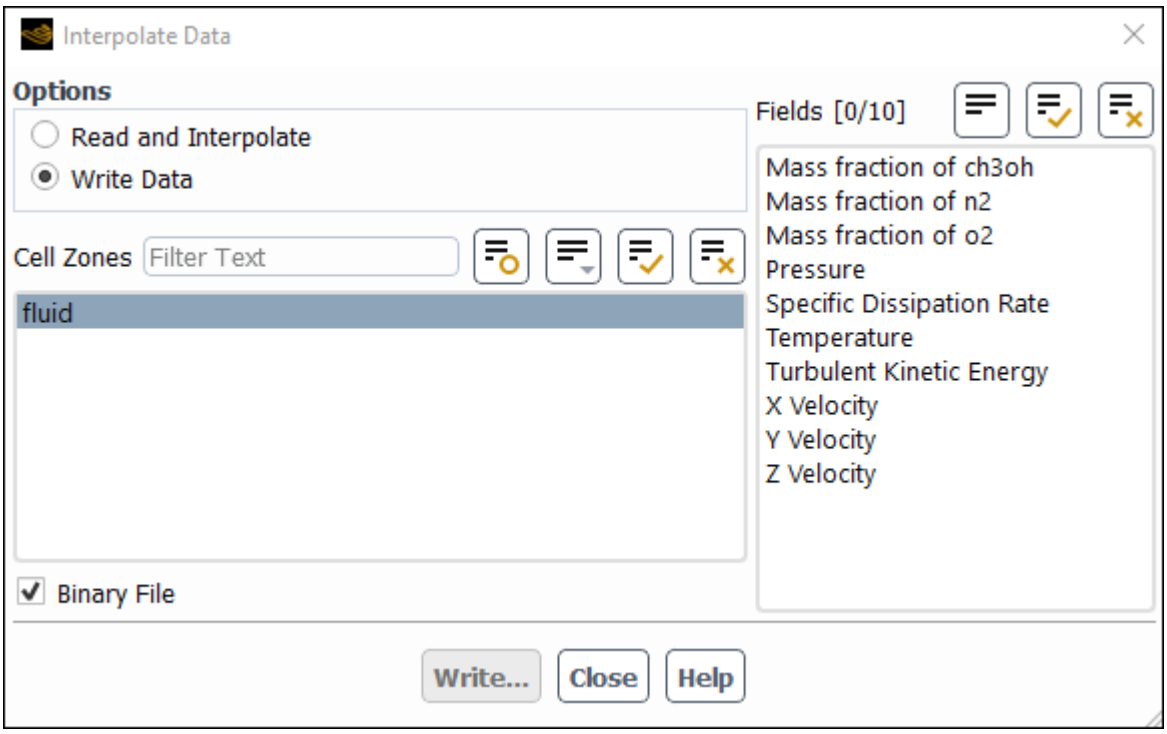
The **File/Interpolate...** ribbon tab item opens the Interpolate Data Dialog Box (p. 5318).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.1.65.1. Interpolate Data Dialog Box

The **Interpolate Data** dialog box allows you to interpolate solution data from one mesh to another. See Mesh-to-Mesh Solution Interpolation (p. 985) for details.

File → Interpolate...



Controls

Options

contains the interpolation options.

Read and Interpolate

allows you to read and interpolate solution data onto the current mesh.

Write Data

allows you to write an interpolation file for the solution data to be interpolated onto another mesh.

Cell Zones

is a list of cell zones that can be selected.

Binary File

allows you to write binary interpolation files. This option is available only when **Write Data** is selected under **Options**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fields

is a list of all available data fields that can be selected. This list is available only when **Write Data** is selected under **Options**.

Read...

opens The Select File Dialog Box (p. 907), in which you can specify the file to be read. This button is available only when the **Read and Interpolate** option is selected.

Write...

opens The Select File Dialog Box (p. 907), in which you can specify a name for the file to be saved and then save the file. This button replaces the **Read...** button when the **Write Data** option is selected.

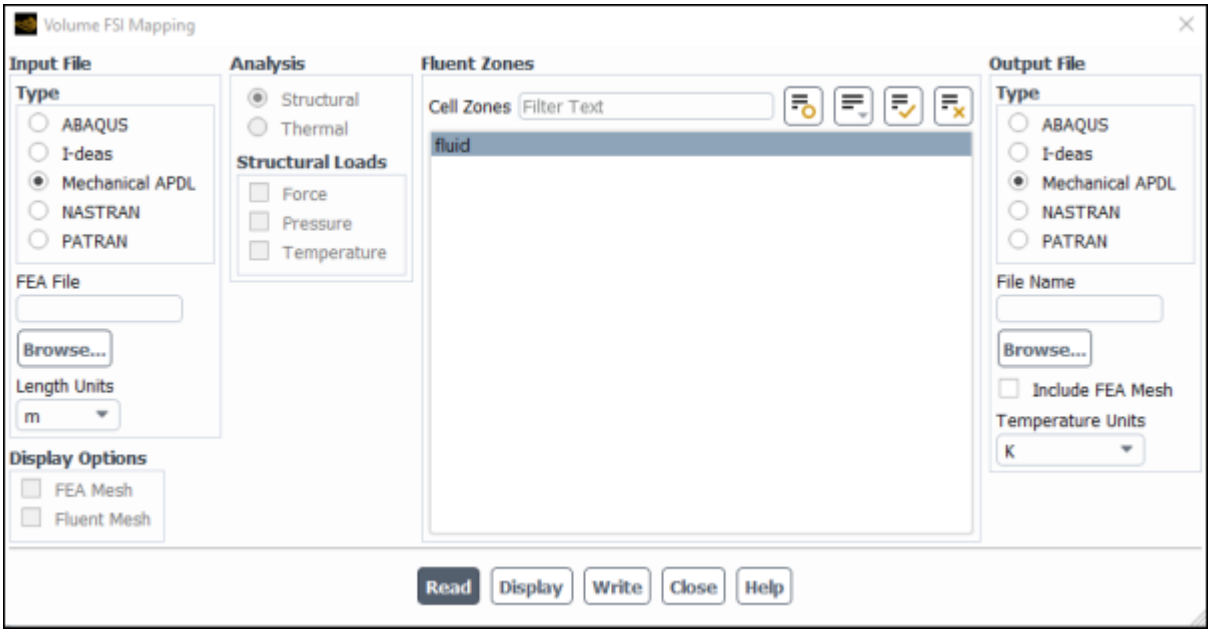
51.1.66. File/FSI Mapping/Volume...

The **File/FSI Mapping/Volume...** ribbon tab item opens the Volume FSI Mapping Dialog Box (p. 5319).

51.1.66.1. Volume FSI Mapping Dialog Box

The **Volume FSI Mapping** dialog box allows you to map cell data for a given geometry from an Ansys Fluent file onto a file with a different mesh and format. See Mapping Data for Fluid-Structure Interaction (FSI) Applications (p. 988) for a complete description of how to use the dialog box.

File → FSI Mapping → Volume...



Controls

Input File

contains parameters related to the input file.

Type

contains the options for the format of the input mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the input mesh file (extension `.inp`).

I-deas

specifies that an I-deas file will be used as the input mesh file (extension `.unv`).

Mechanical APDL

specifies that a Mechanical APDL file will be used as the input mesh file (extension `.cdb` or `.neu`).

NASTRAN

specifies that a NASTRAN file will be used as the input mesh file (extension `.bdf`).

PATRAN

specifies that a PATRAN file will be used as the input mesh file (extension `.neu`, `.out`, or `.pat`).

FEA File

specifies the name of the input mesh file (see the **Input File Type** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...

opens The Select File Dialog Box (p. 907), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Length Units

specifies the unit of length used in the input file.

Display Options

allows you to choose either the **FEA Mesh** or the **Ansys Fluent Mesh** (or both).

Analysis

contains the options for the kind of data to be mapped.

Structural

specifies that data fields relevant for a structural analysis will be mapped.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thermal

specifies that data fields relevant for a thermal analysis will be mapped.

Structural Loads

consists of a list of available loads, including **Force**, **Pressure**, and **Temperature**.

Fluent Zones

contains a list of available cell zones from the current Ansys Fluent file from which cell data will be mapped.

Output File

contains the options for the format of the file that will be created from the input mesh file and the mapped data.

Type

contains the options for the format of the output mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the output mesh file (extension `.inp`).

I-deas

specifies that an I-deas file will be used as the output mesh file (extension `.unv`).

Mechanical APDL

specifies that a Mechanical APDL file will be used as the output mesh file (extension `.cdb`).

NASTRAN

specifies that a NASTRAN file will be used as the output mesh file (extension `.bdf`).

PATRAN

specifies that a PATRAN file will be used as the output mesh file (extension `.out`).

File Name

specifies the name of the output mesh file (see the **Output File** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...

opens The Select File Dialog Box (p. 907), which you can use to specify the output mesh file instead of entering it in the **Output File** text-entry box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Include FEA Mesh

includes additional FEA information like node/element information in the exported output file.

Temperature Units

specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

Read

reads the input file into memory.

Display

displays the selected mesh in the graphics window.

Write

writes an output file in which the selected Ansys Fluent cell data is mapped onto the input mesh file.

51.1.67. File/FSI Mapping/Surface...

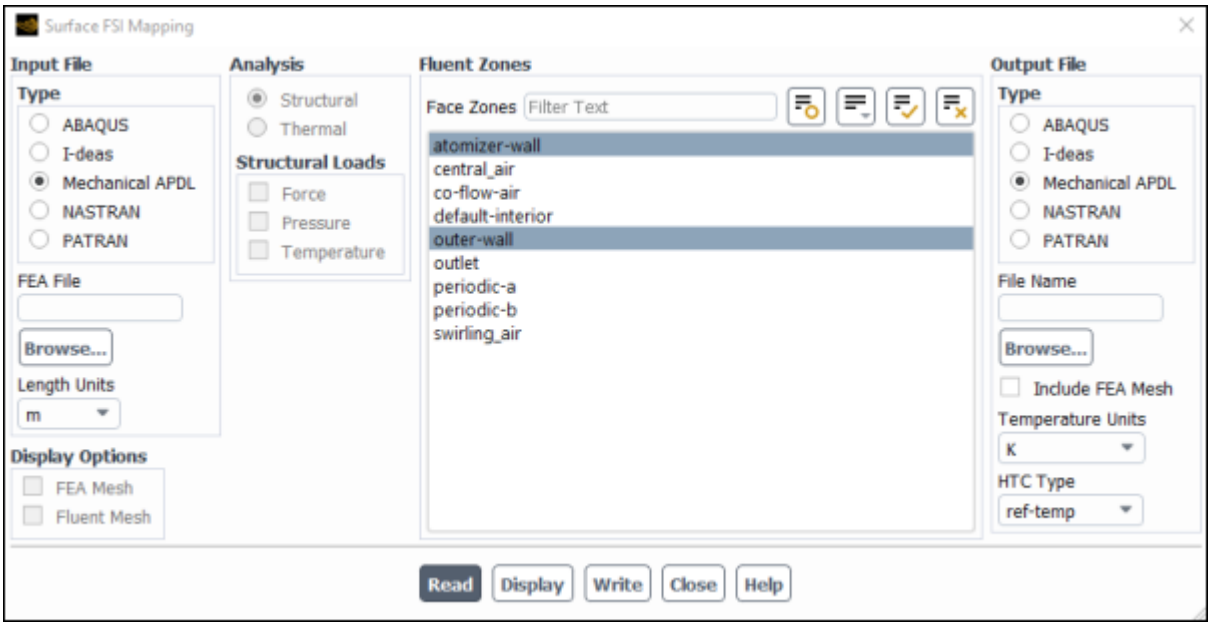
The **File/FSI Mapping/Surface...** ribbon tab item opens the Surface FSI Mapping Dialog Box (p. 5322).

51.1.67.1. Surface FSI Mapping Dialog Box

The **Surface FSI Mapping** dialog box allows you to map face data for a given geometry from an Ansys Fluent file to a file with a different mesh and format. See Mapping Data for Fluid-Structure Interaction (FSI) Applications (p. 988) for a complete description of how to use the dialog box.

File → **FSI Mapping** → **Surface...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Input File

contains parameters related to the input file.

Type

contains the options for the format of the input mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the input mesh file (extension `.inp`).

I-deas

specifies that an I-deas file will be used as the input mesh file (extension `.unv`).

Mechanical APDL

specifies that a Mechanical APDL file will be used as the input mesh file (extension `.cdb` or `.neu`).

NASTRAN

specifies that a NASTRAN file will be used as the input mesh file (extension `.bdf`).

PATRAN

specifies that a PATRAN file will be used as the input mesh file (extension `.neu`, `.out`, or `.pat`).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FEA File

specifies the name of the input mesh file (see the **Input File Type** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...

opens The Select File Dialog Box (p. 907), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Length Units

specifies the unit of length used in the input file.

Display Options

allows you to choose either the **FEA Mesh** or the **Ansys Fluent Mesh** (or both).

Analysis

contains the options for the kind of data to be mapped.

Structural

specifies that data fields relevant for a structural analysis will be mapped.

Thermal

specifies that data fields relevant for a thermal analysis will be mapped.

Structural Loads

consists of a list of available loads, including **Force**, **Pressure**, and **Temperature**.

Fluent Zones

contains a list of available face zones from the current Ansys Fluent file from which cell data will be mapped.

Output File

contains the options for the format of the file that will be created from the input mesh file and the mapped data.

Type

contains the options for the format of the output mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the output mesh file (extension `.inp`).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I-deas

specifies that an I-deas file will be used as the output mesh file (extension `.unv`).

Mechanical APDL

specifies that a Mechanical APDL file will be used as the output mesh file (extension `.cdb`).

NASTRAN

specifies that a NASTRAN file will be used as the output mesh file (extension `.bdf`).

PATRAN

specifies that a PATRAN file will be used as the output mesh file (extension `.out`).

File Name

specifies the name of the input mesh file (see the **Output File** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...

opens The Select File Dialog Box (p. 907), which you can use to specify the output mesh file instead of entering it in the **Output File** text-entry box.

Include FEA Mesh

includes additional FEA information like node/element information in the exported output file.

Temperature Units

specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

HTC Type

specifies the means of calculating the heat transfer coefficient.

ref-temp

uses a temperature equal to the reference temperature to calculate the heat transfer coefficient.

cell-temp

uses a temperature equal to the temperature of the cell adjacent to the face to calculate the heat transfer coefficient.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

wall-func-htc

calculates h_{eff} using Equation 41.69 (p. 4247). Note that this option has the same definition as the field variable **Wall Func. Heat Tran. Coef.**, as described in Alphabetical Listing of Field Variables and Their Definitions (p. 4171).

Read

reads the input file into memory.

Display

displays the selected mesh in the graphics window.

Write

writes an output file in which the Ansys Fluent data has been mapped to the mesh of the input file.

51.1.68. File/Save Picture...

The **File/Save Picture...** ribbon tab item opens the Save Picture Dialog Box (p. 5200).

51.1.69. File/Data File Quantities...

The **File/Data File Quantities...** ribbon tab item opens the Data File Quantities Dialog Box (p. 5138). This is only available when you are writing data files in the legacy format (that is, `.dat` files).

51.1.70. File/Batch Options...

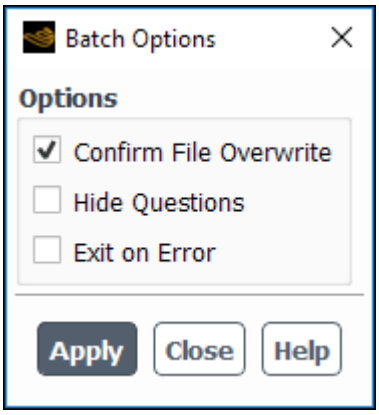
The **File/Batch Options...** ribbon tab item opens the Batch Options Dialog Box (p. 5326).

51.1.70.1. Batch Options Dialog Box

The **Batch Options** dialog box allows you to select options to suppress interactive dialog boxes from Ansys Fluent while running a case in batch mode. For details, see Batch Execution Options (p. 204) in the Getting Started (p. 1) part of this manual.

File → Batch Options...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Confirm File Overwrite

determines whether Ansys Fluent confirms a file overwrite. This option is enabled by default.

Hide Questions

allows you to hide **Question** dialog boxes. This option is disabled by default.

Exit on Error

allows you to automatically exit from batch mode when an error occurs. This option is disabled by default.

When run in batch mode through the command prompt or a journal file with **Exit on Error** enabled, Fluent will exit under the following circumstances:

- Normal run termination upon reaching the end of a journal (return value `0`)
- Error returned during scripted text command execution (return value `1`)
- Unexpected input (wrong type) to text command (return value `1`)
- Licensing error (return value `2`)

If an invalid text command is entered, Fluent will not exit, but proceed to the next text input.

Note that in Windows you must start Fluent with the `-wait` command line option.

51.1.71. File/Idle Timeout...

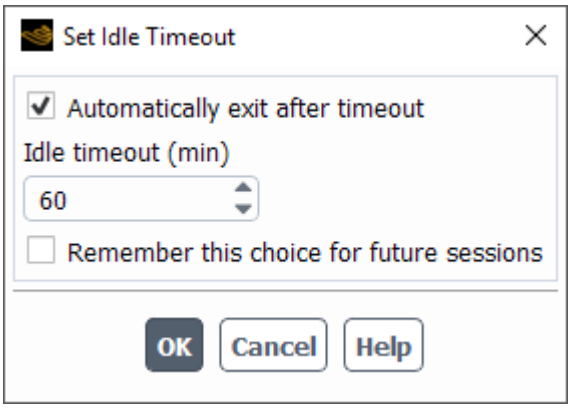
The **File/Idle Timout...** ribbon tab item opens the Set Idle Timeout Dialog Box (p. 5327).

51.1.71.1. Set Idle Timeout Dialog Box

The **Set Idle Timeout** dialog box allows you to specify a time that after which, an idle Ansys Fluent session will close. Refer to Having the Session Close After Sitting Idle (p. 917) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File → Idle Timeout...



Controls

Automatically exit after timeout

enables the idle timer, so that Ansys Fluent will exit after the specified idle time.

Idle timeout (min)

the time after which and idle Ansys Fluent save and exit.

Remember this choice for future sessions

saves the above settings for future sessions. If **Automatically exit after timeout** and **Remember this choice for future sessions** are both enabled when you click **OK**, then next the Ansys Fluent session will have **Automatically exit after timeout** enabled. If **Automatically exit after timeout** is disabled and **Remember this choice for future sessions** is enabled, then the next Ansys Fluent session will not have **Automatically exit after timeout** enabled.

51.1.72. File/Exit

The **File/Exit** ribbon tab item is used to exit from the current solver session.

51.2. Dialog Boxes Available from the Ribbon

The dialog boxes described in this section can be accessed through the ribbon, from the tabs other than the **File** ribbon tab.

51.2.1. 1D Simulation Library Dialog Box
51.2.2. Activate Cell Zones Dialog Box
51.2.3. Adaption Criteria Settings Dialog Box
51.2.4. Adjacency Dialog Box
51.2.5. Advanced Options Dialog Box
51.2.6. Aerodamping (Influence Coefficient Method) Report Definition Dialog Box
51.2.7. Aerodamping (Travelling Wave Method) Report Definition Dialog Box
51.2.8. Animation Definition Dialog Box

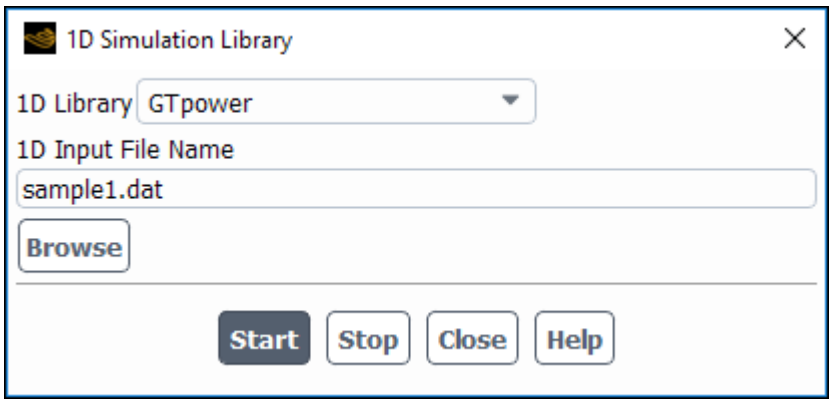
51.2.1. 1D Simulation Library Dialog Box

The **1D Simulation Library** dialog box allows you to set parameters related to coupling between Ansys Fluent and GT-POWER or WAVE. See Coupling Boundary Conditions with GT-POWER (p. 1562) or Coupling Boundary Conditions with WAVE (p. 1567) for details about the items below.

User Defined → Model Specific → 1D Coupling...



Controls

1D Library

specifies the type of library to be used. (Currently only **GTpower** and **WAVE** are available.)

1D Input File Name

specifies the name of the GT-POWER or WAVE input file.

Start

starts up GT-POWER or WAVE and generates Ansys Fluent user-defined functions for each boundary in the input file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stop

unlinks the shared library.

51.2.2. Activate Cell Zones Dialog Box

The **Activate Cell Zones** dialog box allows you to activate a single cell zone or multiple zones. See Activating Zones (p. 1255) for details.

Domain → Zones → Activate...

Controls

Cell Zones

contains a list of cell zones from which you can select the zone to be activated.

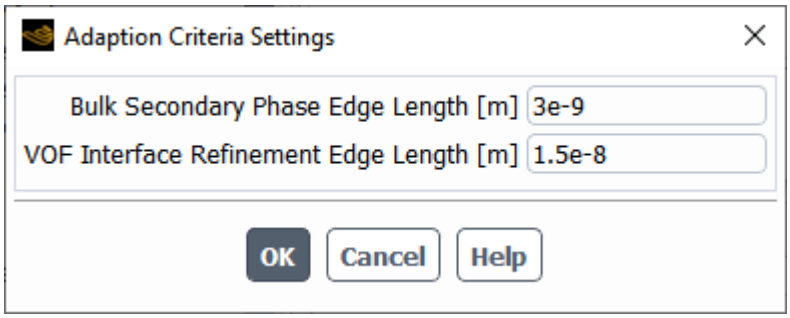
Activate

activates the selected cell zones.

51.2.3. Adaption Criteria Settings Dialog Box

The **Adaption Criteria Settings** dialog box allows you to complete the setup of an adaption criterion when you have made a selection from the **Predefined Criteria** drop-down list in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348); the **Adaption Criteria Settings** dialog box opens automatically, and is used to define necessary settings or parameters in the refinement / coarsening criterion expression or overset adaption settings. See Refining and Coarsening (p. 3759) and Predefined Criteria for Adaption (p. 3766) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

(when setting up the **Cell Distance** predefined criterion under **Boundary Layer...**)

Boundary Zones

specifies the boundary zones where adjacent cell layers will be split for boundary layer adaption. The selections are used in a boundary register named **boundary_cell_distance** that is selected in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459).

Cell Layers to Split

specifies the number of cell layers that will be split for boundary layer adaption. The value you enter is used in a boundary register named **boundary_cell_distance** that is selected in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459).

(when setting up the **Flame Indicator** predefined criterion under **Combustion...**)

Include Vortex Indicator

specifies that the magnitude of vorticity is included as part of the criteria for refinement and coarsening.

Spark Region Refinement

enables refinement in a temporary spherical spark region at the start of the simulation (which will then later be coarsened back to the original mesh).

Time

sets the maximum time during which refinement is applied to the spark region, as part of the **Spark Region Refinement** option. The value you enter will automatically update an expression named **spark**_<*ID*>, which is a parameter in the **flame_refinement**_<*ID*> expression used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Centroid X

sets the x-coordinate for the center of the spark region as part of the **Spark Region Refinement** option. The value you enter will automatically update a cell register named **spark_region**, which is used in an expression named **spark**_<*ID*> that is a parameter in the **flame_refinement**_<*ID*> expression used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Centroid Y

sets the y-coordinate for the center of the spark region as part of the **Spark Region Refinement** option. The value you enter will automatically update a cell register named **spark_region**, which is used in an expression named **spark**_<*ID*> that is a parameter in the **flame_refinement**_<*ID*> expression used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Centroid Z

sets the z-coordinate for the center of the spark region as part of the **Spark Region Refinement** option. The value you enter will automatically update a cell register named **spark_region**, which is used in an expression named **spark**_<*ID*> that is a parameter in the **flame_refinement**_<*ID*> expression used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Radius

sets the radius of the spherical spark region as part of the **Spark Region Refinement** option. The value you enter will automatically update a cell register named **spark_region**, which is used in an expression named **spark**_<*ID*> that is a parameter in the **flame_refinement**_<*ID*> expression used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

(when setting up the **Volume of Fluid** predefined criterion under **Multiphase...**)

Minimum Cell Length Scale

sets the minimum cell length scale for refinement. By default this is set to the minimum cell edge length in the initial mesh. It is used to automatically update the cell volume in an expression named **vof_refinement**_<*ID*> that is used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

(when setting up the **VOF-to-DPM [Generic]** predefined criterion under **Multiphase...**)

Number of Cells Across Resolved Droplet

sets the number of cells across the resolved droplet (N). It is used to automatically update the cell volume (as described in the definition that follows) used in the **vof_to_dpm_refinement**_<*ID*> expression that is used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Minimum Resolved Droplet Diameter

sets the minimum diameter of droplets that are resolved in the simulation (D). By default this is set to the minimum cell edge length in the initial mesh. It is used (with the **Number of Cells Across Resolved Droplet** setting) to automatically update the cell volume used in the **vof_to_dpm_refinement**_<*ID*> expression, by setting it to $\left(D/N\right)^3$. This expression is then used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

(when setting up the **VOF-to-DPM [Advanced]** predefined criterion under **Multiphase...**)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bulk Secondary Phase Edge Length

specifies an edge length that is cubed in order to define the minimum cell volume that initiates refinement in the secondary phase. This volume is used in an expression named **vof_to_dpm_refinement_1** that is used in the **Refinement Criterion** field in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

VOF Interface Refinement Edge Length

specifies an edge length that is cubed in order to define minimum / maximum cell volume that initiates refinement / coarsening at the VOF interface. This volume is used in expressions named **vof_to_dpm_refinement_1** and **vof_to_dpm_coarsening_1**, which are then used in the **Refinement Criterion** and **Coarsening Criterion** fields, respectively, in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

(when setting up the **Overset** predefined criterion)

Orphan Adaption

enables adaption that attempts to remove orphan cells. For details, see Marking for Orphan Adaption (p. 1196).

Size Adaption

enables adaption that reduces size mismatches between donor and receptor cells. For details, see Marking for Size Adaption (p. 1196).

Maximum Length Scale Ratio

sets the threshold (R_l) used as part of the **Size Adaption** option to determine which cells are marked for adaption based on donor-receptor cell size differences. This is set to 3 by default.

Gap Adaption

enables adaption that increases the mesh resolution in gaps as needed (in order to prevent the creation of orphan cells). For details, see Marking for Gap Adaption (p. 1196).

Gap Resolution

specifies the target (minimum) gap resolution used as part of the **Gap Adaption** option when marking cells for gap adaption. This is set to 4 by default.

Coarsening

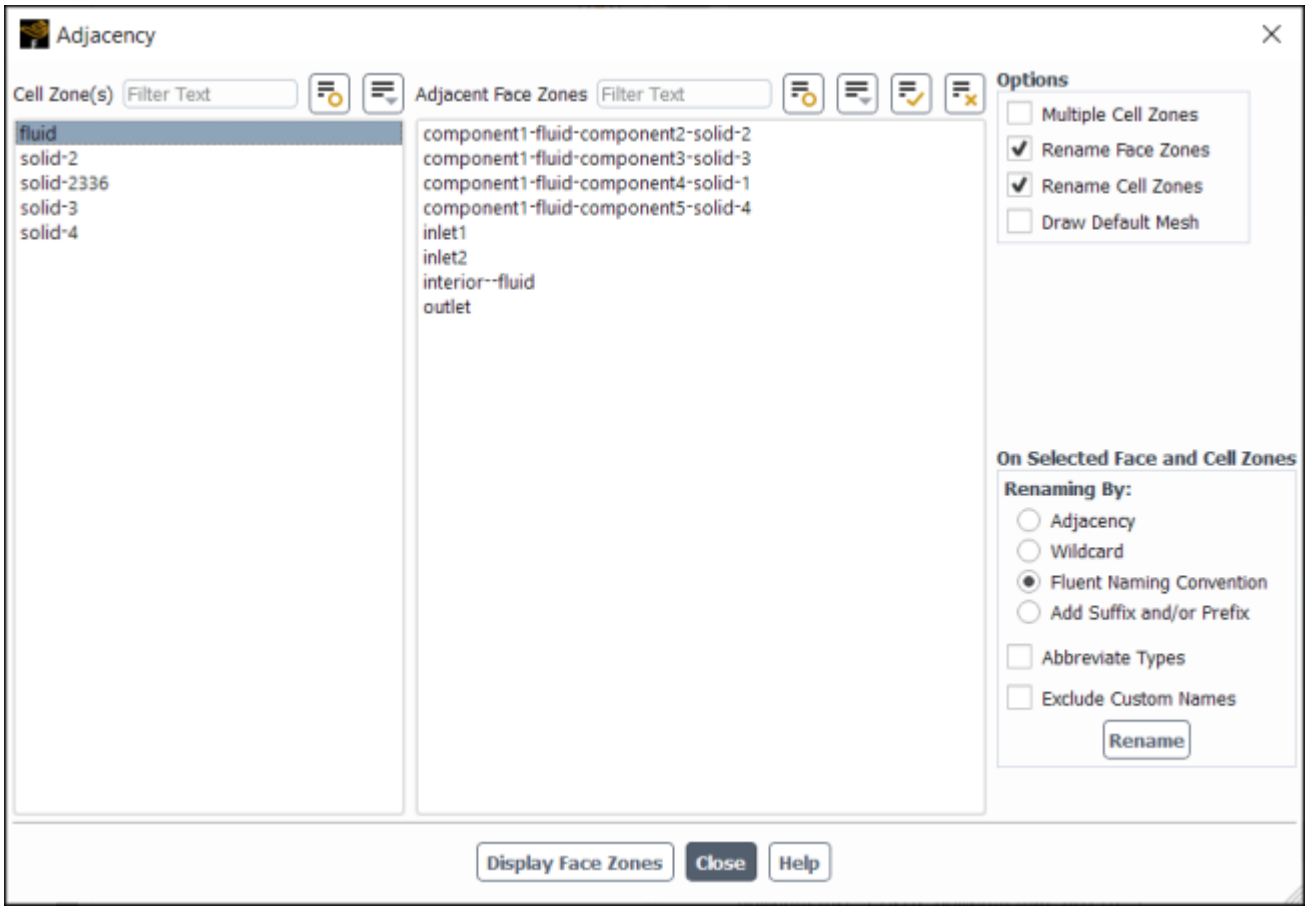
enables the coarsening of the mesh when mesh refinement is no longer needed.

51.2.4. Adjacency Dialog Box

The **Adjacency** dialog box allows you to identify, display, and rename face zones based on their adjacency to a selected cell zone. You can also rename cell zones by zone type and ID, by wildcard, and by adding prefixes/suffixes. See Managing Adjacent Zones (p. 1258) for details.

Domain → Zones → Adjacency...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Cell Zone(s)

contains a list of the cell zones for which you can find adjacent face zones.

Adjacent Face Zones

contains a list of the face zones that are adjacent to the selected cell zones.

Options

contains relevant options for adjacency.

Multiple Cell Zones

allows you to select multiple cell zones at once. The zones listed in **Adjacent Face Zones** will be the union of all zones adjacent to the selected cell zones.

Rename Face Zones

allows you to rename selected face zones based on adjacency, zone type, wild card, or add a prefix/suffix.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rename Cell Zones

allows you to rename selected cell zones based zone type and ID, wild card, or by adding a prefix/suffix.

Draw Default Mesh

brings up the Mesh Display Dialog Box (p. 4636) where you can specify zones of the mesh to be permanently displayed as you display or hide face zones from within the **Adjacency** dialog box. This can be helpful in cases where the mesh is very complex. If this option is not enabled, only the zones selected in **Adjacent Face Zones** will be displayed when you click **Display Face Zones**.

On Selected Face Zones

contains controls for renaming face zones that are selected in **Adjacent Face Zones**. For details on the renaming methods, refer to Renaming Zones Using the Adjacency Dialog Box (p. 1260).

Renaming By:

contains options for how you can rename surfaces.

Adjacency

renames the selected face zones incorporating the name of the adjacent cell zone and the face zone type when you click **Rename**.

Fluent Naming Convention

renames the selected surface to be a combination of the surface type and the surface ID when you click **Rename**. Cell zones are renamed to be a combination of the zone type and the zone ID.

Wildcard

renames the selected face zones or cell zones based on a pattern match string in the **From** field and a replacement string in the **To** field.

Add Suffix and/or Prefix

adds the provided text in the **Suffix or Prefix** field to either the beginning or end of the selected zone name(s). Click **Add Suffix** to add the provided text at the end of the name and click **Add Prefix** to add the provided text at the beginning of the name.

Abbreviate Types

uses abbreviations for the zone types when renaming rather than the full zone type text.

Exclude Custom Names

excludes from renaming any zones that do not match a recognized naming pattern. This can be useful to prevent inadvertently replacing a meaningful name.

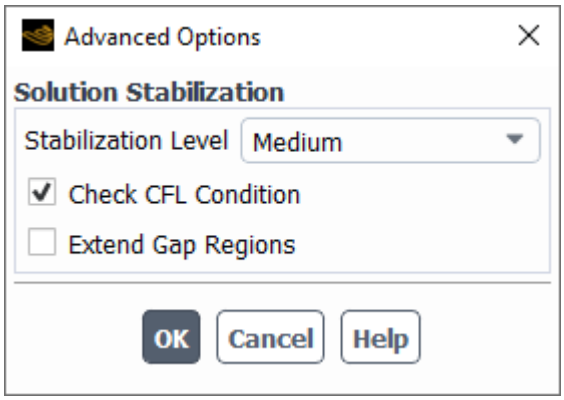
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Displace Face Zones

displays the face zones selected in **Adjacent Face Zones**.

51.2.5. Advanced Options Dialog Box

The **Advanced Options** dialog box provides advanced options for a simulation that uses the gap model to simulate flow through narrow gaps that open or close over time (such as in a valve). It is opened by clicking **Advanced Options...** in the Gap Model Dialog Box (p. 5428). See also Controlling Flow in Narrow Gaps for Valves and Pumps (p. 1211).



Controls

Solution Stabilization

allows you to define solution stabilization settings for the gap model.

Stabilization Level

allows you to define the level of solution stabilization for the gap model simulation. For each level, the solver adjusts the numerical settings, discretization schemes, under-relaxations, AMG settings, and so on, and controls the flow behavior in vicinity of the gap regions. The cost of computation increases with higher levels. Note that these changes are applied globally to all gap regions, and a level other than **None** will override the local stabilization applied by default to flow-modeling regions that use the **Sponge Layer** method.

Check CFL Condition

enables the automatic determination of a desirable acoustic Courant (CFL) number based on the selected **Stabilization Level**, and then provides a warning message in the console if this CFL number would require you to specify a smaller time step for the calculation in order to improve the solver stability.

Extend Gap Regions

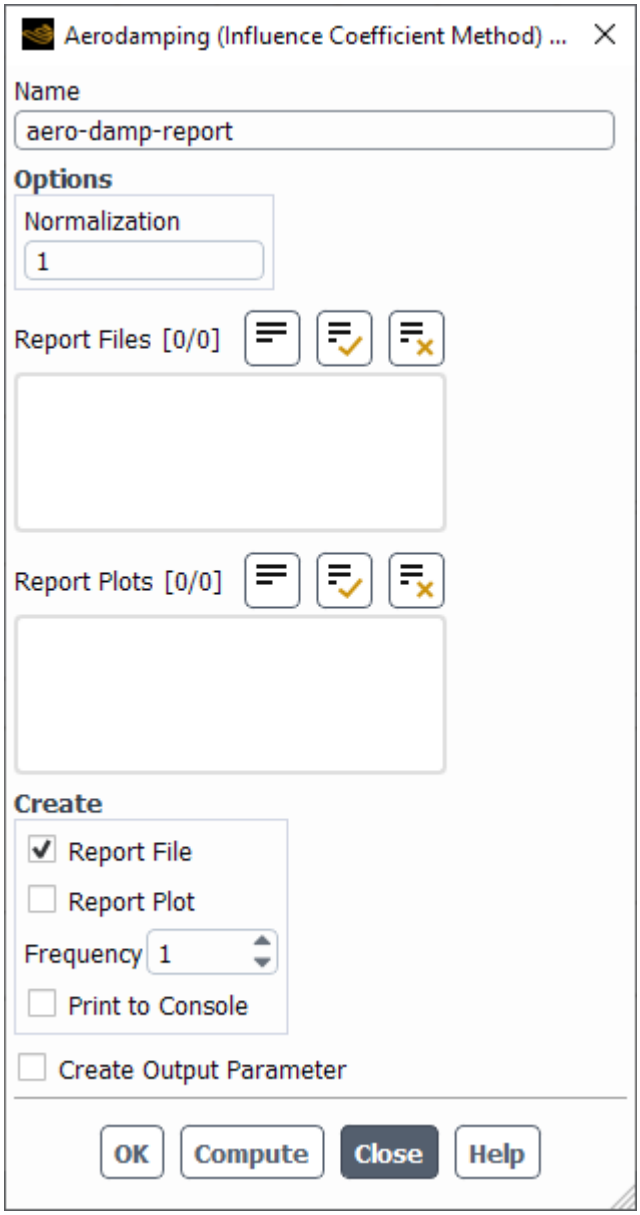
enables the extending of the gap regions by including additional cells in the vicinity of the gap interfaces during marking. This is useful when the default shape of the marked cells is negatively affecting solution stability or convergence behavior.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.6. Aerodamping (Influence Coefficient Method) Report Definition Dialog Box

For more details, see ICM Method Post-processing (p. 1967).

Solution → Reports → Definitions → New → Aeromechanics Report → Aerodamping (Influence Coefficient Method)...



Controls

Name

specifies the name of the report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

contains options for your aerodamping report definition.

Normalization

Sets the normalization factor for the damping value.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

OK

creates the report definition.

Compute

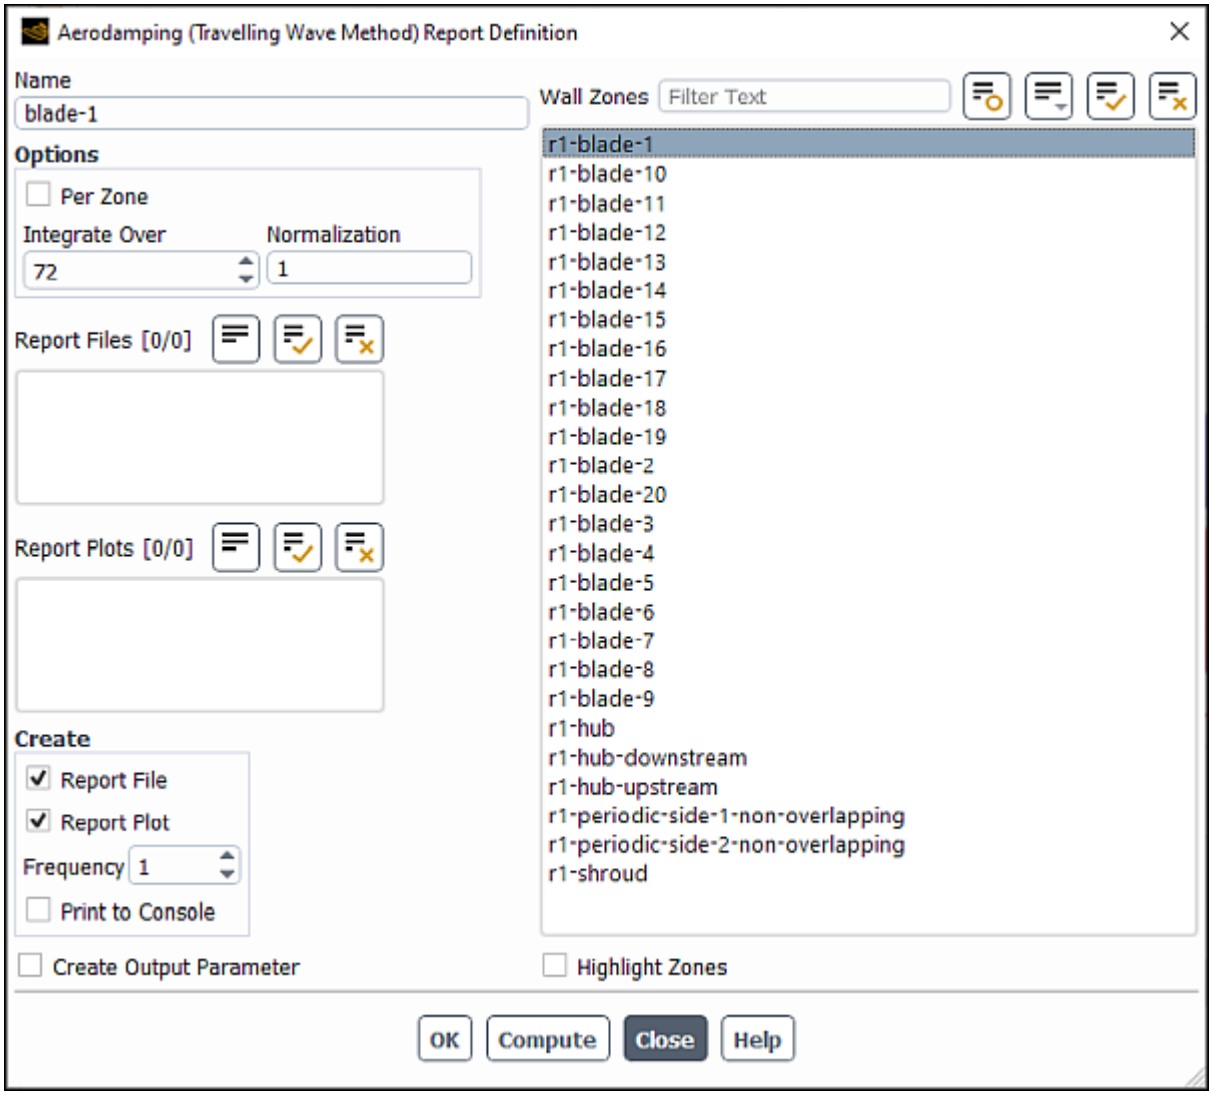
computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.7. Aerodamping (Travelling Wave Method) Report Definition Dialog Box

For more details, see TWM Method Post-processing (p. 1964).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solution → Reports → Definitions → New → Aeromechanics Report → Aerodamping (Travelling Wave Method)...



Controls

Name

specifies the name of the report definition.

Options

contains options for your aerodamping report definition.

Per Zone

If you are modeling multiple (main) blades, enables the damping value to be calculated for each dynamic mesh zone (which encompasses one main blade and possibly accompanying splitter blades).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Integrate Over

sets the number of time steps over which to integrate when calculating the damping value; a suggested value is the number of time steps per period..

Normalization

Sets the normalization factor for the damping value.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Wall Zones

contains a selectable list of valid walls zones for aerodamping report.

OK

creates the report definition.

Compute

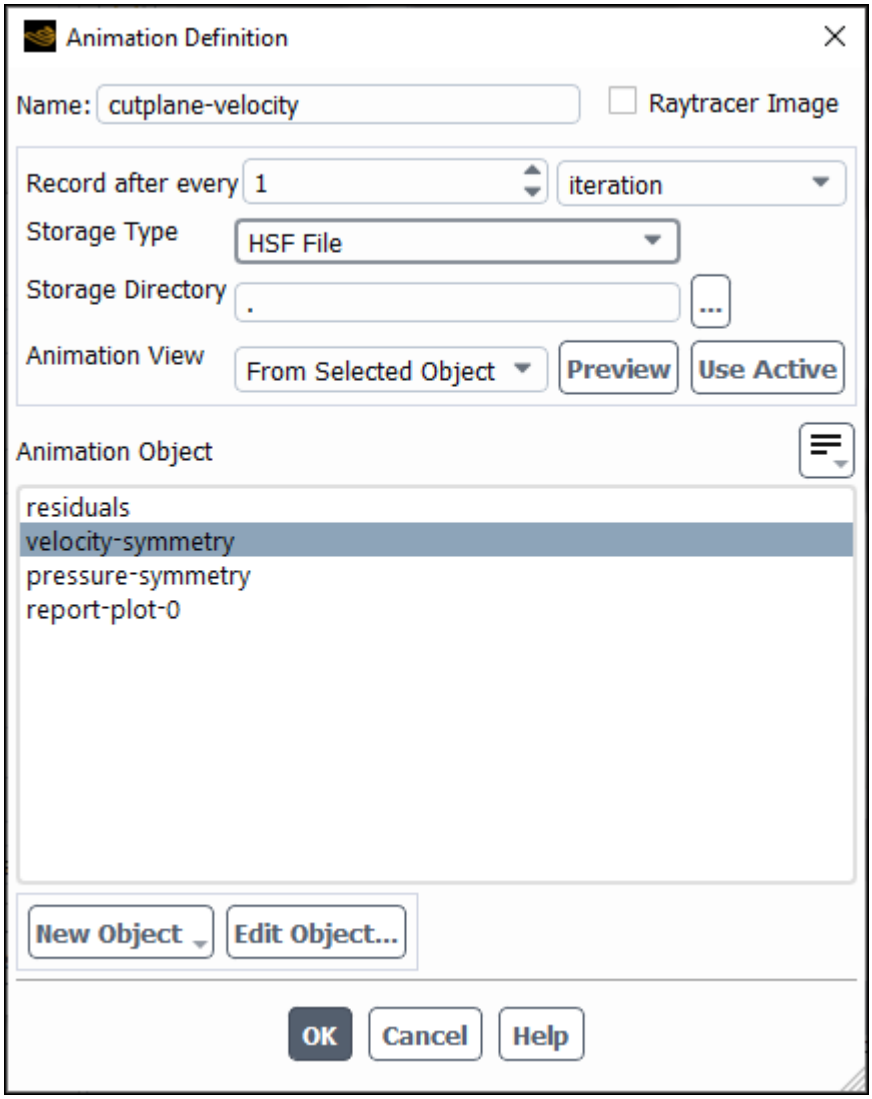
computes the value of the report definition at the selected zone(s) and prints to the console.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.8. Animation Definition Dialog Box

The **Animation Definition** dialog box allows you to specify a graphics object that will be captured during the solution calculation so that it may be played back as an animation during postprocessing.

Solution → Activities → Create → Solution Animations...



Controls

Name

name of the animation definition.

Raytracer Image

indicates that animation images will use a raytracing renderer for enhanced image quality. Refer to Realistic Rendering Using Raytracing (p. 3965) for additional information on raytracing.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Record after every

specifies the frequency that images are captured during the calculation. You can select whether the frequency is **Iteration**, **Time Step** (transient only) or **Flow Time** (transient only) from the drop-down.

Storage Type

drop-down list with the available formats for storing the animation images.

None

no images are saved. This option is intended for use with embedded window dashboards (Embedded Graphics Window Dashboards (p. 3914)).

In Memory

the image files associated with the animation will lost when you exit Fluent.

PPM Image

Fluent will save the animation images in PPM Image format (`.ppm`), which is 2D.

HSF File

Fluent will save the animation images in HSF file format (`.hsf`), which is 3D.

PNG Image

Fluent will save the animation images in PNG file format (`.png`), which is 2D.

JPEG Image

Fluent will save the animation images in JPEG file format (`.jpg`), which is 2D.

TIFF Image

Fluent will save the animation images in tagged image file format (TIFF—`.tif`), which is 2D.

Storage Directory

shows the location where the animation images will be stored if the **Storage Type** is set to any of the types other than **In Memory**.

Note:

Animation files are written to the same directory as the case file, by default. This is stored as a relative path, represented by a dot (.), so that when a case file is shared, animation files are written to an appropriate location.

If you manually specify a path, then what you are specifying is an absolute path that will not automatically be updated if the case file is shared or run from another directory.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Animation View

specifies the animation object orientation that will be used when the animation images are capture during the calculation.

views drop-down

list with all of the defined views.

Preview

displays the selected animation object in a reserved graphics window.

Use Active

saves the current view in the active graphics window and automatically selects it for use in the animation definition.

Animation Object

lists the defined graphics objects that may be selected for animation.

New Object

drop-down list allowing you to create new graphics objects for animating.

- **Mesh...** opens the Mesh Display Dialog Box (p. 4636).
- **Contours...** opens the Contours Dialog Box (p. 5357).
- **Vectors...** opens the Vectors Dialog Box (p. 5597).
- **Pathlines...** opens the Pathlines Dialog Box (p. 5515).
- **Particle Tracks...** opens the Particle Tracks Dialog Box (p. 5501).
- **Scene...** opens Figure 39.44: The Scene Dialog Box (p. 3909).
- **XY Plot...** opens the Solution XY Plot Dialog Box (p. 5236).
- **Report Plot...** opens the New Report Plot Dialog Box (p. 5495).

Edit Object...

allows you to edit the selected graphics object.

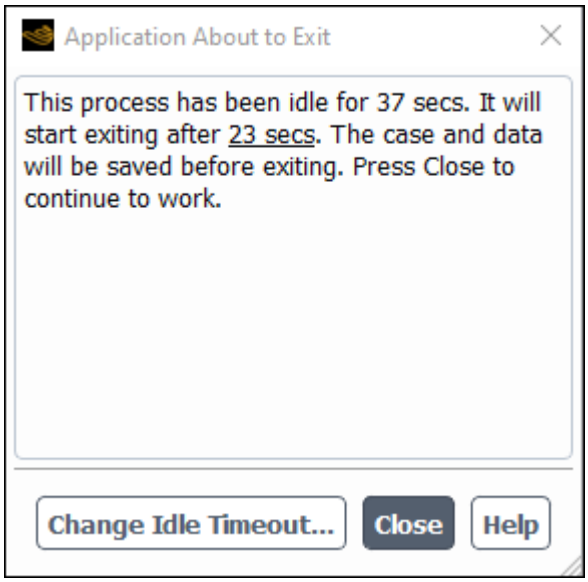
OK

creates the animation definition and/or saves settings changes and closes the dialog box.

51.2.9. Application About to Exit Dialog Box

The **Application About to Exit** dialog box gives you chance to stop the Ansys Fluent session from saving and exiting as the session approaches the idle timeout set in the Set Idle Timeout Dialog Box (p. 5327). Refer to Having the Session Close After Sitting Idle (p. 917) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

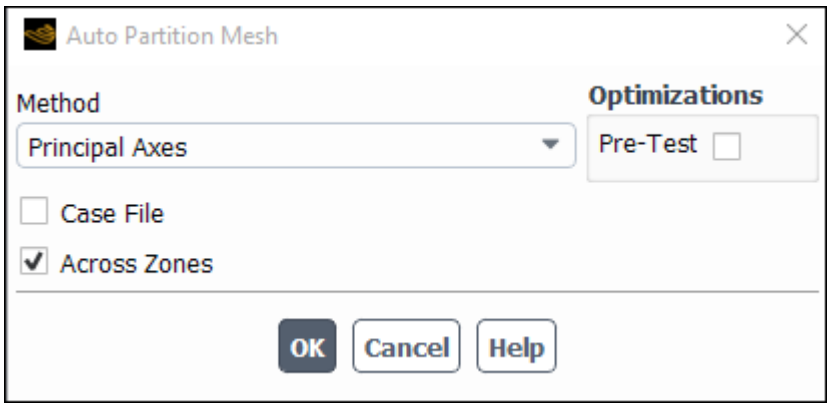
Change Idle Timeout...

opens the Set Idle Timeout Dialog Box (p. 5327).

51.2.10. Auto Partition Mesh Dialog Box

The **Auto Partition Mesh** dialog box allows you to set the parameters for automatic partitioning when reading an unpartitioned mesh into the parallel solver. See Partitioning the Mesh Automatically (p. 4282) for details.

Parallel → General → Auto Partition...



Controls

Method

contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the **Cartesian Axes**, **Cartesian Strip**, **Cartesian X-Coordinate**, **Cartesian Y-Coordinate**, **Cartesian Z-Coordinate**, **Cartesian R Axes**, **Cartesian RX-Coordinate**, **Cartesian RY-Coordinate**, **Cartesian RZ-Coordinate**, **Cylindrical Axes**, **Cylindrical R-Coordinate**,

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cylindrical Theta-Coordinate, **Cylindrical Z-Coordinate**, **Metis**, **Polar Axes**, **Polar R-Coordinate**, **Polar Theta-Coordinate**, **Principal Axes**, **Principal Strip**, **Principal X-Coordinate**, **Principal Y-Coordinate**, **Principal Z-Coordinate**, **Spherical Axes**, **Spherical Rho-Coordinate**, **Spherical Theta-Coordinate**, and **Spherical Phi-Coordinate** techniques, which are described in Mesh Partitioning Methods (p. 4297).

Case File

allows you to use a valid existing partition section in a case file (that is, one where the number of partitions in the case file divides evenly into the number of compute nodes). You need to turn off the **Case File** option only if you want to change other parameters in the **Auto Partition Mesh** dialog box.

Across Zones

allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended *only* when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Optimizations

contains an option to enable pre-testing.

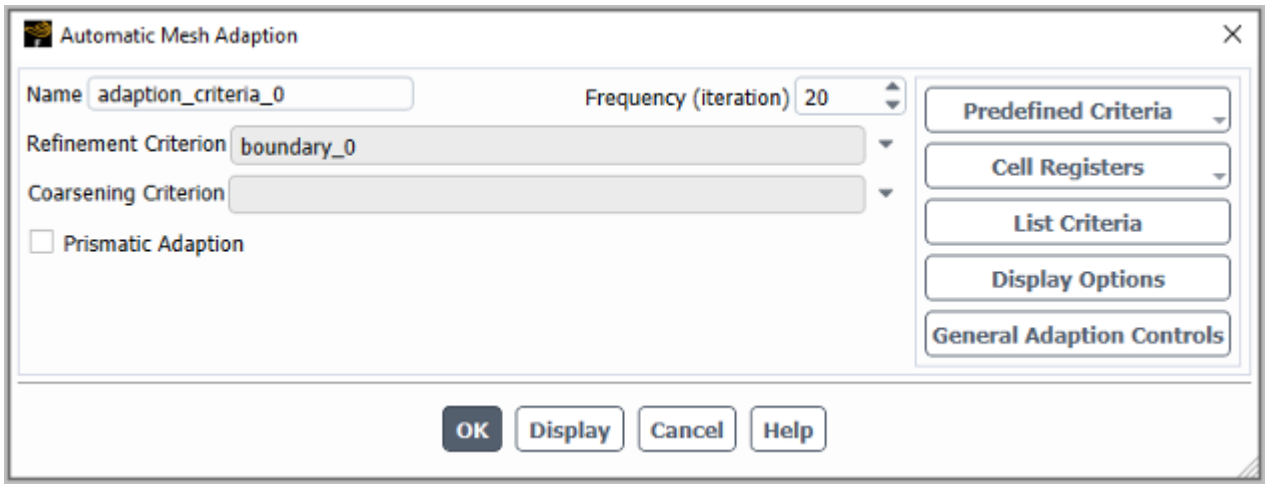
Pre-Test

instructs Fluent to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose **Principal Axes** or **Cartesian Axes** as the partitioning method.

51.2.11. Automatic Mesh Adaption Dialog Box

The **Automatic Mesh Adaption** dialog box allows you to create and edit criteria that Fluent will use to adapt your mesh during a calculation. See Refining and Coarsening (p. 3759) for details.

Domain → Adapt → Automatic...



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Name

specifies the name of the adaption criteria.

Frequency

defines the frequency of the adaption that will be applied for this criteria during the calculation.

Refinement Criterion

specifies the cell register or expression that Fluent will use during the calculation to determine which cells to refine.

Coarsening Criterion

specifies the cell register or expression that Fluent will use during the calculation to determine which cells to coarsen.

Prismatic Adaption

specifies that prismatic cells are adapted anisotropically. This option is only available with the PUMA adaption method.

Predefined Criteria

allows you to select from a list of commonly used criteria for adapting the mesh (for a description of the list, see Predefined Criteria for Adaption (p. 3766)); if one is selected, Fluent will automatically generate cell registers and/or expressions for refinement and coarsening, and define the settings in the **Automatic Mesh Adaption** dialog box and General Adaption Controls Dialog Box (p. 5430) as needed. Depending on your selection, you may be prompted to complete the setup by defining fields in the Adaption Criteria Settings Dialog Box (p. 5333).

Cell Registers

allows you to create new cell registers and manage existing ones, which may then be selected from the **Refinement Criterion** and/or **Coarsening Criterion** drop-down lists.

List Criteria

prints to the console the number of cells marked for refinement, the number of cells marked for coarsening, and the number marked for both operations.

Display Options

opens the Display Options - Adaption Dialog Box (p. 5379).

General Adaption Controls

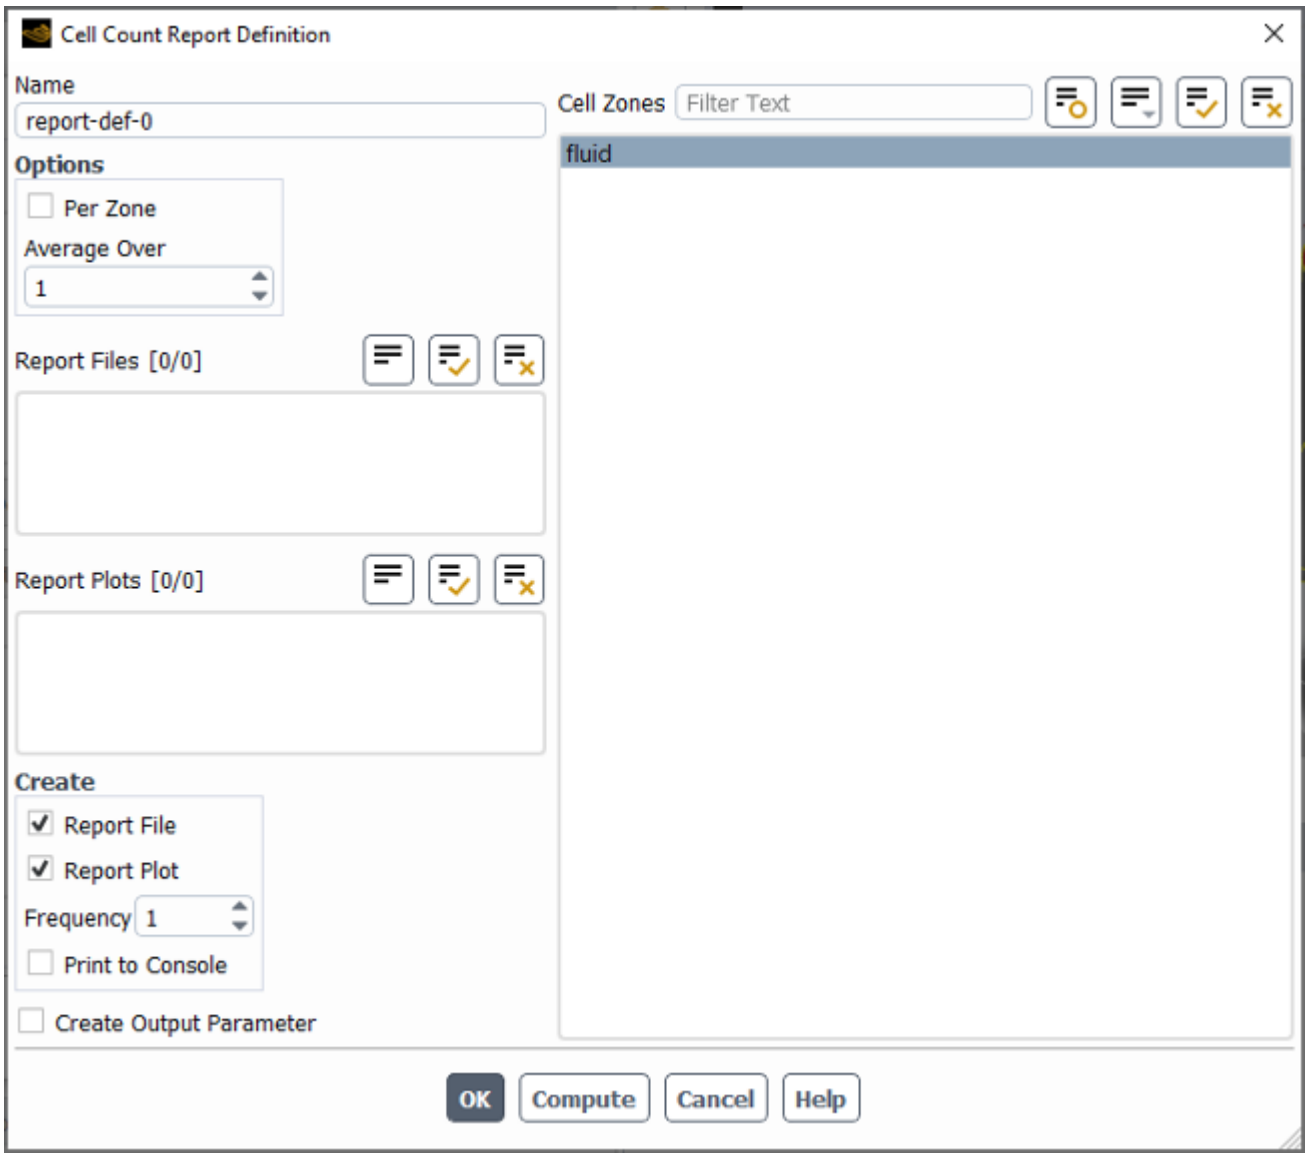
opens the General Adaption Controls Dialog Box (p. 5430), where you can specify the general settings that Fluent uses when adapting the mesh.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.12. Cell Count Report Definition Dialog Box

The **Cell Count Report Definition** dialog box allows you to create a report definition for the reporting of a cell count (that is, the number of cells within one or more cell zones), as described in Mesh Report Definitions (p. 4080).

Solution → Reports → Definitions → New → Mesh Report → Cell Count...



Controls

Name

specifies the name of the report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

Per Surface

enables the reporting of the cell count individually for each of the selected zones (rather than reporting the sum from all of the selected zones).

Average Over

specifies the number of iterations / time steps over which the cell count is averaged when written, plotted, and/or printed. The default value of 1 means that no averaging is performed (that is, only the current cell count is reported), and higher values yields a running average. When the iteration / time step number is lower than the specified value, Fluent calculates the average of the available cell count values.

Retain Instantaneous Values

enables the retention of instantaneous values in any report file definition or report plot definition that is associated with this report definition. This option is only available if **Average Over** is set to a value greater than 1.

Report Files

allows you to select existing report file definitions to which you want to write cell count data from this report definition.

Report Plots

allows you to select existing report plot definitions to which you want to include cell count data from this report definition. Note that the units used in these report plots may not be suitable for the cell count data.

Create

Report File

creates a new report file definition for the data from this report definition.

Report Plot

creates a new report plot definition for the data from this report definition.

Frequency

specifies how frequently the report definition is written, plotted, and/or printed to the console.

Print to Console

enables the printing of the cell count data from this report definition to the console during the calculation.

Create Output Parameter

creates an output parameter for this report definition with the name <*report_definition_name*>-op.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cell Zones

allows you to select the cell zones for which you want to report the number of cells.

OK

creates / saves the report definition.

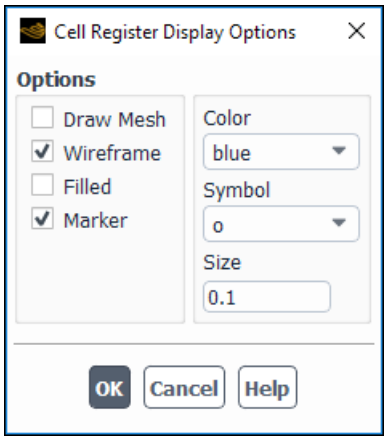
Compute

computes the cell count within the selected zone(s) and prints to the console.

51.2.13. Cell Register Display Options Dialog Box

The **Cell Register Display Options** dialog box allows you to customize the display of cell registers.

You can access this dialog box by clicking **Display Options...** in any of the cell register dialog boxes.



Controls

Options

contains check buttons that control the drawing of the mesh and the type of graphical tool used to display register cells.

Draw Mesh

toggles the ability to draw the mesh with the cell register display. This command opens the Mesh Display Dialog Box (p. 4636), which allows you to select the desired surface or zone meshes to be displayed with the register cells.

Wireframe

toggles the display of the cell wireframe.

Filled

toggles the solid shading of the cell wireframe.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Marker

toggles the display of the cell marker.

Color

is a drop-down list of colors for the wireframe or marker for the cells.

Symbol

is a drop-down list of symbols that can be used cell marker.

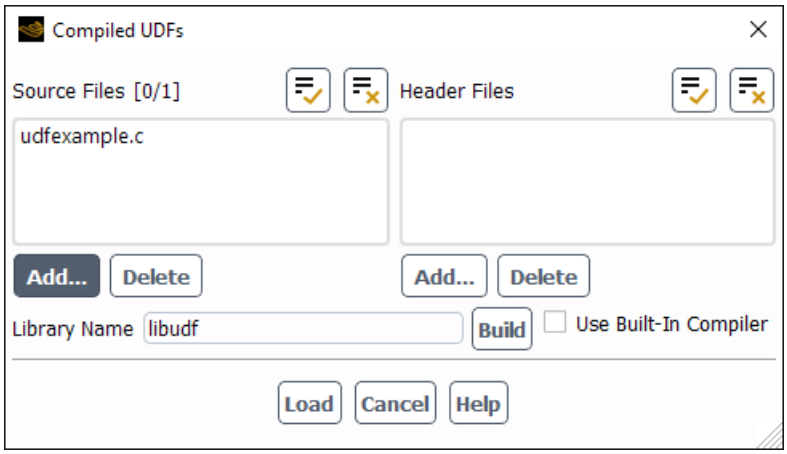
Size

is a real number entry for the size of the cell marker. A symbol of size 1.0 is 3.0% of the height of the display screen.

51.2.14. Compiled UDFs Dialog Box

The **Compiled UDFs** dialog box allows you to open a library of compiled user-defined functions. See the separate Fluent Customization Manual for details.

User Defined → User Defined → Functions → Compiled...



Controls

Source Files

contains a list of source files.

Header Files

contains a list of header files.

Add...

opens the **Select File** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

deletes the selected file from the list.

Library Name

specifies the name of the library to be created.

Use Built-In Compiler

enables the use of a built-in compiler (Clang) when the **Build** button is clicked. This option / compiler is available for Windows only, and is provided as part of the Fluent installation. It is recommended that you enable this option when the compiler you installed on your machine is older and no longer supported. Note that the built-in compiler is used automatically if Fluent determines that you have not installed Microsoft Visual Studio or Clang on your computer, whether this option is enabled or not.

Build

builds the library and compiles the user-defined function.

Load

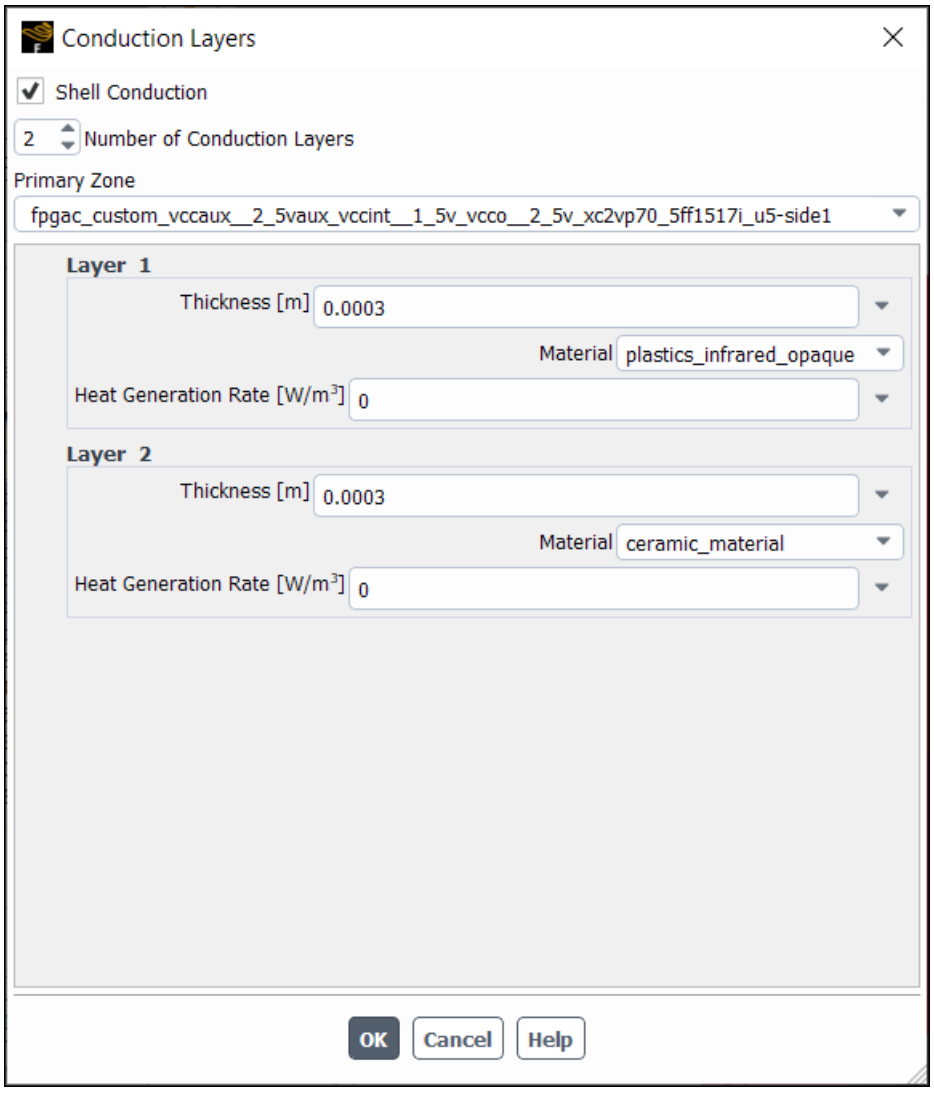
opens the specified library and loads the user-defined function.

51.2.15. Conduction Layers Dialog Box

The **Conduction Layers** dialog box allows you to define the conduction settings for either a single **Wall** dialog box or all of the walls selected in the **Wall Zones** list of the Conduction Manager Dialog Box (p. 5356). See Shell Conduction (p. 1452) and Managing Conduction Walls (p. 2148) for details about the items below.

The **Conduction Layers** dialog box is opened from either the Wall Dialog Box (p. 5031) or the Conduction Manager Dialog Box (p. 5356).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Shell Conduction

enables/disables shell conduction for the selected wall(s).

Number of Shell Conduction Layers

allows you to define the number of layers that make up the wall(s).

Primary Zone

sets a wall to copy conduction settings from to the other selected walls.

Layer 1, Layer 2...

allows you to define the settings for each layer. Note that **Layer 1** refers to the layer closest to the fluid / solid adjacent to the wall zone, and layers with higher numbers are further away.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Thickness

sets the thickness of the layer for the calculation of the thermal resistance. Each layer must have a nonzero thickness. Note that non-shell walls with a specified **Thickness** will be treated as thin walls.

Material Name

sets the material type for the layer/wall. The conductivity of the material is used for the calculation of thermal resistance. Materials are defined using the Materials Task Page (p. 4831).

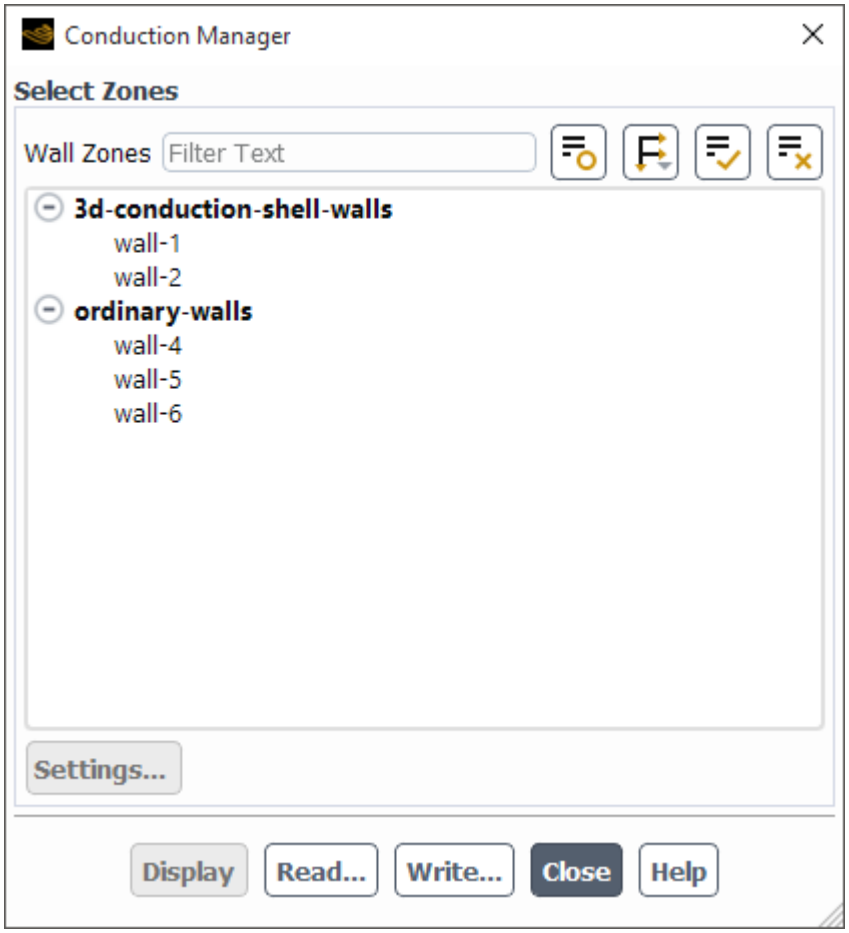
Heat Generation Rate

sets the rate of heat generation in the layer. Note that you have the option of defining the heat generation rate using a user-defined function (UDF) that utilizes the `DEFINE_PROFILE` macro; for more information on creating and using user-defined functions, see the Fluent Customization Manual.

51.2.16. Conduction Manager Dialog Box

The **Conduction Manager** dialog box allows you to manage, define, and display conduction zones all in one location.

Physics → **Model Specific** → **Conduction Manager...**



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Select Zones

contains the list of conduction zones (1d thin walls and 3d shell walls) and ordinary walls.

Wall Zones

contains a list of wall zones.

Settings...

opens the Conduction Layers Dialog Box (p. 5354), where you can define the conduction properties of the walls selected in the **Wall Zones** list.

Display

displays the selected walls in the graphics window.

Read...

allows you to define your conduction settings by reading a `.csv` file.

Write...

allows you to write your saved conduction settings to a `.csv` file.

51.2.17. Contours Dialog Box

The **Contours** dialog box controls the display of contour and profile plots. See Displaying Contours and Profiles (p. 3874) for details about the items below.

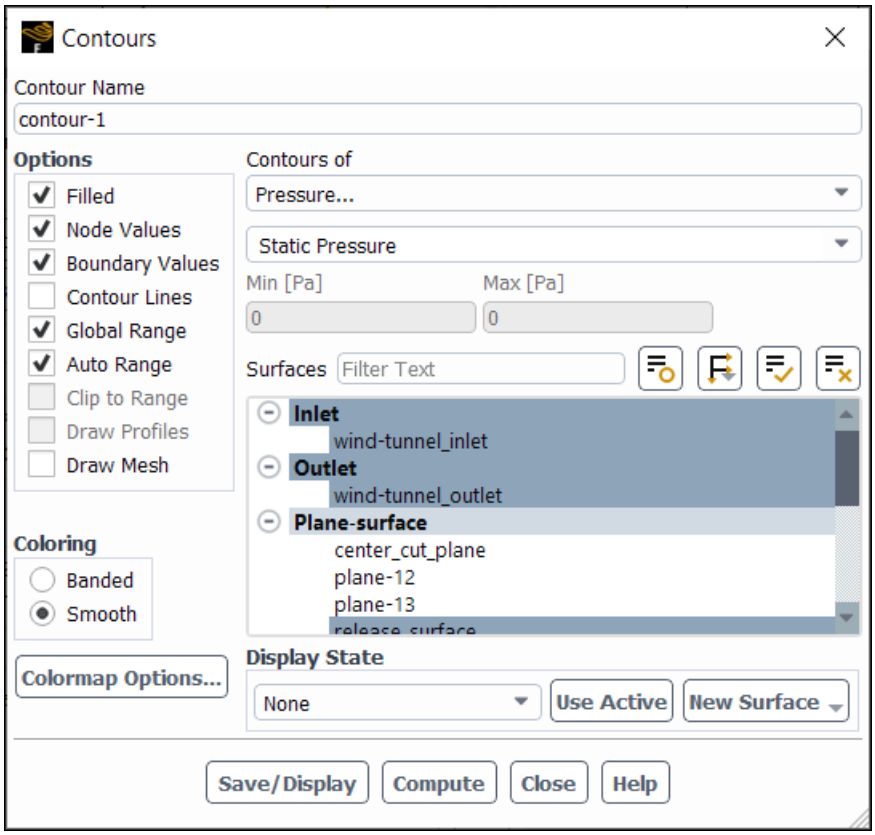
Results → **Graphics** → **Contours** → **New...**

Note:

- The "global"/non-persistent form of graphics objects is hidden by default. If this interrupts your workflow, you can make them available by enabling the **Expose legacy non-persistent graphics** option in the **Graphics** branch of **Preferences** (accessed via **File**>**Preferences...**).
- (When you click **Edit...** instead of **New...**, it opens the "global"/non-persistent version of the **Contours** dialog box. This version of the dialog box does not have a **Name** field and it is not saved with the case file.

  You are encouraged to use the persistent version that is accessed by clicking **New...**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Contour Name

is the name for a contour plot definition. You can specify a name or use the default name **`contour-id`** . This control appears only for contour plot definitions.

Options

contains the check buttons that set various contour display options.

Filled

toggles between filled contours and line contours.

Node Values

toggles between using scalar field values at nodes and at cell centers for computing the contours. When the **Filled** option is off, **Node Values** is always on. See Choosing Node or Cell Values and Node or Boundary Values (p. 3883) and Node Values (p. 4134) for details.

Boundary Values

enabling overwrites the node values (on boundaries) with a simple average of the boundary face values. Refer to Choosing Node or Cell Values and Node or Boundary Values (p. 3883) for more information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Contour Lines

combines filled contours with line contours. This option is only available when both the **Filled** and **Node Values** options are enabled.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Clip to Range

determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See Specifying the Range of Magnitudes Displayed (p. 3880) for details.

Draw Profiles

causes the addition of a profile plot to the contour plot. The Profile Options Dialog Box (p. 5184) is opened when **Draw Profiles** is selected.

Note:

Draw Profiles is only available for the non-persistent/"global" version of the **Contours** dialog box that does not have a **Name** field. This version of the dialog box is opened by:

- Right-clicking **Contours** in the Outline View tree and selecting **Edit...** (located under the **Results** branch).
- Clicking **Contours** and selecting **Edit...** under **Graphics** in the **Results** ribbon tab.

Draw Mesh

toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 4636) is opened when **Draw Mesh** is selected.

Coloring

specifies how the contours appear.

Banded

the contour coloring features distinct color bands corresponding to the colormap.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Smooth

the contours feature a smooth transition between colors.

Colormap Options...

opens the Colormap Dialog Box (p. 5226), allowing you to customize the colormap for this graphics object.

Contours of

contains a list from which you can select the scalar field to be contoured.

Min

shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max

shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Surfaces

contains a list from which you can select the surfaces on which to draw contours. For 2D cases, if no surface is selected, contouring is done on the entire domain. For 3D cases, you must always select at least one surface.

Display State

specifies the display state that is associated with this graphics object.

drop-down list of display states

selectable list of all the existing display states associated with this case.

Use Active

creates a display state that matches the settings of the active graphics window and assigns it to this graphics object (this association is only saved after you click **Save/Display**).

New Surface

is a drop-down list button that contains a list of surface options:

Point

opens the Point Surface Dialog Box (p. 5525).

Line/Rake

opens the Line/Rake Surface Dialog Box (p. 5458).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plane

opens the Plane Surface Dialog Box (p. 5523).

Quadric

opens the Quadric Surface Dialog Box (p. 5527).

Iso-Surface

opens the Iso-Surface Dialog Box (p. 5445).

Iso-Clip

opens the Iso-Clip Dialog Box (p. 5444).

Structural Point

opens the Structural Point Surface Dialog Box (p. 5565).

Display

draws the contours in the active graphics window.

Compute

calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

Save/Display

plots the contour in the active graphics window and saves the contour plot definition. This button appears only for contour plot definitions and replaces the **Display** button.

51.2.18. Convergence Conditions Dialog Box

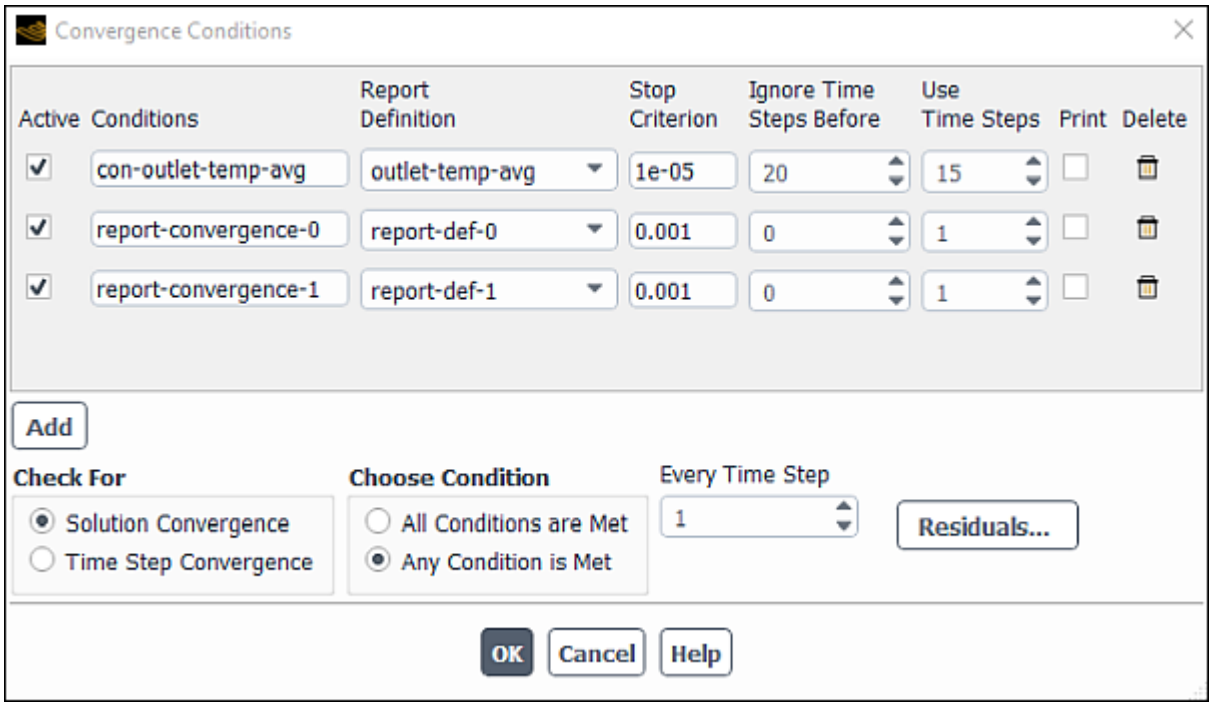
The convergence conditions facility allows you to set convergence conditions on the solution based on the values from report definitions (surface, volume, lift, drag, and so on). See Convergence Conditions (p. 3682) for details on setting up the **Convergence Conditions** dialog box.

Note:

If you are solving a transient case, the **Convergence Conditions** dialog box will relabel some fields since the transient case uses time-steps rather than iterations. These alternate labels are indicated below.

Solution → Reports → Conditions...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Active

check box for deactivating/activating individual convergence conditions.

Conditions

name of the convergence condition.

Report Definition

name of the report definition used in judging convergence.

Stop Criterion

specifies the criterion below which the solution is considered to be converged.

Ignore Iterations Before | Ignore Time Steps Before

ignores the first few iterations/time-steps if you expect the solution to fluctuate initially.

Use Iterations | Use Time Steps

specifies the number of previous iterations/time-steps to be included in the report definition convergence check.

Check For

specify whether Fluent checks for convergence at every time step or every iteration.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Solution Convergence

Fluent checks for solution convergence at every time step.

Time Step Convergence

Fluent checks for solution convergence at every iteration.

Choose Condition

to select the convergence conditions.

All Conditions are Met

The solution is considered to be converged if all of the convergence conditions' criteria are satisfied, including those in the Residual Monitors Dialog Box (p. 5541).

Any Condition is Met

The solution is considered to be converged if any of the convergence conditions' criteria is satisfied, including those in the Residual Monitors Dialog Box (p. 5541).

Every Iteration | Every Time-Step

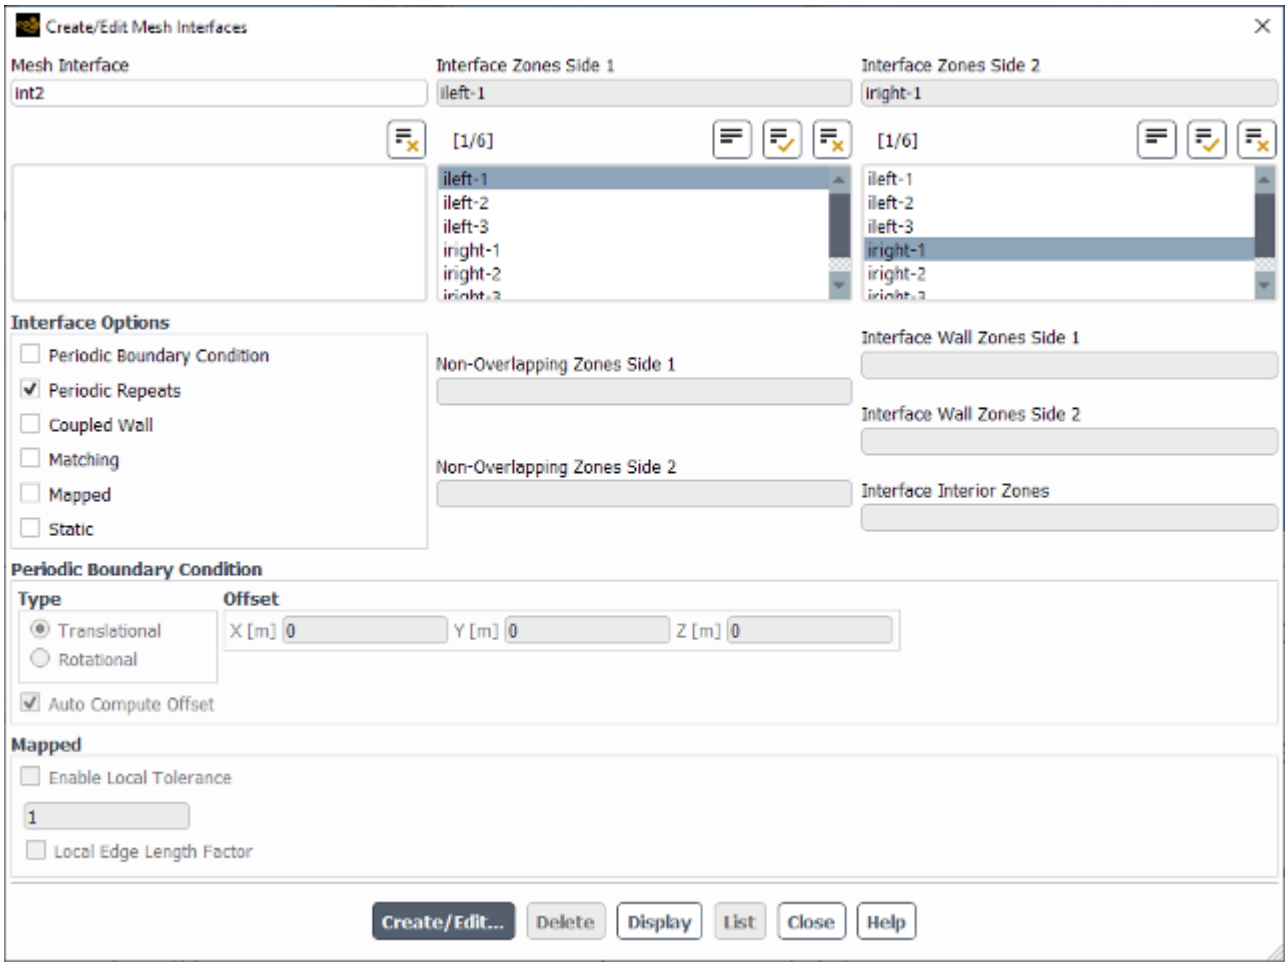
to select how often convergence checks are done.

51.2.19. Create/Edit Mesh Interfaces Dialog Box

The **Create/Edit Mesh Interfaces** dialog box allows you to manually create mesh interfaces for use with sliding meshes (see Using Sliding Meshes (p. 1772)) or multiple reference frames (see Mesh Setup for a Multiple Moving Reference Frame (p. 1753)), or for meshes with non-conformal boundaries (see Non-Conformal Meshes (p. 1149)). This dialog box requires you to decide which interface zones make up both sides of each mesh interface. While it is possible to create every type of many-to-many mesh interface using this dialog box, it is only necessary when you want your interface to use the periodic or periodic repeats option; for all other types it is more convenient to automatically create interfaces using the Mesh Interfaces Dialog Box (p. 5468), especially when you have many interface zones and/or are unfamiliar with their names / locations. For details, see Using a Non-Conformal Mesh in Ansys Fluent (p. 1164).

The **Create/Edit Mesh Interfaces** dialog box is opened by clicking the **Manual Create...** button in the Mesh Interfaces Dialog Box (p. 5468). Note that this button is only available if you have disabled the default one-to-one interface creation method by using the `define/mesh-interfaces/one-to-one-pairing?` text command.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mesh Interface

contains a text entry box in which you can set the name of the mesh interface, and a list from which you can select an existing mesh interface.

Interface Zones Side 1, Interface Zones Side 2

contain selectable lists for the interface zones that make up the mesh interface and informational fields that show the names of the zones you selected in each list. (You cannot edit the top fields; the names in these fields will be the names of the zones you selected in the list below it.)

Interface Options

contains options related to the interface type.

Periodic Boundary Condition

allows you to create a non-conformal periodic boundary condition interface. Note that the **Matching** option is enabled by default with such periodic mesh interfaces.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Periodic Repeats

should be enabled when each of the two cell zones has a single pair of conformal or non-conformal periodics adjacent to the interface. This option is typically used in conjunction with the sliding mesh model, when simulating the interface between a rotor and stator; it allows Ansys Fluent to treat the interface between the sliding and non-sliding zones as periodic where the two zones do not overlap. For details, see The Periodic Repeats Option (p. 1153).

Coupled Wall

allows you to specify that the interface acts as a thermally coupled wall.

Matching

is relevant if only interface internal zones should be created (that is, interior or wall / shadow pairs), since the interface zones on both sides are aligned. With the **Matching** option, even interface zones that are not perfectly aligned are treated as if they are; however, if the discrepancy between the interface zones on both sides exceeds default thresholds, then warning messages will be displayed. Note that the **Matching** option is compatible with the **Periodic Boundary Condition**, **Coupled Wall**, and **Static** options. For more information about the recommended uses of this option, see Matching Option (p. 1156).

Mapped

enables an alternative approach for modeling coupled walls between zones. This approach is more robust than the standard non-conformal interface formulations when the interface zones penetrate each other or have gaps between them. It requires that at least one side of the interface consists of only solid zones.

Note:

The **Mapped** option is not compatible with shell conduction.

Static

reduces the memory usage and processing time (for interface creation and solution), especially when there are many zones on both sides of the interface. This option will only produce correct results if the interface zones do not move or deform relative to each other at the interface, and it is not compatible with the **Periodic Boundary Condition**, **Periodic Repeats**, or **Mapped** options.

Non-Overlapping Zones Side 1, Non-Overlapping Zones Side 2

display the names of any wall boundary zones created by Ansys Fluent during the process of creating the selected mesh interface. If the two interface zones overlap each other completely, then the wall boundaries are created but with zero faces.

Interface Wall Zones Side 1, Interface Wall Zones Side 2

display the names of any wall interface zones created by Ansys Fluent during the process of creating the selected mesh interface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Interface Interior Zones

displays the names of any interface interior zones created by Ansys Fluent during the process of creating the selected mesh interface. This is used for embedded LES, when there is a need to be able to convert an interior zone into a RANS-LES interface.

Periodic Boundary Condition

Type

allows you to select a periodicity that is either **Translational** or **Rotational**.

Offset

is the offset coordinates or angle, depending on whether **Translational** or **Rotational** periodicity is selected. Note that when **Auto Compute Offset** is enabled, the **Offset** fields are not editable.

Auto Compute Offset

will result in Ansys Fluent finding the offset. If this option is disabled, then you will have to provide the offset coordinates or angle in the required fields, depending on whether **Translational** or **Rotational** periodicity is selected.

Mapped

Enable Local Tolerance

(when enabled) allows you to overwrite any value specified in the **Tolerance** group box in the Mapped Interface Options Dialog Box (p. 5464), and is used on the selected interface only.

Local Edge Length Factor

(when enabled) allows you to specify the multiplier that Fluent uses with the smallest edge length of the interface zones to calculate the tolerance for mapping. Disabling **Local Edge Length Factor** allows you to specify an absolute value for the tolerance.

Create/Edit...

performs one of the following:

- If you have entered a new **Mesh Interface** name and selected unassigned zones from the **Interface Zones Side 1** and **Interface Zones Side 2** selection lists, a new mesh interface is created.
- If you have made a selection from the **Mesh Interface** list, the Edit Mesh Interfaces Dialog Box (p. 5398) will open so that you can revise the settings of existing mesh interfaces.

Delete

deletes the mesh interface selected under **Mesh Interface**.

Display

allows you to display interface zones or mesh interfaces in the graphics window. Note that you can only select and display an interface zone from **Interface Zones Side 1** or **Interface Zones**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

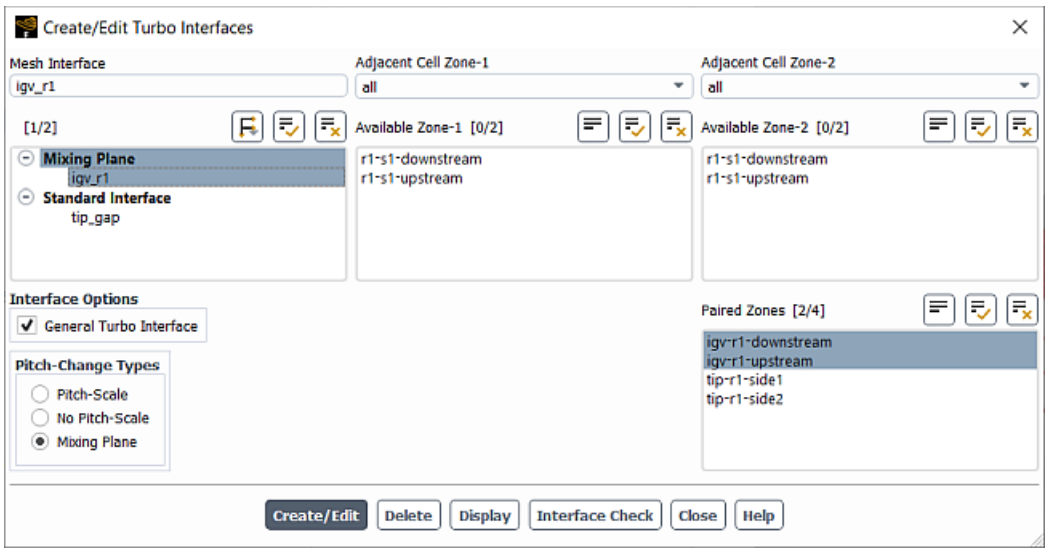
Side 2 if it is not yet assigned to an existing mesh interface. After a **Mesh Interface** is created, you can select the appropriate mesh interface and click the **Display** button to display all of the zones under **Interface Zones Side 1** and **Interface Zones Side 2**.

List

prints information about the selected **Mesh Interface** in the console. When you click this button, Ansys Fluent will list the two interface boundaries and (if you have initialized the solution) all new zones that were created (that is, wall and/or interior zones).

51.2.20. Create/Edit Turbo Interfaces Dialog Box

The **Create/Edit Turbo Interfaces** dialog box allows you to manually create many-to-many mesh interfaces to connect blades to one another. This dialog box requires you to decide which interface zones make up both sides of each turbo interface and specify the blade row interaction model. For details, see Creating and Editing General Turbo Interfaces (p. 1930).



Controls

Mesh Interface

contains a text entry box in which you can set the name of the turbo interface, and a list from which you can select an existing mesh interface.

Interface Zones Side 1, Interface Zones Side 2

contain selectable lists for the interface zones that make up the turbo interface and informational fields that show the names of the zones you selected in each list. (You cannot edit the top fields; the names in these fields will be the names of the zones you selected in the list below it.)

Interface Options

contains options related to the interface type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Periodic Boundary Condition

allows you to create a non-conformal periodic boundary condition interface. Note that the **Matching** option is enabled by default with such periodic mesh interfaces; for details about the **Matching** option, see Matching Option (p. 1156).

General Turbo Interface

(only available when the Turbo Model is enabled) connects two turbo zones. This option is typically used in conjunction with the sliding mesh model, when simulating the interface between a rotor and stator. These models permit for a pitch-change between the modeled blade rows.

Pitch-Change Types

Pitch-Scale

stretches or compresses the flow profiles between the cell zones to maintain the interaction between blade row passages. See Blade Row Interaction Modeling (p. 1924) for details.

No Pitch-Scale

maintains the blade row interaction between blade row passages by creating virtual copies of the smaller pitch blade passage. See Blade Row Interaction Modeling (p. 1924) for details.

Mixing Plane

uses a pitchwise averaging procedure to mix out the flow variation between the blade rows. See Blade Row Interaction Modeling (p. 1924) for details.

Create/Edit...

performs one of the following:

- If you have entered a new **Mesh Interface** name and selected unassigned zones from the **Interface Zones Side 1** and **Interface Zones Side 2** selection lists, a new mesh interface is created.
- If you have made a selection from the **Mesh Interface** list, the Edit Mesh Interfaces Dialog Box (p. 5398) will open so that you can revise the settings of existing mesh interfaces.

Delete

deletes the mesh interface selected under **Mesh Interface**.

Display

allows you to display interface zones or mesh interfaces in the graphics window. Note that you can only select and display an interface zone from **Interface Zones Side 1** or **Interface Zones Side 2** if it is not yet assigned to an existing mesh interface. After a **Mesh Interface** is created, you can select the appropriate mesh interface and click the **Display** button to display all of the zones under **Interface Zones Side 1** and **Interface Zones Side 2**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

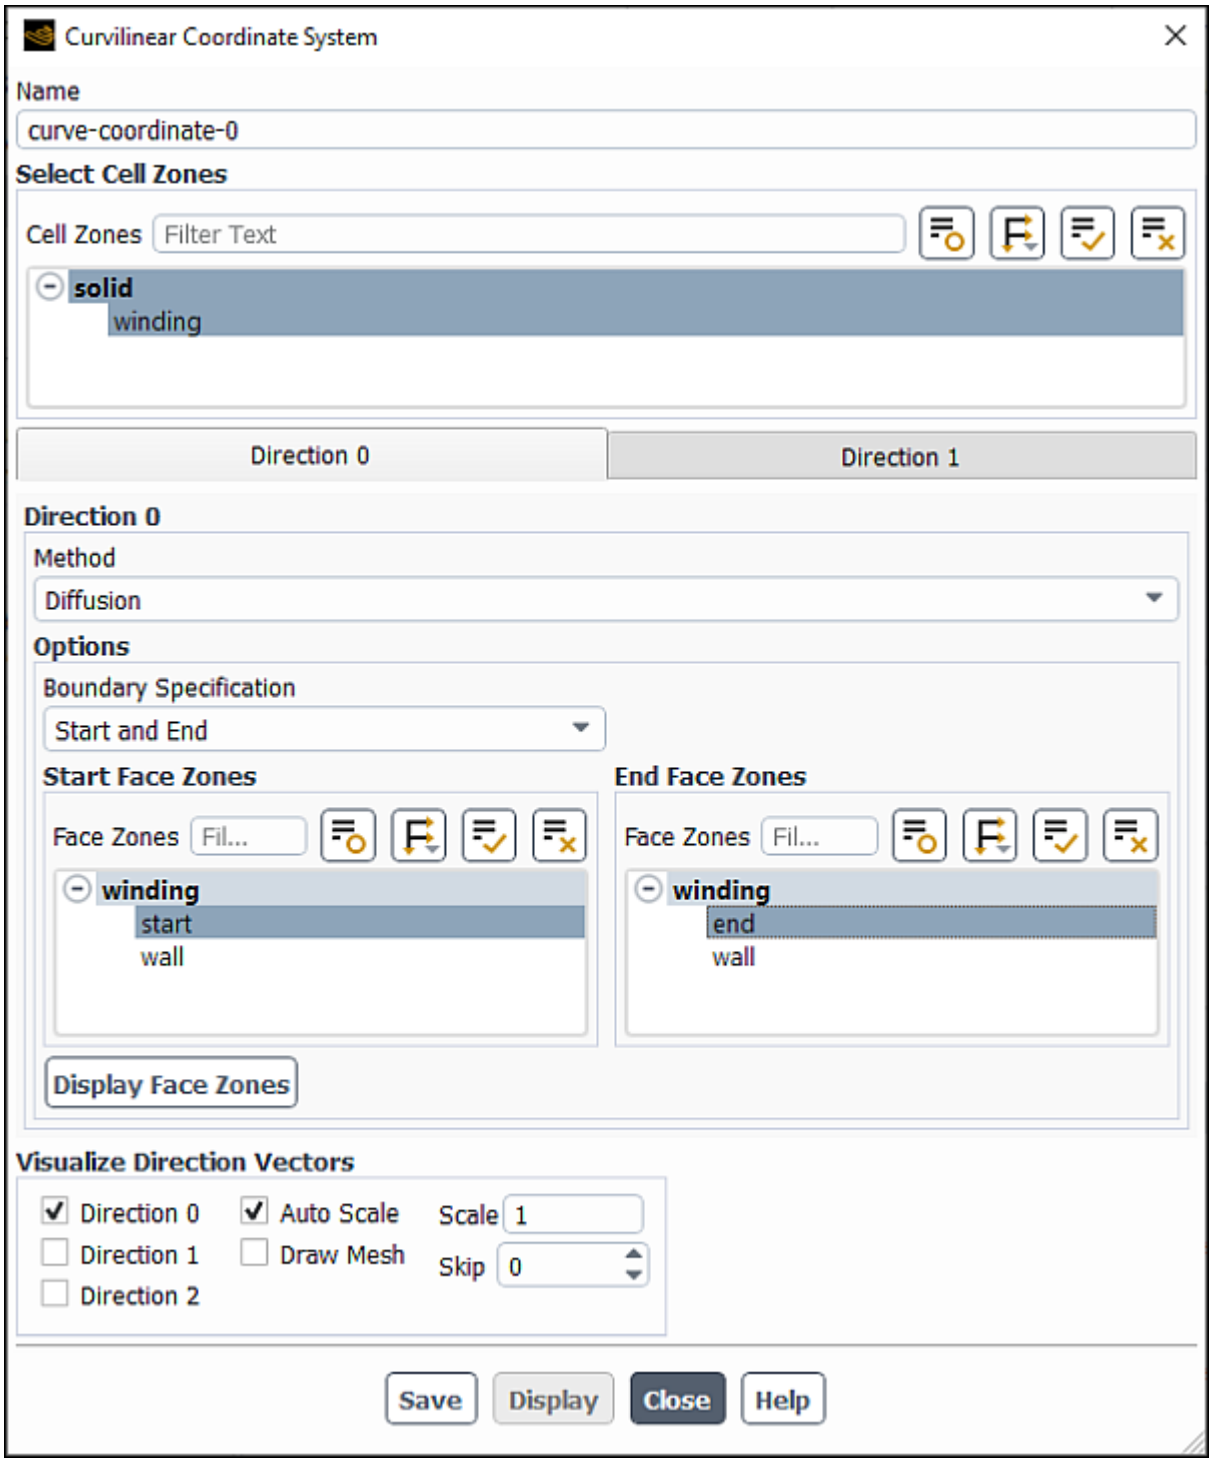
List

prints information about the selected **Mesh Interface** in the console. When you click this button, Ansys Fluent will list the two interface boundaries and (if you have initialized the solution) all new zones that were created (that is, wall and/or interior zones).

51.2.21. Curvilinear Coordinate System Dialog Box

The **Curvilinear Coordinate System** dialog box allows you to create local coordinate systems that follow the geometry of the model. Refer to Curvilinear Coordinate Systems (p. 1143) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the curvilinear coordinate system.

Cell Zones

specifies the cell zone whose geometry will be used to create the curvilinear coordinate system.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction 0 (1)

tabs to specify Direction 0 and 1 of the curvilinear coordinate system. Note that Direction 2 is calculated from the cross product of Direction 0 and 1.

Method

There are 2 options for specifying a direction.

- **Diffusion** - utilizes geometry to specify direction as determined by **Boundary Specification**.

  Start and End

  specifies the direction using a **Start Face Zone** and an **End Face Zone**.

  Jump

  for closed loop geometries, specifies the direction from **Interior Zones** (utilizing a coupled wall as a cross section, which is then split into start and end faces).

- **Base Vector** - specifies the direction using an **X**, **Y**, **Z** vector

Display Face Zones

displays currently selected face zones.

Visualize Direction Vectors

options to visualize the curvilinear coordinate system.

Direction 0

selects Direction 0 to display in the graphics viewer.

Direction 1

selects Direction 1 to display in the graphics viewer.

Direction 2

selects Direction 2 to display in the graphics viewer.

Auto Scale

scales the vectors to an appropriate size.

Draw Mesh

opens the Mesh Display dialog box.

Scale

specifies the size of the vectors for display.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Skip

Thins the number of vectors displayed to improve visibility.

Save

Saves the curvilinear coordinate system.

Display

Displays the curvilinear coordinate system according the settings under **Visualize Direction Vectors**.

51.2.22. Custom Field Function Calculator Dialog Box

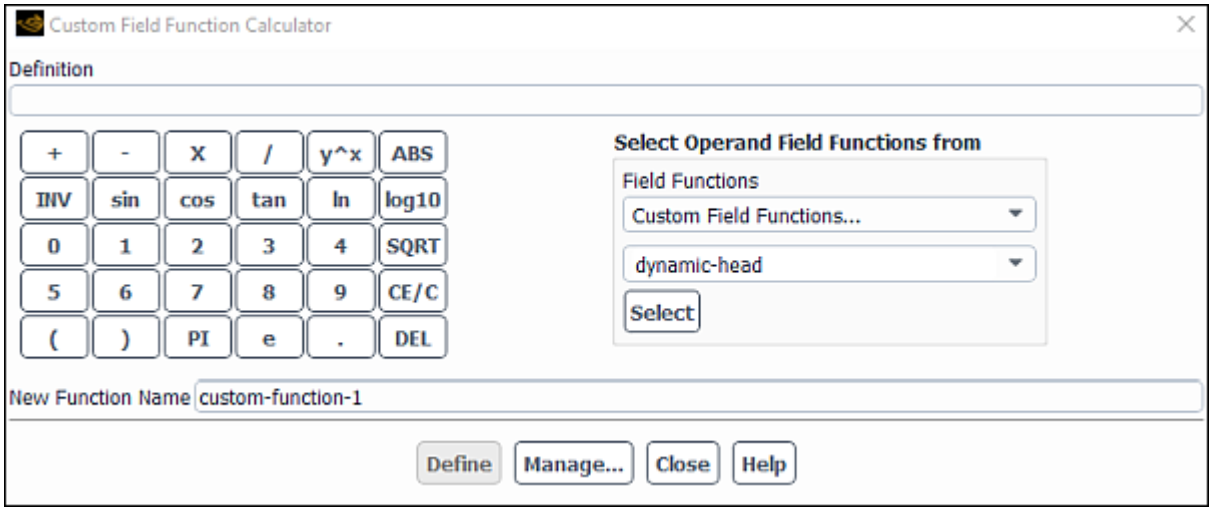
The **Custom Field Function Calculator** dialog box allows you to define custom field functions based on existing functions, using simple calculator operators. Any functions that you define will be added to the list of default flow variables and other field functions provided by Ansys Fluent.

Important:

Recall that you must enter all constants in the function definition in SI units.

See Creating a Custom Field Function (p. 4252) for details about the items below.

User Defined → Field Functions → Custom...



Controls

Definition

displays the function that you are currently defining. As you select each item from the **Field Functions** list or the calculator keypad, it will appear in the **Definition** text entry box. You *cannot* edit the contents of this box directly; if you want to delete part of a function, use the **Delete** button on the keypad.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(Calculator Buttons)

are buttons that perform calculator operations. When you select a calculator button (by clicking on it), the appropriate symbol will appear in the **Definition** text entry box.

Select Operand Field Functions from

contains the available field functions and the means for selecting them.

Field Functions

contains a list from which you can select a variable to be used in the definition of a new function.

Select

enters the variable that is currently selected in the **Field Functions** list in the **Definition** field.

New Function Name

specifies the name of the function you are defining. Should you decide to change the function name after you have defined the function, you can do so in the Field Function Definitions Dialog Box (p. 5420), which you can open by clicking on the **Manage...** button.

Define

creates the function and adds it to the list of **Custom Field Functions** within the drop-down list of available field functions. The **Define** button is grayed out after you create a new function or if the **Definition** field is empty.

Manage...

opens the Field Function Definitions Dialog Box (p. 5420), which enables you to check, rename, save, load, and delete custom field functions.

51.2.23. Custom Laws Dialog Box

The **Custom Laws** dialog box is used to incorporate user-defined functions (see the separate Fluent Customization Manual for details) in place of the default physical laws used in the heat/mass transfer calculations.

The **Custom Laws** dialog box is opened from the Set Injection Properties Dialog Box (p. 5550).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

First Law, Second Law, Third Law,...

contain drop-down lists in which you can choose a user-defined particle law to replace the standard law.

Switching

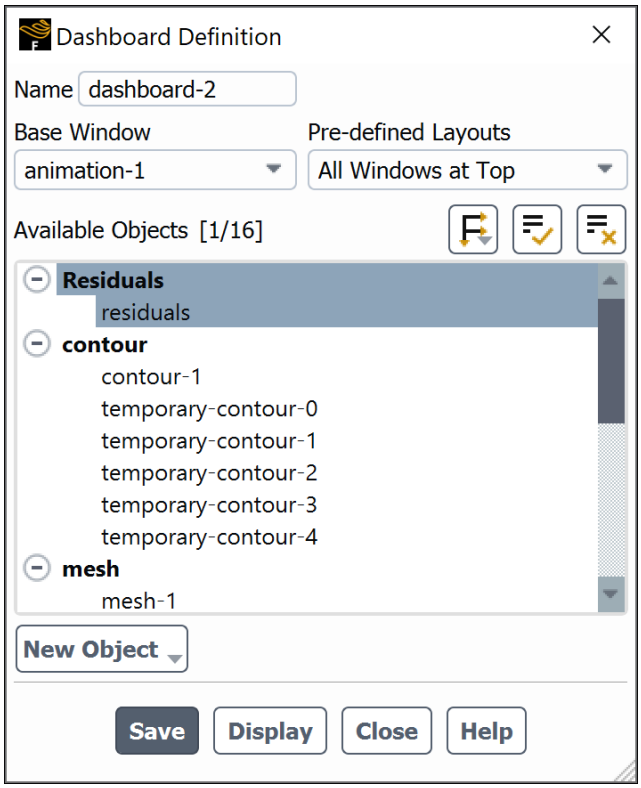
contains a drop-down list in which you can select a user-defined function that customizes the way Ansys Fluent switches between particle laws.

51.2.24. Dashboard Definition Dialog Box

The **Dashboard Definition** dialog box allows you create custom embedded window dashboards that are saved with the case file and added to the Outline View tree. See Geometry-Based Adaption with the Hanging Node Method (p. 3790) for details.

Results → Graphics → Dashboard...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

is the name for a dashboard definition. You can specify a name or use the default name **dashboard-*id***.

Base Window

specifies which window will be the background, upon which all other graphics and plot objects are embedded. *It is possible to not specify a background window*.

Pre-defined Layouts

controls how the embedded windows are arranged when they are displayed first displayed. You can manually move and resize the windows once they are displayed.

Available Objects

lists the available graphics and plot objects that can be included in the dashboard.

New Object

drop-down list allowing you to create additional graphics objects that can be included in the dashboard.

Save

saves the dashboard to the case file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

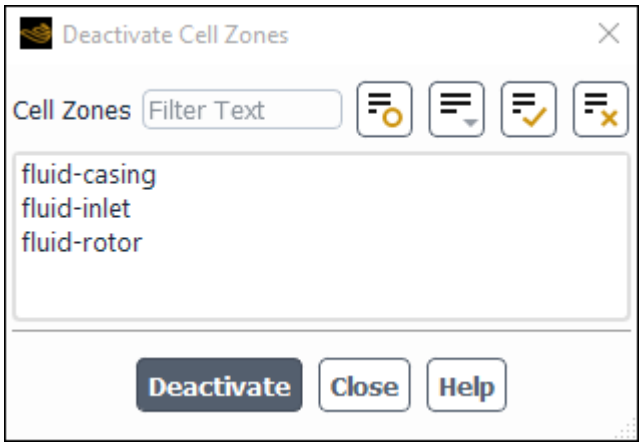
Display

saves the dashboard and displays it in the graphics window.

51.2.25. Deactivate Cell Zones Dialog Box

The **Deactivate Cell Zones** dialog box allows you to deactivate a single cell zone or multiple zones. See Deactivating Zones (p. 1254) for details.

Domain → Zones → Deactivate...



Controls

Cell Zones

contains a list of cell zones from which you can select the zone to be deactivated.

Deactivate

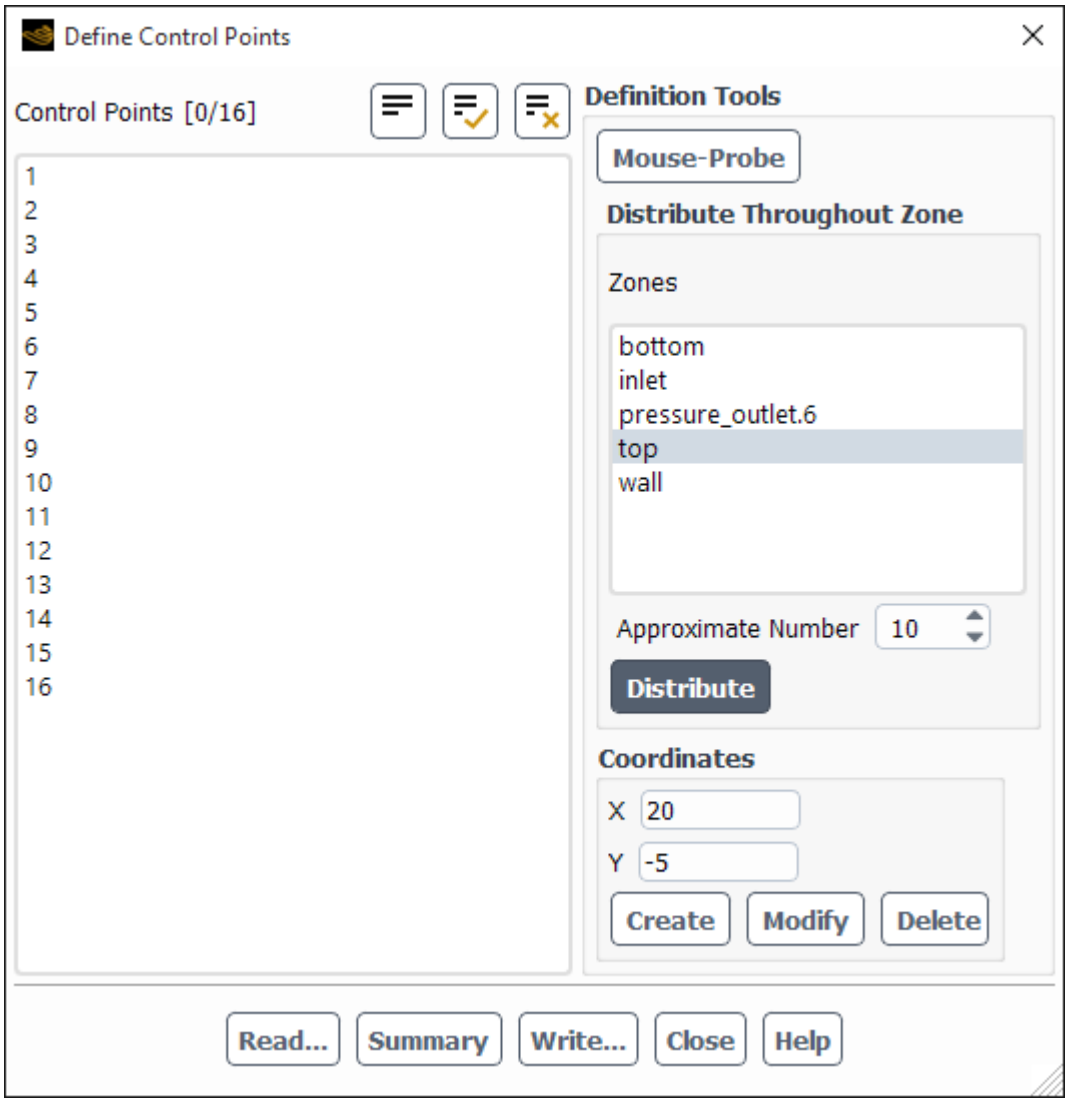
deactivates the selected cell zones.

51.2.26. Define Control Points Dialog Box

The **Define Control Points** dialog box allows you to create, modify, and delete control points for the mesh morpher/optimizer when the unstructured control point distribution is selected. See Using the Mesh Morpher/Optimizer (p. 4568) for details about using this dialog box.

The **Define Control Points** dialog box is opened from the Mesh Morpher/Optimizer Dialog Box (p. 5471).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Control Points

lists the control points you have created and allows you to modify and delete them.

Definition Tools

provides tools for defining the control points.

Mouse-Probe

allows you to create control points by probing (using the right mouse button, by default) in the graphics window.

Distribute Throughout Zone

allows you to quickly create a number of control points and distribute them on mesh nodes throughout a specific boundary zone.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zones

allows you to select the boundary zone throughout which you want to distribute control points.

Approximate Number

allows you to specify the approximate number of control points you want to distribute throughout a zone. Note that due to the method by which the control points are distributed, the actual number may exceed the value you enter.

Distribute

creates a number of control points on mesh nodes throughout the specified zone (within the bounding box) with a distribution that is based on the distribution of the cell faces in that zone.

Coordinates

allows you to view and modify the coordinates of control points, as well as to create new control points and to delete existing control points.

X, Y, Z

displays the coordinates of the selected **Control Point**, and allows you to define new ones and edit existing ones.

Create

creates a new control point at the currently displayed **X**, **Y**, and **Z** coordinates.

Modify

revises the **X**, **Y**, and **Z** coordinates of the selected **Control Point**.

Delete

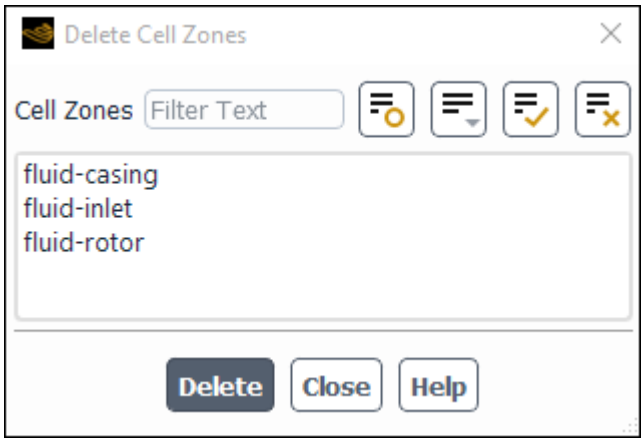
deletes the selected **Control Point**.

51.2.27. Delete Cell Zones Dialog Box

The **Delete Cell Zones** dialog box allows you to delete a single cell zone or multiple zones. See Deleting Zones (p. 1254) for details.

Domain → Zones → Delete...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Cell Zones

contains a list of cell zones from which you can select the zone to be deleted.

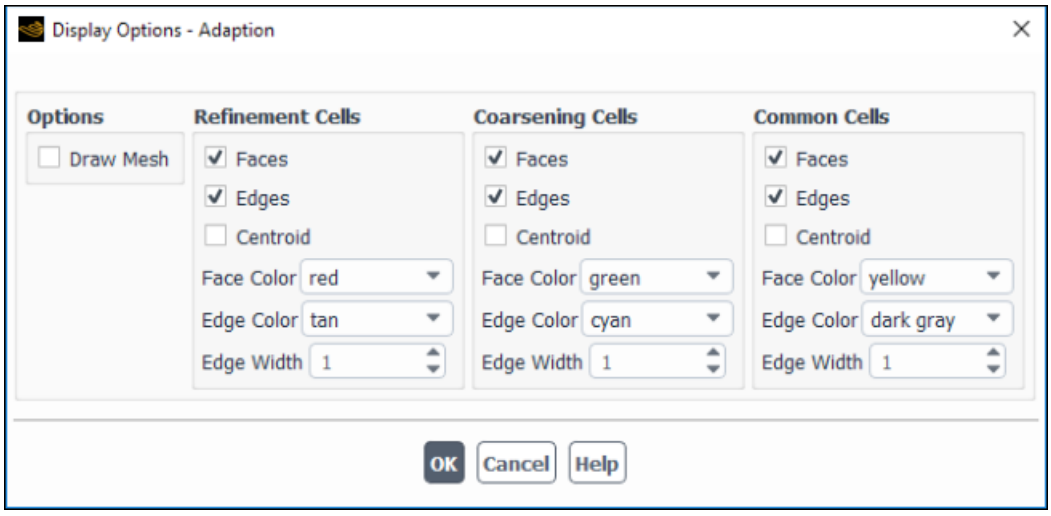
Delete

deletes the selected cell zones.

51.2.28. Display Options - Adaption Dialog Box

The **Display Options - Adaption** dialog box allows you to customize how the cells marked for adaption are displayed.

This dialog box is accessed by clicking **Display Options** in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).



Controls

Options

contains check boxes that controls the drawing of the mesh.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Draw Mesh

toggles the ability to draw the mesh with the adaption display. This command opens the Mesh Display Dialog Box (p. 4636), which allows you to select the desired surface or zone meshes to be displayed with the markings.

Refinement Cells

contains options related to the display of cells marked for refinement.

Faces

controls whether cell faces are displayed on the cells marked for refinement.

Edges

controls whether cell edges are displayed on the cells marked for refinement.

Centroid

controls whether the cell centroid is displayed on the cells marked for refinement.

Face Color

controls the color of the cell faces on the cells marked for refinement.

Edge Color

controls the color of the cell edges on the cells marked for refinement.

Edge Width

controls the thickness of the cell edges on the cells marked for refinement.

Coarsening Cells

contains options related to the display of cells marked for coarsening.

Faces

controls whether cell faces are displayed on the cells marked for coarsening.

Edges

controls whether cell edges are displayed on the cells marked for coarsening.

Centroid

controls whether the cell centroid is displayed on the cells marked for coarsening.

Face Color

controls the color of the cell faces on the cells marked for coarsening.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edge Color

controls the color of the cell edges on the cells marked for coarsening.

Edge Width

controls the thickness of the cell edges on the cells marked for coarsening.

Common Cells

contains options related to the display of cells marked for both refinement and coarsening.

Faces

controls whether cell faces are displayed on the cells marked for both refinement and coarsening.

Edges

controls whether cell edges are displayed on the cells marked for both refinement and coarsening.

Centroid

controls whether the cell centroid is displayed on the cells marked for both refinement and coarsening.

Face Color

controls the color of the cell faces on the cells marked for both refinement and coarsening.

Edge Color

controls the color of the cell edges on the cells marked for both refinement and coarsening.

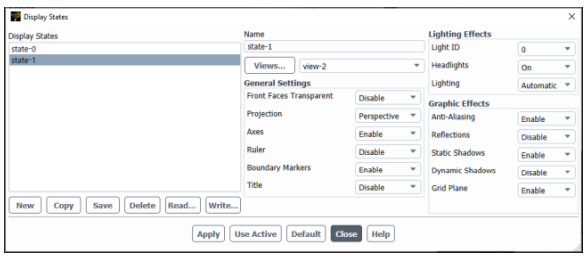
Edge Width

controls the thickness of the cell edges on the cells marked for both refinement and coarsening.

51.2.29. Display States Dialog Box

This dialog box is accessed by clicking **Display States...** in the **View** ribbon tab.

View → Display → Display States...



Controls

Display States

single selection listing of all defined display states.

New

create a new display state with the same settings as the active graphics window (or the last active user window if the current active window is displaying a 2D plot).

Copy

create a new display state the copies the properties of the selected display state.

Save

save the properties of the selected display state.

Delete

delete the selected state.

Read...

read in display states from a file.

Write...

write display states to a file.

Name

name of the selected display state.

Views...

opens the Views Dialog Box (p. 5218).

Views Drop-down List

list of views that can be associated with this display state.

General Settings

lists general graphics window settings.

Front Faces Transparency

controls whether the front faces are transparent.

Projection

specifies whether the display is in a perspective or orthographic view.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axes

controls whether or not the axes triad is displayed.

Ruler

controls whether or not the ruler is displayed.

Boundary Markers

controls whether or not boundary markers are displayed. *Note that boundary markers are only displayed on mesh, not other graphics objects like contours or vectors.*

Title

controls whether or not the titles bar is displayed.

Edge Color

controls the color of the cell edges on the cells marked for refinement.

Lighting Effects

lists lighting settings.

Light ID

controls which light ID is saved. If more than one light ID is active when you click **Use Active** from a graphics object dialog box, this option is set to **Don't Save**.

Headlights

controls whether the headlight is on or off.

Lighting

specifies the lighting method that is used for the display.

Graphic Effects

lists the graphics effects.

Anti-Aliasing

controls whether or not lines and text are smooth.

Reflections

controls whether or not a reflection of the model is shown (with the axis of reflection being controlled in Preferences).

Static Shadows

controls whether or not static shadows are displayed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dynamic Shadows

controls whether or not dynamic shadows are displayed. *These shadows move as you rotate your model and are computationally expensive to render.*

Grid Plane

controls whether or not the grid plane is shown (with the axis for the grid being controlled in Preferences).

Apply

save the settings of the selected display state and apply these settings to the active graphics window display.

Use Active

update the currently-selected display state to inherit the display state settings of the active graphics window. *This button is not available if the active graphics window is displaying a 2D plot.*

Default

resets the selected display state to match the default settings.

Table 51.1: Default Display State Settings

Setting	State
View	isometric
Front Faces Transparent	Disable
Projection	Perspective
Axes	Enable
Ruler	Disable
Boundary Markers	Enable
Title	Disable
Light ID	0
Headlights	On
Lighting	Automatic
Anti-Aliasing	Enable
Reflections	Enable
Static Shadows	Enable
Dynamic Shadows	Disable

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

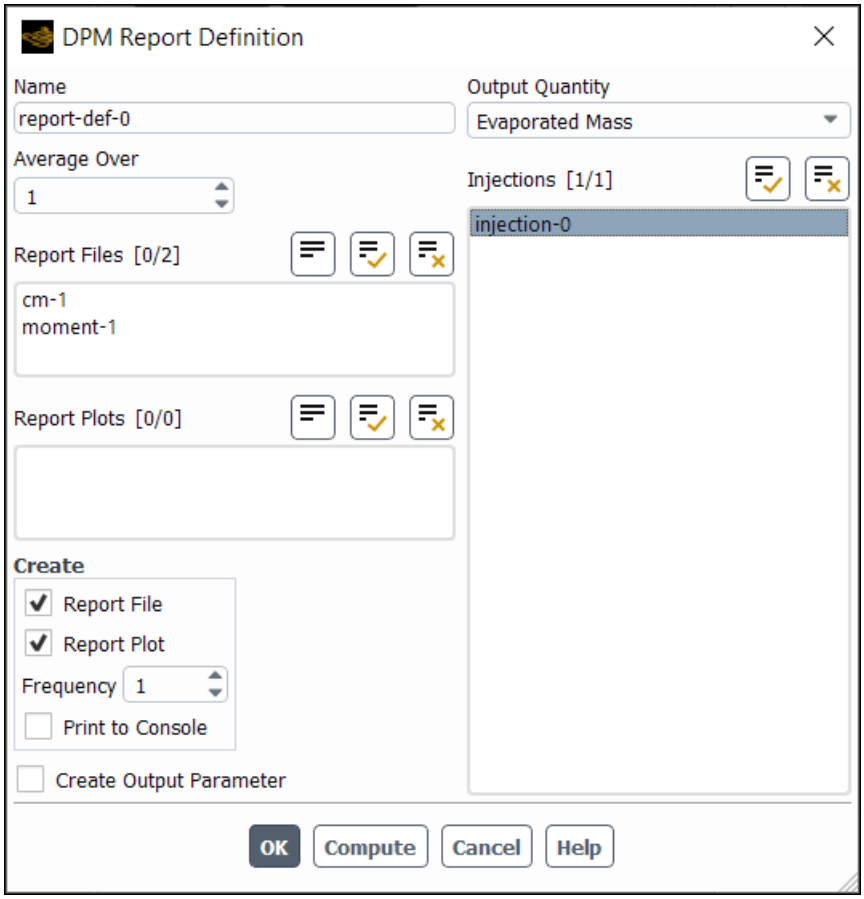
Setting	State
Grid Plane	Enable

Note:

The default graphics effects settings are dependent on the available graphics driver. If no modern graphics driver is available, graphics effects will be disabled.

51.2.30. DPM Report Definition Dialog Box

Solution → Reports → Definitions → New → DPM Report



Controls

Name

specifies the name of the report definition.

Average Over

(optional) To have Fluent calculate a running average for the **DPM Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

options you can choose when creating your report.

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Output Quantity

quantities that can be applied to the output parameter.

Injected Mass

(unsteady particle tracking only) reports the total DPM mass injected into the domain.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mass in Domain

(unsteady particle tracking only) reports the total DPM mass present in the domain.

Mass in Fluid

(unsteady particle tracking only) reports all DPM mass currently residing as free-stream particles in the domain. This option is available only with the **wall-film** DPM boundary condition.

Mass in Film

(unsteady particle tracking only) reports all DPM mass currently residing in Lagrangian wall-film. This option is available only with the **wall-film** DPM boundary condition.

Escaped Mass

reports the DPM mass that has left the domain through a certain boundary or boundaries.

Evaporated Mass

reports the total evaporated DPM mass for the selected injection(s). The quantity accounts for fully evaporated particles as well as all mass that has evaporated from any other particles. For unsteady tracking, this includes particles that are still present in the domain.

Penetration Length

(unsteady particle tracking only) reports the total penetration length in meters.

Injections

lists the injections that you can select for discrete phase reporting. For the **Escaped Mass** output quantity, this item is available only if you have enabled the `report/dpm-zone-summaries-per-injection` text command. Note that for unsteady particle tracking, if you want to report the mass of escaped particles per injection, this text command must be enabled before any particles are injected into the domain.

Boundaries

contains a selectable list of valid boundary zones for escaped mass reporting.

Show Mass Flow/Change Rate

(unsteady particle tracking only) if enabled, specifies that the mass flow rate will be reported (default). Otherwise the total mass will be reported. This item is not available for the **Penetration Length** report.

Particles Mass Fraction

the mass fraction expected between the injection nozzle and the penetration length. This item is available only for the **Penetration Length** reports.

User-Specified Origin and Direction

once enabled, it allows you to specify the **Origin** and **Direction** of the selected injection(s). This item is available only for the **Penetration Length** reports.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OK

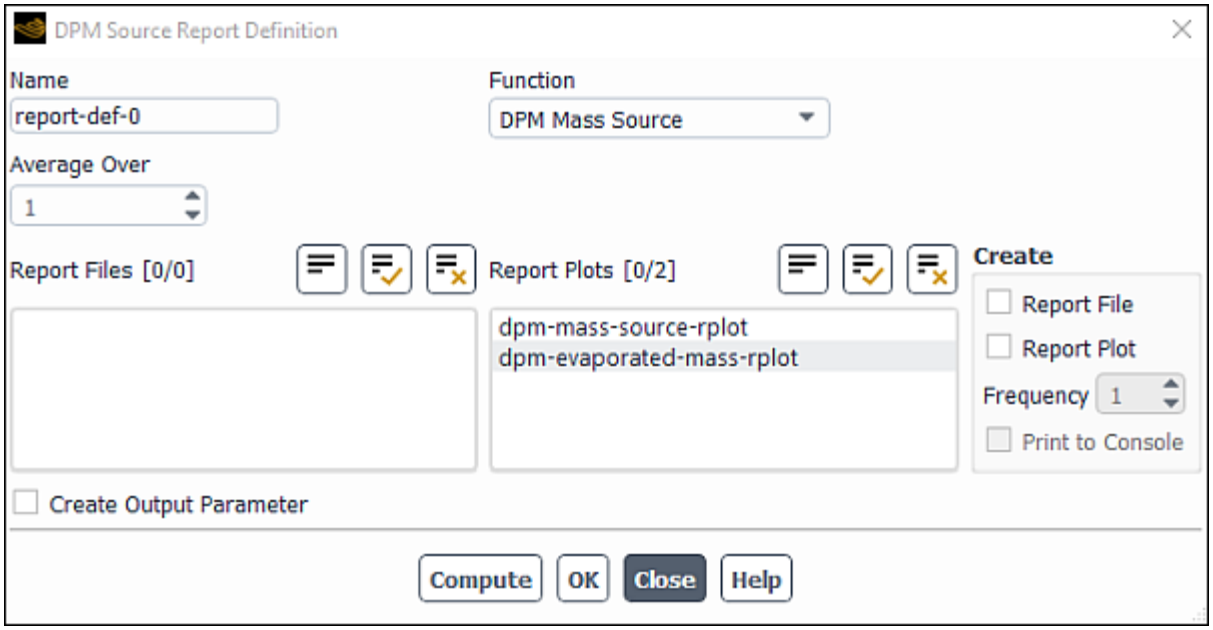
creates the report definition.

Compute

computes the value of the report definition and prints to the console.

51.2.31. DPM Source Report Definition Dialog Box

Solution → Reports → Definitions → New → Flux Report → DPM Mass Source | DPM Enthalpy Source | DPM Sensible Enthapy Source



Controls

Name

specifies the name of the report definition.

Function

functions available for the source report definition.

DPM Mass Source

reports the mass contributions from the particle injections.

DPM Enthalpy Source

reports the heat contributions from the particle injections.

DPM Sensible Enthalpy Source

reports the sensible heat contributions from the particle injections.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Average Over

(optional) To have Fluent calculate a running average for the **DPM Source Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Create

options you can choose while generating a report.

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Compute

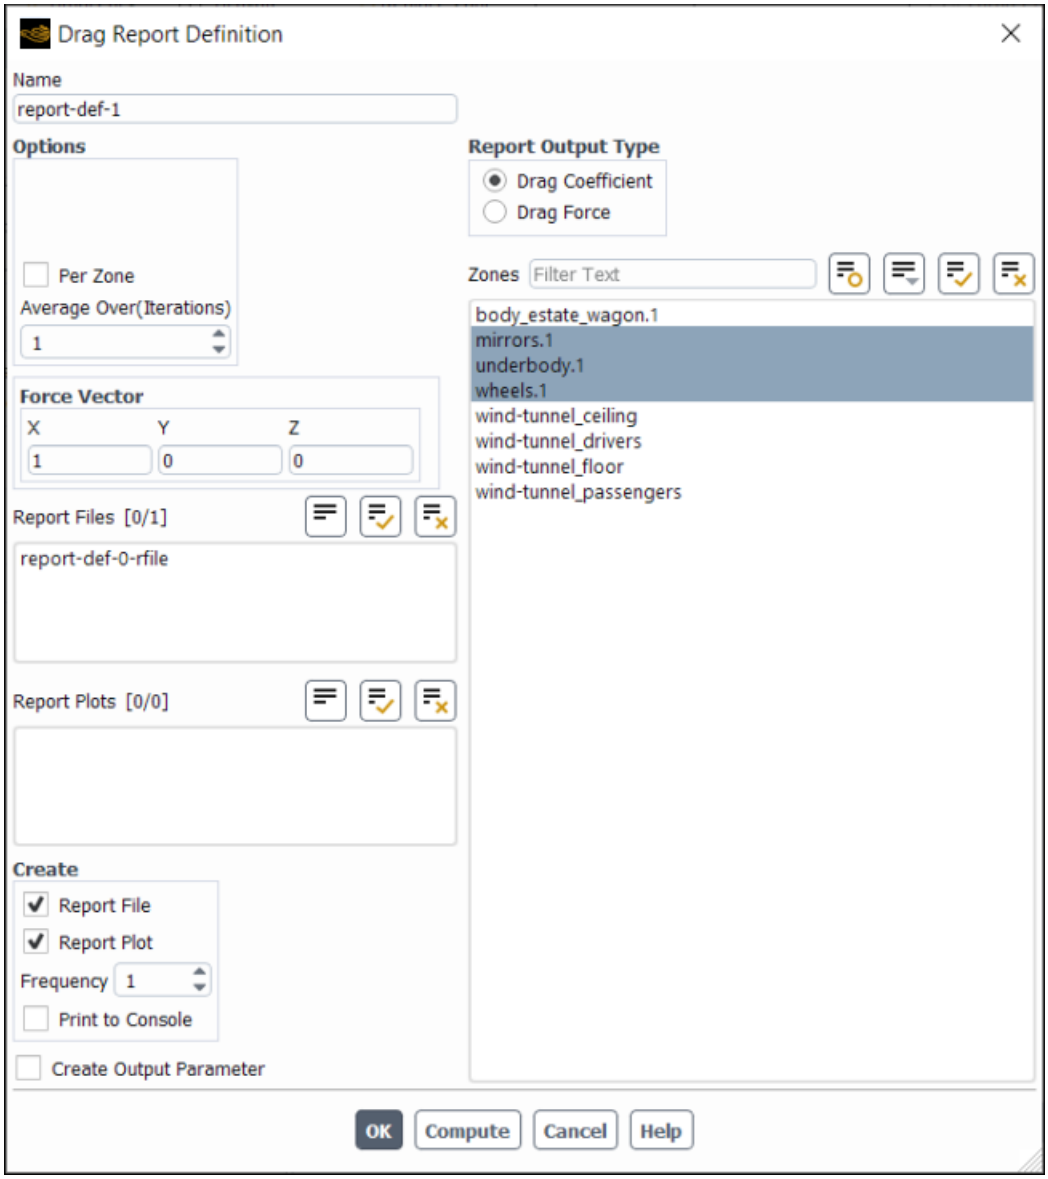
computes the value of the report definition and prints to the console.

OK

creates the report definition.

51.2.32. Drag Report Definition Dialog Box

Solution → Reports → Definitions → New → Force Report → Drag...



Controls

Name

specifies the name of the report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

options you can choose for the drag report.

Per Zone

specifies whether or not the drag for multiple walls zones should be monitored on each wall zone separately. When this option is turned off (the default), Fluent computes and monitors the total drag for all of the selected walls zones combined together.

Average Over (Time-Steps), Average Over (Iterations)

(optional) To have Fluent calculate a running average for the **Drag Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Force Vector

contains the components of the force vector.

X,Y,Z

are the components of the force vector along which the forces will be computed.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

options you can choose while generating a report.

Report File

creates a new report file that includes this report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Report Output Type

options you can choose relevant to report output.

Drag Coefficient

specifies the report definition as a unitless quantity.

Drag Force

specifies that the report definition has units of force.

Zones

lists the zones you can select for drag coefficient or drag force computation.

OK

creates the report definition.

Compute

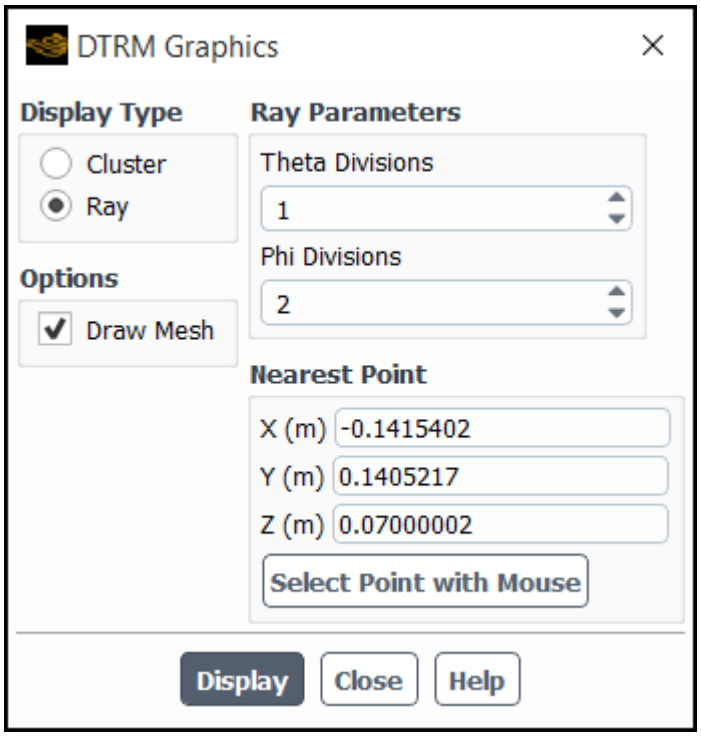
computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.33. DTRM Graphics Dialog Box

The **DTRM Graphics** dialog box allows you to display rays and clusters used by the DTRM. See Displaying Rays and Clusters for the DTRM (p. 2209) for details.

Results → **Model Specific** → **DTRM Graphics...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Display Type

contains options for the different items you can display.

Cluster

specifies the display of clusters.

Ray

specifies the display of rays.

Options

contains check buttons that control display options.

Draw Mesh

toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 4636) is opened when **Draw Mesh** is selected.

Cluster Type

specifies whether **Surface** clusters or **Volume** clusters are to be displayed. This section of the dialog box appears when **Cluster** is selected as the **Display Type**.

Cluster Selection

contains options for cluster displays. This section of the dialog box appears when **Cluster** is selected as the **Display Type**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Display All Clusters

enables the display of all surface or volume clusters in the domain.

Ray Parameters

contains controls for displaying rays. This section of the dialog box appears when **Ray** is selected as the **Display Type**.

Theta Divisions, Phi Divisions

control the number of rays being traced. (See Controlling the Rays (p. 2161).)

Nearest Point

specifies a point (**X,Y,Z**) near the cluster to be displayed (or the cluster from which the rays should start).

The **Nearest Point** controls are not available when **Display All Clusters** is selected under **Cluster Selection**.

Select Point With Mouse

is an alternative method for specifying the **Nearest Point** using your mouse, by clicking the button.

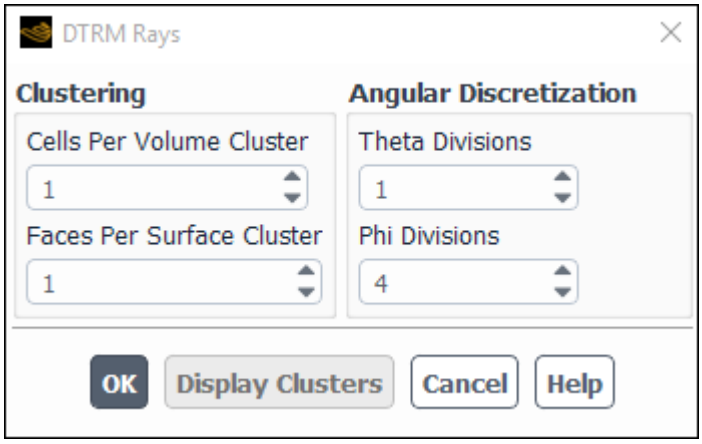
Display

displays the specified cluster(s) or rays.

51.2.34. DTRM Rays Dialog Box

The **DTRM Rays** dialog box allows you to define the rays used by the discrete transfer radiation model (DTRM). It opens automatically when you click **OK** after selecting the **Discrete Transfer** model in the Radiation Model Dialog Box (p. 4684). See Setting Up the DTRM (p. 2159) for details about the items below.

Physics → Model Specific → DTRM Rays...



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Clustering

contains parameters for the clusters (see Clustering in the Theory Guide).

Cells Per Volume Cluster, Faces Per Surface Cluster

control the number of radiating surfaces and absorbing cells. (See the explanation in Controlling the Clusters (p. 2161).)

Angular Discretization

contains parameters for the ray traces (see Ray Tracing in the Theory Guide).

Theta Divisions, Phi Divisions

control the number of rays being traced. (Guidelines are provided in Controlling the Rays (p. 2161).)

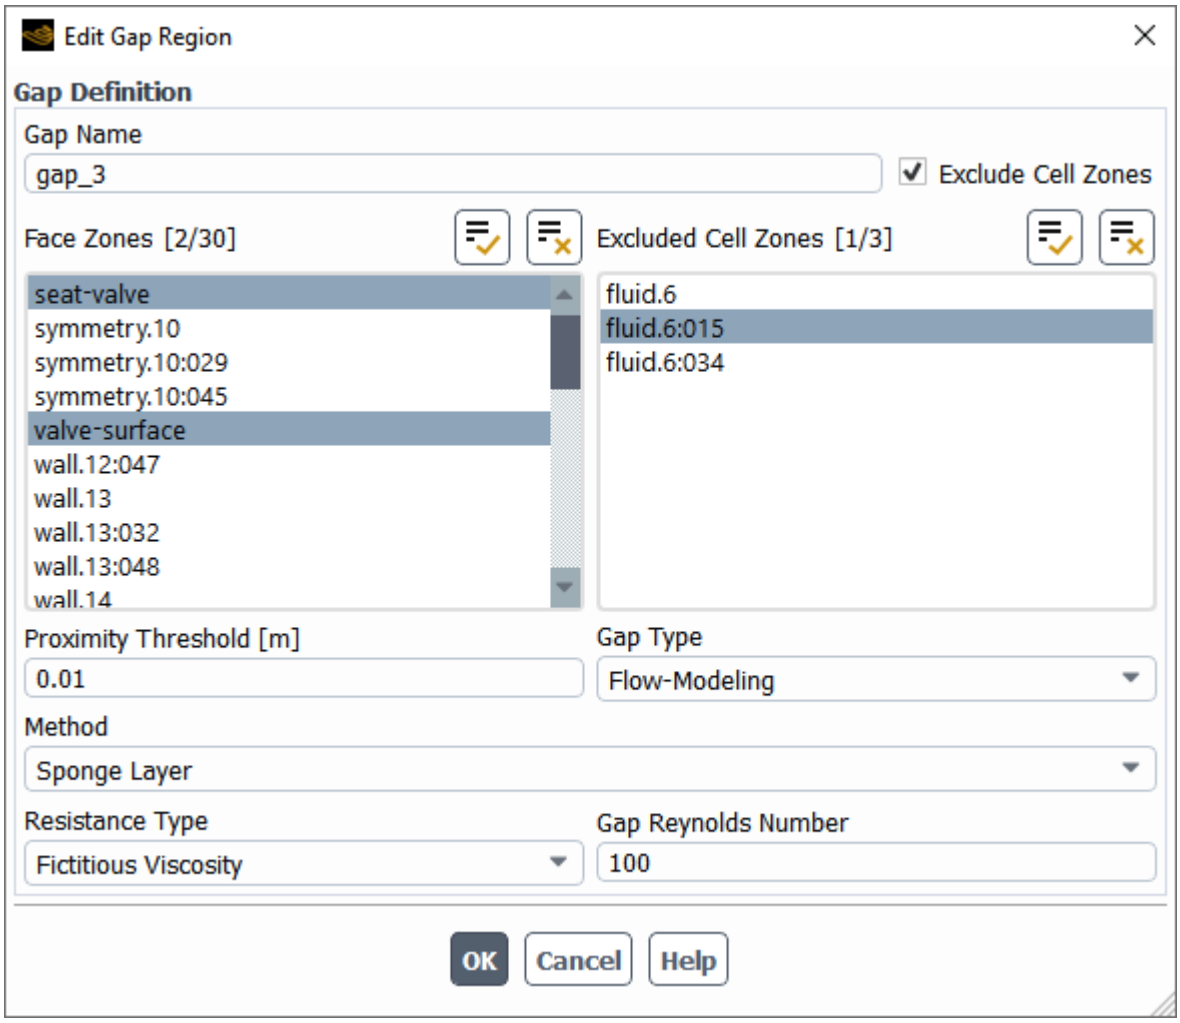
Display Clusters

generates a graphical display of the clusters in the domain. (This item is available only after you have created or read a ray file.)

51.2.35. Edit Gap Region Dialog Box

The **Edit Gap Region** dialog box allows you to edit an existing gap region as part of a gap model simulation. It is opened by making a selection from the **Gap Regions** list in the Gap Model Dialog Box (p. 5428) and clicking **Edit...**. See also Controlling Flow in Narrow Gaps for Valves and Pumps (p. 1211).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Gap Definition

contains input controls for editing an existing gap region.

Gap Name

specifies the name of the gap region. It cannot consist solely of numbers.

Face Zones

allows you to select the two or more face zones that constitute the gap region.

Proximity Threshold

defines the maximum distance between the face zones when flow blockage / deceleration occurs in the gap.

Gap Type

defines the type of the gap region. A **Flow-Blocking** type completely blocks the flow in the gap region, as a numerical zero-mass-flux boundary condition is applied at the boundary faces

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

of the marked region so that the marked cells no longer participate in the solution. A **Flow-Modeling** type decelerates the flow in the cells of the marked region by manipulating the viscosity or source terms.

Method

defines the method used to scale the viscosity or to define source terms in the gap region. The **Sponge Layer** method specifies that the viscosity inside the gap regions is scaled based on the specified **Gap Reynolds Number**. The **User-Defined Source** method specifies the use of a compiled user-defined function (UDF) to define the source terms for the momentum and energy equations in the gap region. This drop-down list is only available when **Flow-Modeling** is selected for the **Gap Type**.

Resistance Type

specifies how the viscosity is scaled in the gap region. The **Fictitious Viscosity** approach scales the laminar viscosity inside the gap region during discretization of the viscous forces for the momentum equation; thus, its impact is explicitly seen in the velocity and pressure computation, and it has an implicit effect on the other solution fields through the changes in the velocity and pressure field. The **Real Viscosity** approach changes the actual laminar viscosity inside the gap region based on your specified **Gap Reynolds Number**; therefore, the effect of modeling will be seen not only in flow equation but also in other equations. This drop-down list is only available when **Flow-Modeling** is selected for the **Gap Type** and **Sponge Layer** is selected for the **Method**.

Gap Reynolds Number

defines the intended Reynolds number in the gap region, and thus determines the level of sealing. A lower **Gap Reynolds Number** results in better sealing. It can be estimated according to Equation 6.4 (p. 1215). This drop-down list is only available when **Flow-Modeling** is selected for the **Gap Type** and **Sponge Layer** is selected for the **Method**.

Gap Source Terms

selects a compiled user-defined function (UDF) that specifies the source terms for the momentum and energy equations in the gap region using the `DEFINE_GAP_MODEL_SOURCE` macro. This drop-down list is only available when **Flow-Modeling** is selected for the **Gap Type** and **User-Defined Source** is selected for the **Method**.

Exclude Cell Zones

enables the ability to specify that cells in particular cell zones are not marked for flow blockage / deceleration as part of the gap region, in order to have greater control over the shape of the gap region.

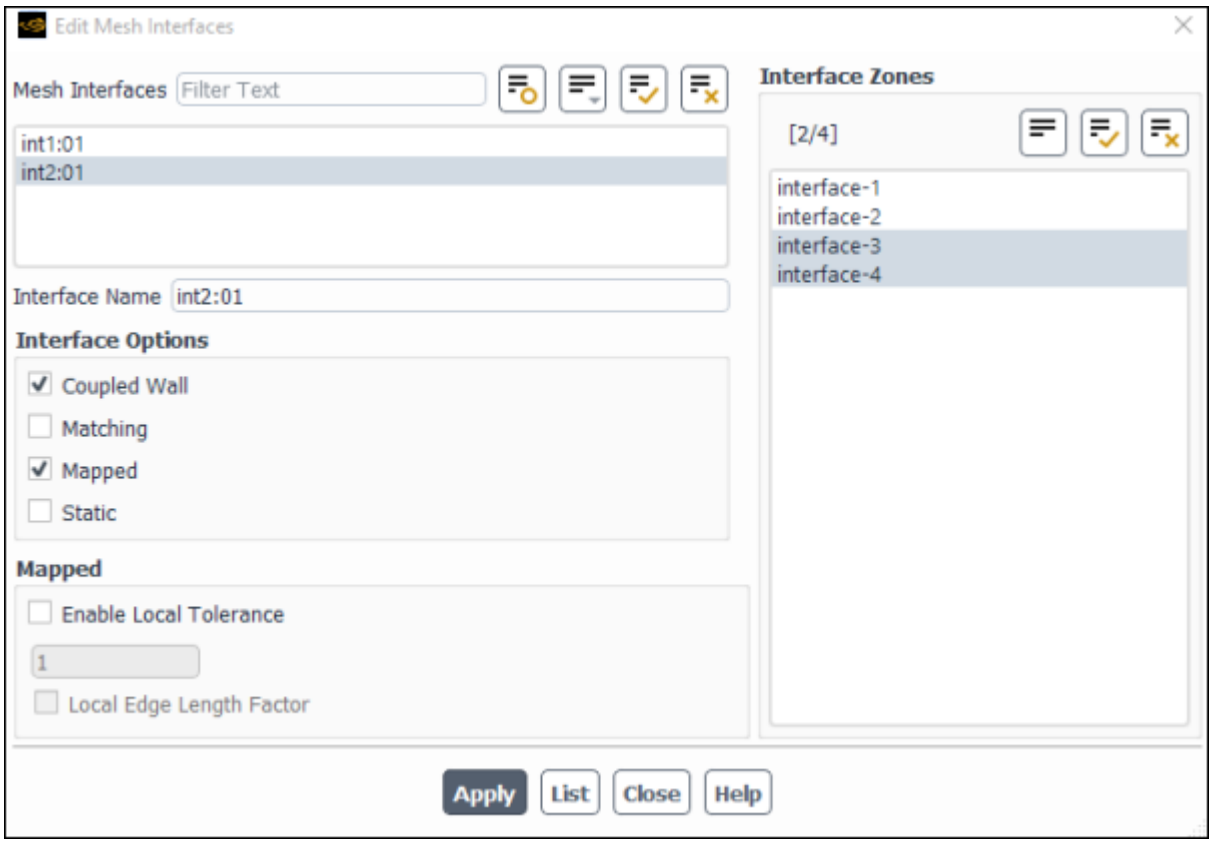
Excluded Cell Zones

selects the cell zones in which cells are not marked for flow blockage / deceleration as part of the gap region.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.36. Edit Mesh Interfaces Dialog Box

The **Edit Mesh Interfaces** dialog box allows you to edit existing many-to-many mesh interfaces. It is opened by making a selection from the **Mesh Interfaces** list in the Mesh Interfaces Dialog Box (p. 5468) and clicking **Edit...**. See also Using a Non-Conformal Mesh in Ansys Fluent (p. 1164).



Controls

Mesh Interfaces

allows you to select the mesh interfaces you would like to edit. Note that you can click the button to group the interfaces in the list by their currently enabled interface option(s), which allows you to select / deselect all those of a particular type by simply clicking the top-level branch.

Interface Name

edits the name of the mesh interface. This is only available when a single interface is selected.

Interface Options

contains options related to the interface type. These options can be applied when a single or multiple interfaces are selected.

Periodic Boundary Condition

allows you to create a non-conformal periodic boundary condition interface.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Periodic Repeats

should be enabled when each of the two cell zones has a single pair of conformal or non-conformal periodics adjacent to the interface. This option is typically used in conjunction with the sliding mesh model, when simulating the interface between a rotor and stator; it allows Ansys Fluent to treat the interface between the sliding and non-sliding zones as periodic where the two zones do not overlap. For details, see The Periodic Repeats Option (p. 1153).

Coupled Wall

allows you to specify that the interface acts as a thermally coupled wall.

Matching

is relevant if only interface internal zones should be created (that is, interior or wall / shadow pairs), since the interface zones on both sides are aligned. With the **Matching** option, even interface zones that are not perfectly aligned are treated as if they are; however, if the discrepancy between the interface zones on both sides exceeds default thresholds, then warning messages will be displayed. Note that the **Matching** option is compatible with the **Periodic Boundary Condition**, **Coupled Wall**, and **Static** options. For more information about the recommended uses of this option, see Matching Option (p. 1156).

Mapped

enables an alternative approach for modeling coupled walls between zones. This approach is more robust than the standard non-conformal interface formulations when the interface zones penetrate each other or have gaps between them. It requires that at least one side of the interface consists of only solid zones.

Note:

The **Mapped** option is not compatible with shell conduction.

Static

reduces the memory usage and processing time (for interface creation and solution), especially when there are many zones on both sides of the interface. This option will only produce correct results if the interface zones do not move or deform relative to each other at the interface, and it is not compatible with the **Periodic Boundary Condition**, **Periodic Repeats**, or **Mapped** options.

Periodic Boundary Conditions

Type

allows you to select a periodicity that is either **Translational** or **Rotational**.

Offset

is the offset coordinates or angle, depending on whether **Translational** or **Rotational** periodicity is selected. Note that when **Auto Compute Offset** is enabled, the **Offset** fields are not editable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Auto Compute Offset

will result in Ansys Fluent finding the offset. If this option is disabled, then you will have to provide the offset coordinates or angle in the required fields, depending on whether **Translational** or **Rotational** periodicity is selected.

Mapped

Enable Local Tolerance

(when enabled) allows you to overwrite any value specified in the **Tolerance** group box in the Mapped Interface Options Dialog Box (p. 5464), and is applied to the selected interface only.

Local Edge Length Factor

(when enabled) allows you to specify the multiplier that Fluent uses with the smallest edge length of the interface zones to calculate the tolerance for mapping. Disabling **Local Edge Length Factor** allows you to specify an absolute value for the tolerance.

Interface Zones

highlights the list of interface zones that make up the selected mesh interface and allows you to edit the list (provided that the zones you select are unassigned and located appropriately). This functionality is only available when a single interface is selected.

List

prints information in the console about the first mesh interface you selected. When you click this button, Ansys Fluent will list the interface boundaries and (if you have initialized the solution) all new zones that were created (that is, wall and interior zones).

Apply

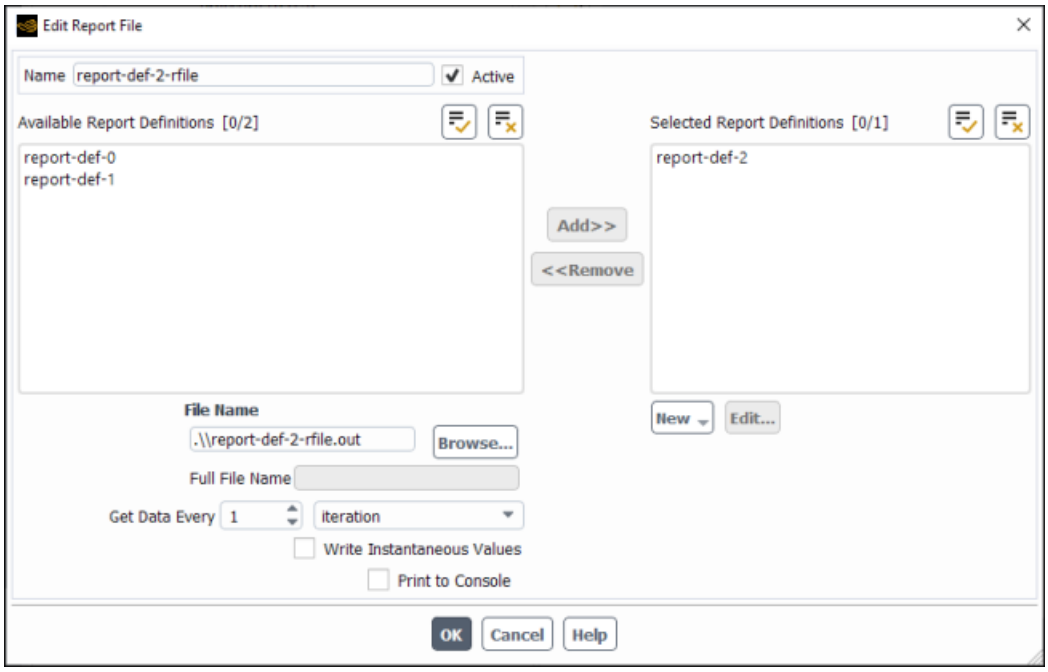
saves the revised settings for the selected mesh interfaces.

51.2.37. Edit Report File Dialog Box

Solution → **Reports** → **File...**

Select a report file in the **Report File Definition** dialog box and click **Edit...** to open the **Edit Report File** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

editable field displaying the name of the report file.

Active

check box (enabled by default) that determines if the file is written during the solution calculation.

Available Report Definitions

lists all of the existing report definitions not currently part of this report file.

Add>>

moves the selected report definition(s) to the **Selected Report Definitions** list.

<<Remove

moves the selected report definition(s) to the **Available Report Definitions** list.

File Name

allows you to specify the name used when the file is saved.

Browse...

opens the **Select File** dialog box, allowing you to specify the location where the report file will be saved.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Full File Name

displays the name and location of the report file once it has been saved. *You can use the keyboard arrow keys to scroll within this field (<, >).*

Get Data Every

indicates the frequency that the report definition data is written to the file. The default value of 1 allows you to write to the file at every iteration or time-step. If you select flow-time, then you must specify the frequency for writing the file in units of time. Time-step and flow-time are only a valid choices when you are calculating unsteady flow.

Print to Console

indicates whether or not the contents of the report file are printed to the console at the frequency specified in the **Get Data Every** field.

Selected Report Definitions

lists all of the existing report definitions currently included in this report file.

New

drop-down list allowing you to create new report definitions (surface, volume, force, flux, mesh, aeromechanics, dpm, expression, and user-defined).

Edit...

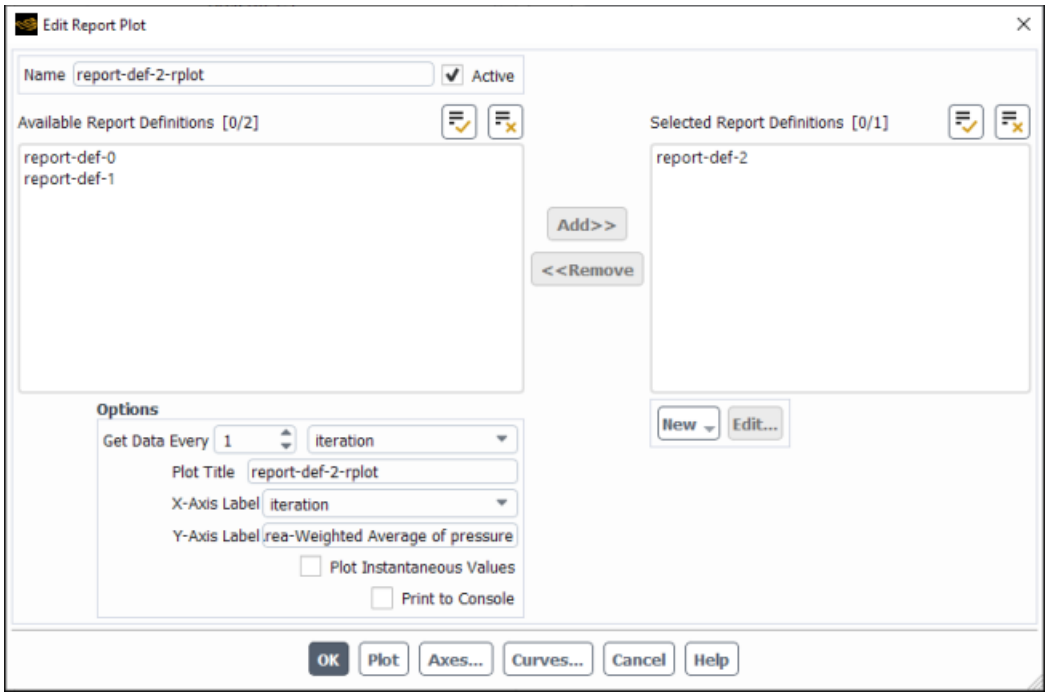
allows you to modify the highlighted report definition in the **Selected Report Definition** list.

51.2.38. Edit Report Plot Dialog Box

Solution → Reports → Plot...

Select a report plot in the **Report Plot Definition** dialog box and click **Edit...** to open the **Edit Report Plot** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

editable field displaying the name of the report plot.

Active

check box (enabled by default) that determines if the plot is plotted during the solution calculation.

Available Report Definitions

lists all of the existing report definitions not currently part of this report plot.

Add>>

moves the selected report definition(s) to the **Selected Report Definitions** list.

<<Remove

moves the selected report definition(s) to the **Available Report Definitions** list.

Options

Get Data Every

indicates the frequency that the report definition data is plotted. The default value of 1 allows you to write to the file at every iteration or time-step. If you select flow-time, then you must specify the frequency for plotting the data in units of time. Time-step and flow-time are only a valid choices when you are calculating unsteady flow.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot Title

provide a title for the plot.

X-Axis Label

choose whether the X-axis is flow-time or time-step.

Y-Axis Label

enter a label for the Y-axis.

Print to Console

indicates whether or not the contents of the report plot are printed to the console at the frequency specified in the **Get Data Every** field.

Selected Report Definitions

lists all of the existing report definitions currently included in this report plot.

New

drop-down list allowing you to create new report definitions (surface, volume, force, flux, mesh, aeromechanics, dpm, expression, and user-defined).

Edit...

allows you to modify the highlighted report definition in the **Selected Report Definition** list.

Curves...

opens the Curves Dialog Box (p. 5262).

Axes...

opens the Axes Dialog Box (p. 5259).

51.2.39. Execute on Demand Dialog Box

The **Execute on Demand** dialog box allows you to run a specified user-defined function immediately. See the separate Fluent Customization Manual for details.

User Defined → User Defined → Execute on Demand...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Execute on Demand

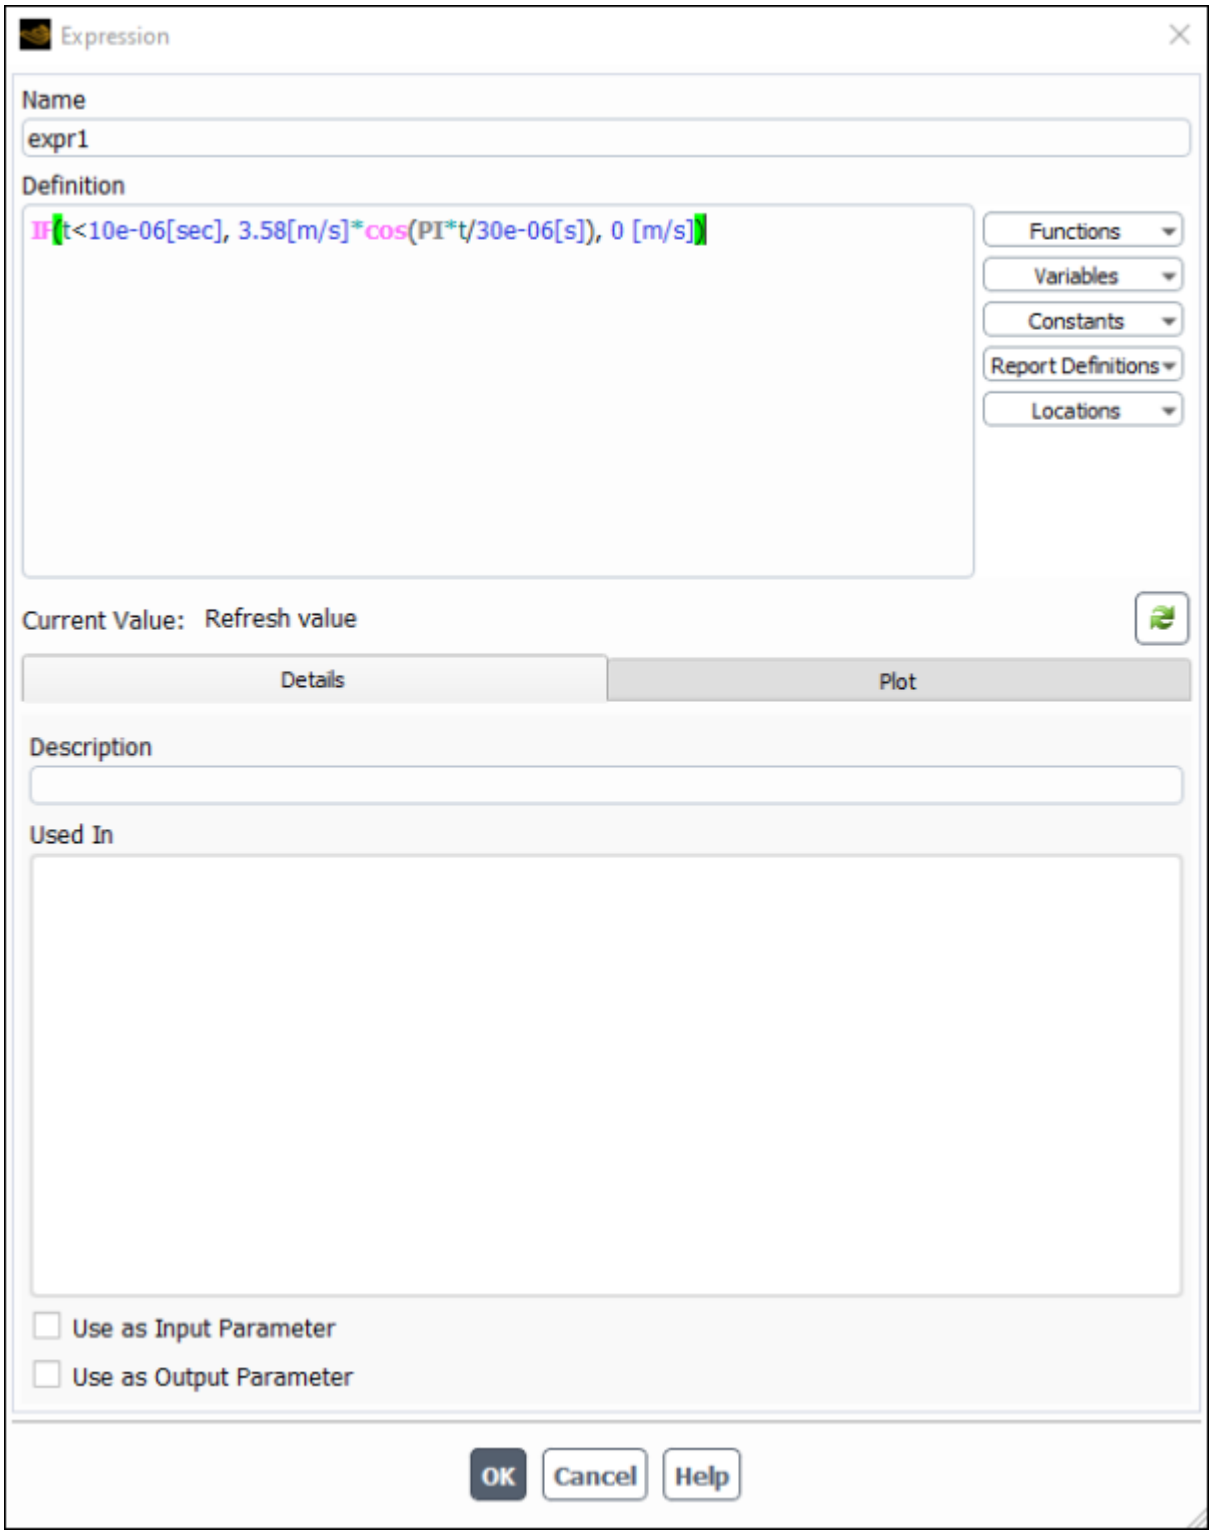
selects the user-defined function to be run.

Execute

runs the selected function.

51.2.40. Expression Dialog Box

Setup → Named Expressions New...



Controls

Name

an editable field allowing you to name the expression. *The **Name** field is not editable when the expression is in use.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Definition

displays the formula of the expression as you create it.

Current Value

Displays the current value of the expression.

Refresh Current Value

Evaluates the expression and updates the **Current Value** field.

Details

This tab contains the optional description of the expression, as well as where the expression is used, and the options to set the expression as an input or output parameter.

Description

(Optional) allows you to provide more of a description of this expression beyond the name.

Used In

lists the locations where the expression is used.

Use as Input Parameter

allows you to define the expression as an input parameter.

Use as Output Parameter

allows you to define the expression as an output parameter.

Plot

This tab allows you to plot your expression to visualize and confirm its behavior.

Primary Independent Variable

allows you to select which variable is the independent variable.

Count

allows you to specify the number of plot points.

Min

sets the minimum value for the independent variable.

Max

sets the maximum value for the independent variable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Secondary Independent Variable

allows you to select the secondary independent variable.

Curves

allows you to specify the number of lines or curves to include in the plot.

Min

sets the minimum value for the secondary independent variable.

Max

sets the maximum value for the secondary independent variable.

Copy to Clipboard

copies the current plot onto your clipboard.

Reset Zoom

resets to the default zoom. *You can click and drag in the plot to change the zoom level.*

Drop-downs

The items in these drop-downs may be used in creating named expressions.

Functions

lists the available functions (conditional, mathematical, and so on) that are available for constructing your expression.

Variables

lists all of the supported variables.

Cell Registers

lists the defined cell registers.

Constants

lists the available pre-defined constants.

Expressions

lists the defined expressions.

Report Definitions

lists the defined report definitions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Locations

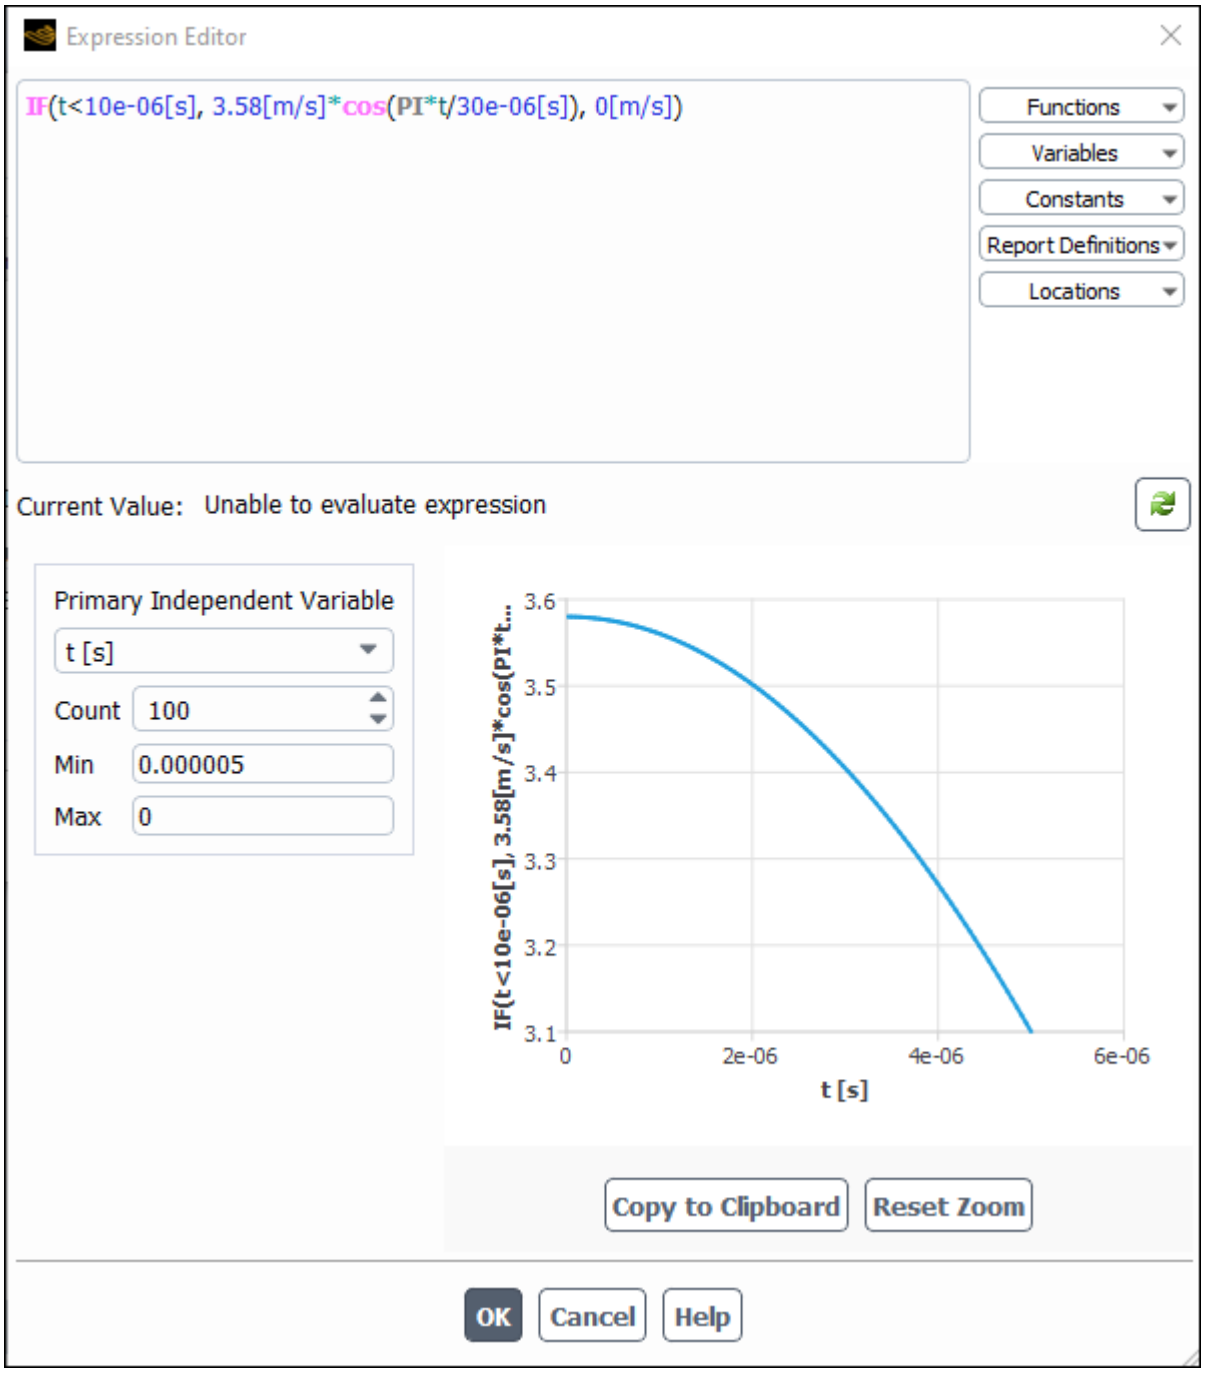
lists the available locations that you can include in your expression volume definition.

For additional information on expressions, refer to Fluent Expressions Language (p. 1013).

51.2.41. Expression Editor Dialog Box

The **Expression Editor** dialog box is used for setting expressions for fields, such as velocity, material density, and so on. It is opened by selecting **Expression** in the drop-down list for that field, and clicking the button that appears. Refer to Directly Applied Expressions (p. 1025) for additional information.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Current Value

Displays the current value of the expression.

Refresh Current Value

Evaluates the expression and updates the **Current Value** field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Primary Independent Variable

allows you to select which variable is the independent variable.

Count

allows you to specify the number of plot points.

Min

sets the minimum value for the independent variable.

Max

sets the maximum value for the independent variable.

Secondary Independent Variable

allows you to select the secondary independent variable.

Curves

allows you to specify the number of lines or curves to include in the plot.

Min

sets the minimum value for the secondary independent variable.

Max

sets the maximum value for the secondary independent variable.

Copy to Clipboard

copies the current plot onto your clipboard.

Reset Zoom

resets to the default zoom. *You can click and drag in the plot to change the zoom level.*

Drop-downs

The items in these drop-downs may be used in creating named expressions.

Functions

lists the available functions (conditional, mathematical, and so on) that are available for constructing your expression.

Variables

lists all of the supported variables.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cell Registers

lists the defined cell registers.

Constants

lists the available pre-defined constants.

Expressions

lists the defined expressions.

Report Definitions

lists the defined report definitions.

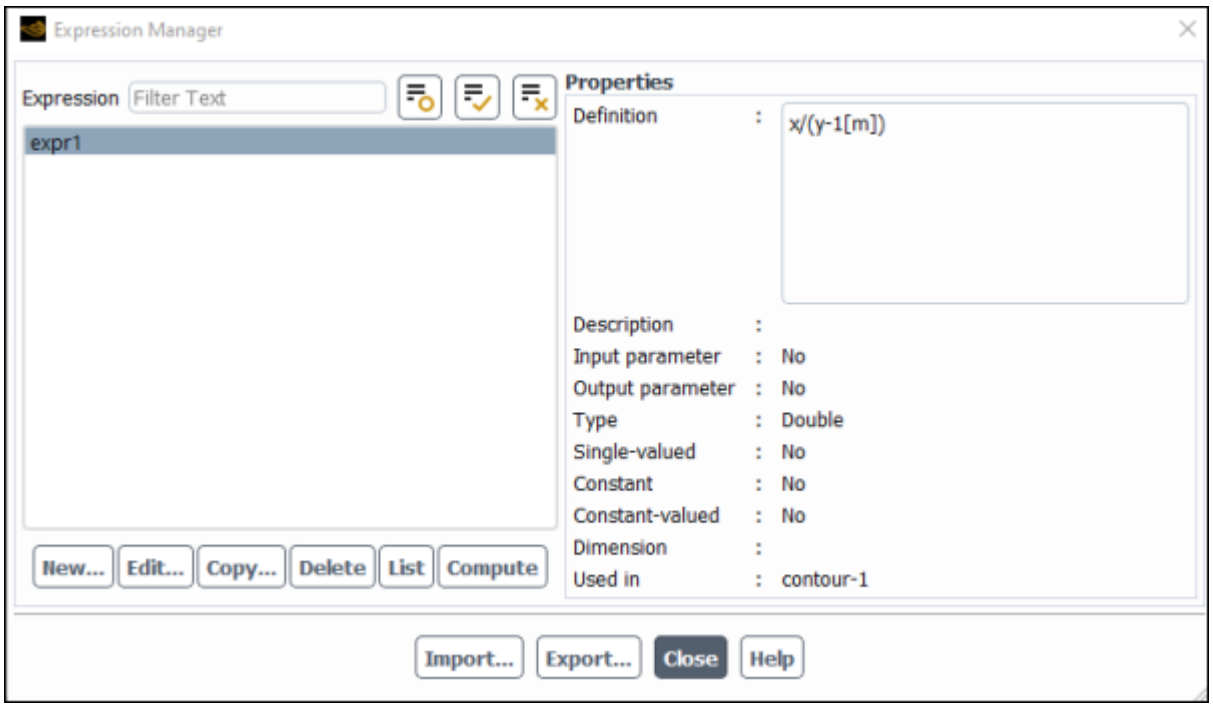
Locations

lists the available locations that you can include in your expression volume definition.

For additional information on expressions, refer to Fluent Expressions Language (p. 1013).

51.2.42. Expression Manager Dialog Box

Setup → Named Expressions → Manage...



Controls

Expression

Lists the defined named expressions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Properties

Lists the properties of the selected expression in the **Expression** list. *This list is blank when no expressions are selected or when more than one expression is selected.*

New...

Opens the Expression Dialog Box (p. 5405), allowing you to create a new named expression.

Edit...

(Only available when a single expression is selected) Opens the Expression Dialog Box (p. 5405), allowing you to edit the selected expression.

Copy...

(Only available when a single expression is selected) Opens the Expression Dialog Box (p. 5405) with the same definition as the selected expression. The **Name** field is automatically appended with a digit, but you may modify the name, if desired.

Delete

Deletes the selected expression(s). Note that some expressions cannot be deleted if they are included in the definitions of other expressions or if they are in use elsewhere in Fluent.

List

Prints the definition and description of all named expressions to the console.

Compute

Computes the value of the selected expression(s) and prints the value(s) to the console.

Import...

Opens the **Select File** dialog box so that you can read-in one or more expressions from a file.

Export...

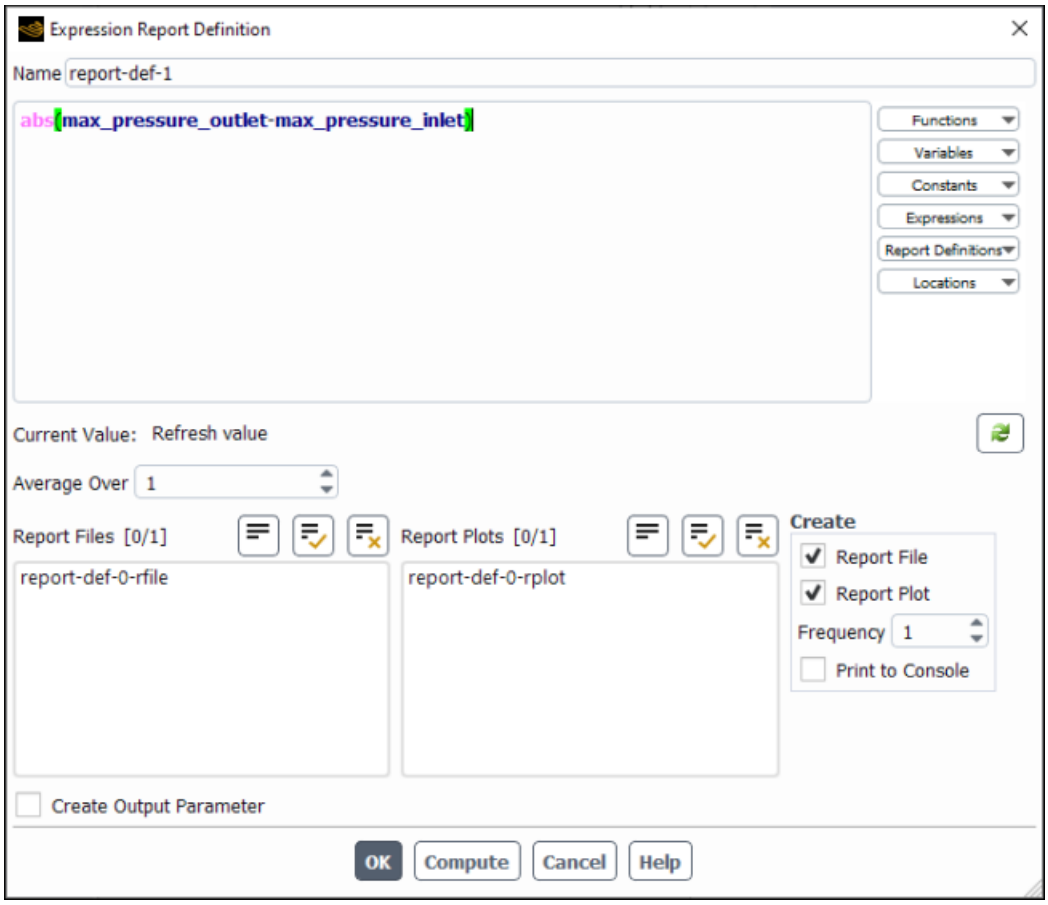
Opens the **Select File** dialog box so that you can export the selected expression(s) to a file.

For additional information on expressions, refer to Expression Manager (p. 1037).

51.2.43. Expression Report Definition Dialog Box

Solution → **Reports** → **Definitions** → **New** → **Expression...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

an editable field allowing you to name the expression. *The **Name** field is not editable when the expression is in use.*

Definition

displays the formula of the expression as you create it.

Current Value

Displays the current value of the expression.

Refresh Current Value

Evaluates the expression and updates the **Current Value** field.

Average Over

(optional) To have Fluent calculate a running average for the **Expression Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Compute

prints the value of the expression report definition to the Console.

Drop-downs

The items in these drop-downs may be used in creating expression report definitions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Functions

lists the available functions (conditional, mathematical, and so on) that are available for constructing your expression.

Variables

lists all of the supported variables.

Cell Registers

lists the defined cell registers.

Constants

lists the available pre-defined constants.

Expressions

lists the defined expressions.

Report Definitions

lists the defined report definitions.

Locations

lists the available locations that you can include in your expression report definition.

For additional information on expression report definitions, refer to Expression Report Definition (p. 4087).

51.2.44. Expression Volume Dialog Box

Results → Surface → Create → Expression Volume...

Controls

Name

an editable field allowing you to name the expression volume.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Definition

displays the formula of the expression volume as you create it.

Create

creates the expression volume.

Save

saves the changes you made to an existing expression volume.

Drop-downs

The items in these drop-downs may be used in creating expression report definitions.

Functions

lists the available functions (conditional, mathematical, and so on) that are available for constructing your expression.

Variables

lists all of the supported variables.

Cell Registers

lists the defined cell registers.

Constants

lists the available pre-defined constants.

Expressions

lists the defined expressions.

Report Definitions

lists the defined report definitions.

Locations

lists the available locations that you can include in your expression volume definition.

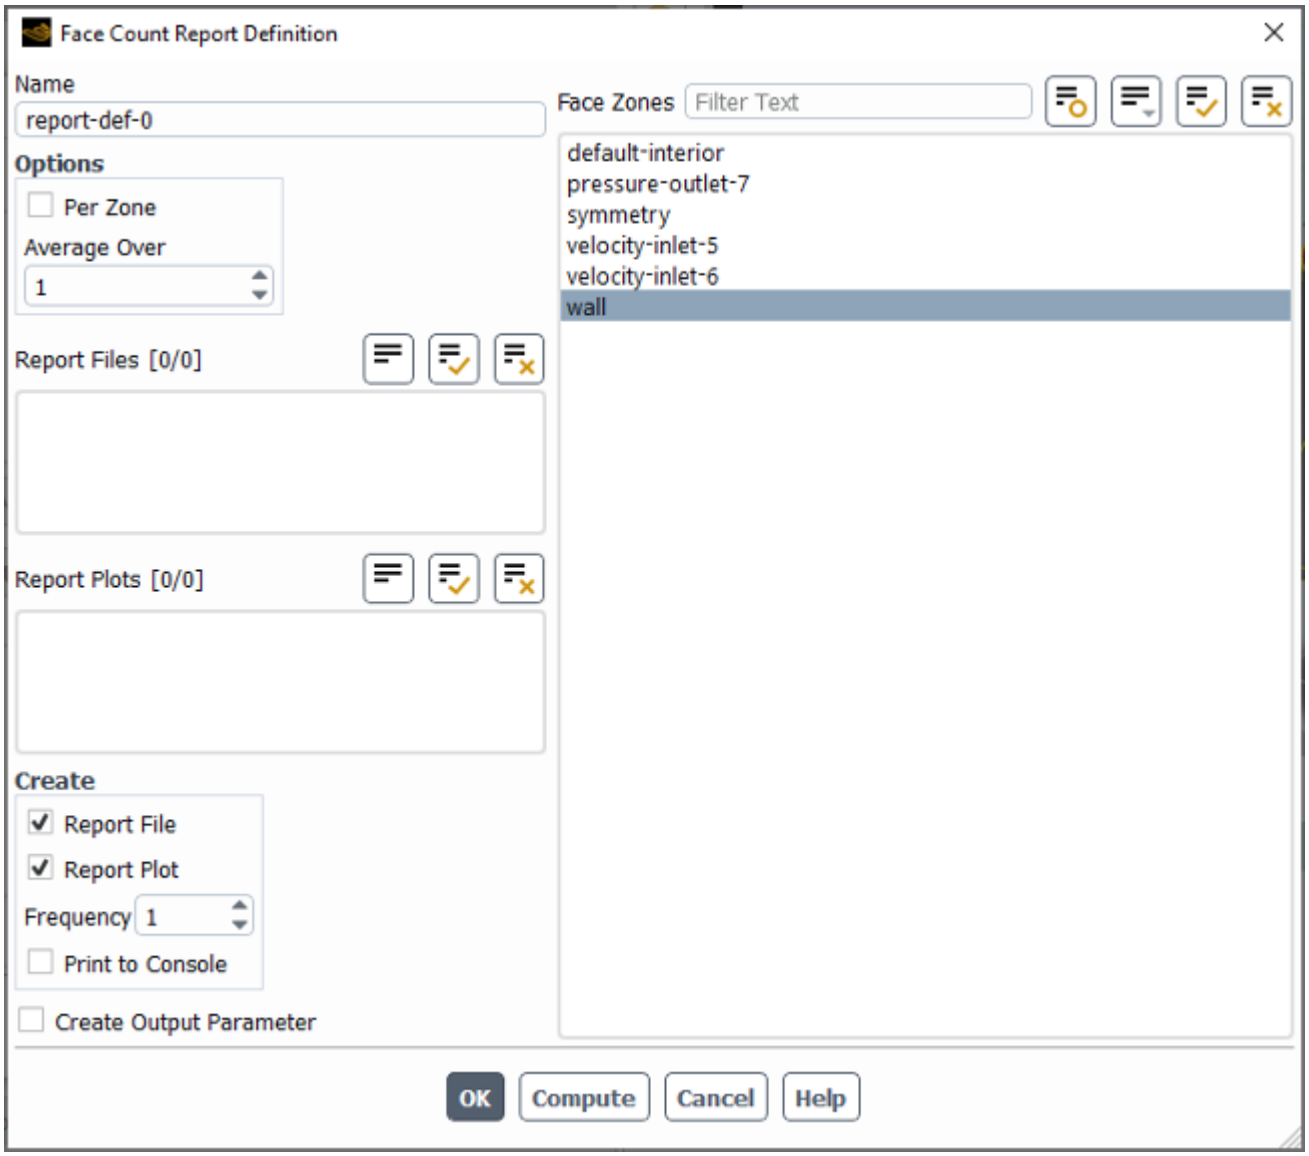
For additional information on expression report definitions, refer to Expression Report Definition (p. 4087).

51.2.45. Face Count Report Definition Dialog Box

The **Face Count Report Definition** dialog box allows you to create a report definition for the reporting of a face count (that is, the number of faces within one or more boundary zones), as described in Mesh Report Definitions (p. 4080).

Solution → Reports → Definitions → New → Mesh Report → Face Count...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

Per Surface

enables the reporting of the face count individually for each of the selected zones (rather than reporting the sum from all of the selected zones).

Average Over

specifies the number of iterations / time steps over which the face count is averaged when written, plotted, and/or printed. The default value of 1 means that no averaging is performed (that is, only the current face count is reported), and higher values yields a running average.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When the iteration / time step number is lower than the specified value, Fluent calculates the average of the available face count values.

Retain Instantaneous Values

enables the retention of instantaneous values in any report file definition or report plot definition that is associated with this report definition. This option is only available if **Average Over** is set to a value greater than 1.

Report Files

allows you to select existing report file definitions to which you want to write face count data from this report definition.

Report Plots

allows you to select existing report plot definitions to which you want to include face count data from this report definition. Note that the units used in these report plots may not be suitable for the face count data.

Create

Report File

creates a new report file definition for the data from this report definition.

Report Plot

creates a new report plot definition for the data from this report definition.

Frequency

specifies how frequently the report definition is written, plotted, and/or printed to the console.

Print to Console

enables the printing of the face count data from this report definition to the console during the calculation.

Create Output Parameter

creates an output parameter for this report definition with the name *<report_definition_name>*-op.

Face Zones

allows you to select the face zones for which you want to report the number of faces.

OK

creates / saves the report definition.

Compute

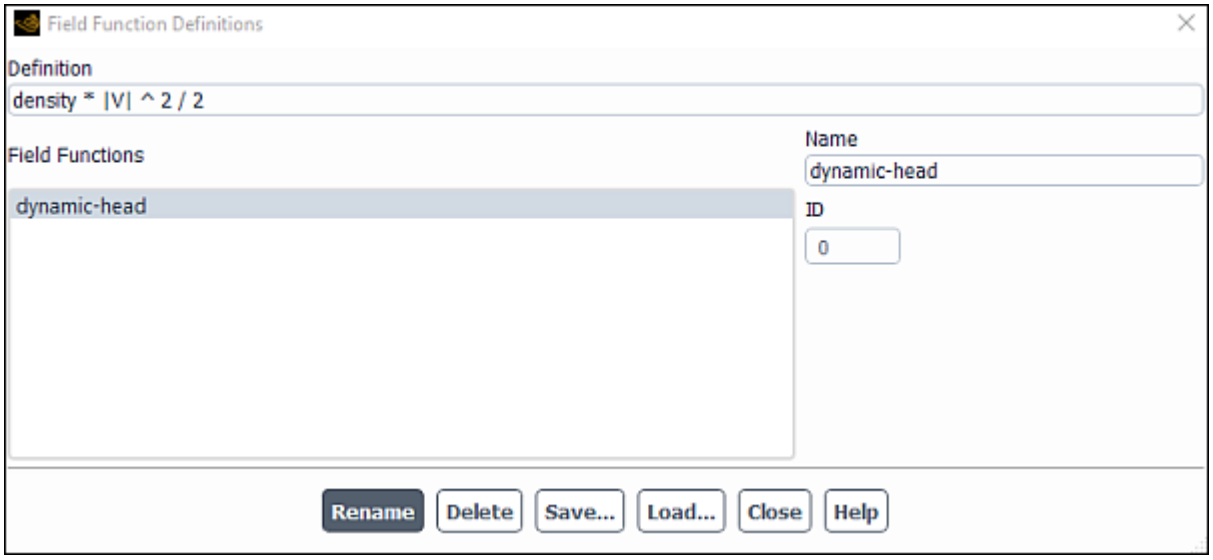
computes the face count within the selected zone(s) and prints to the console.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.46. Field Function Definitions Dialog Box

The **Field Function Definitions** dialog box allows you to check, rename, save, load, and delete custom field functions that you defined in the Custom Field Function Calculator Dialog Box (p. 5372). See Manipulating, Saving, and Loading Custom Field Functions (p. 4255) for details about the items below.

The **Field Function Definitions** dialog box is opened from the Custom Field Function Calculator Dialog Box (p. 5372).



Controls

Definition

displays the function selected in the **Field Functions** list. This display is for informational purposes only; you cannot edit it.

Field Functions

contains a selectable list of custom field functions. When you select a function, its definition will appear in the **Definition** box and its name will appear in the **Name** text entry box.

Name

displays the name of the currently selected field function. You can enter a new name in this box if you want to rename the function.

ID

reports the ID number of the selected function. The field function at the top of the list has an ID of 0, the second function has an ID of 1, and so on.

Rename

changes the name of the selected function to the name specified in the **Name** text entry box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

deletes the selected field function.

Save...

opens The Select File Dialog Box (p. 907), where you can specify a file in which to save all of the functions in the **Field Functions** list.

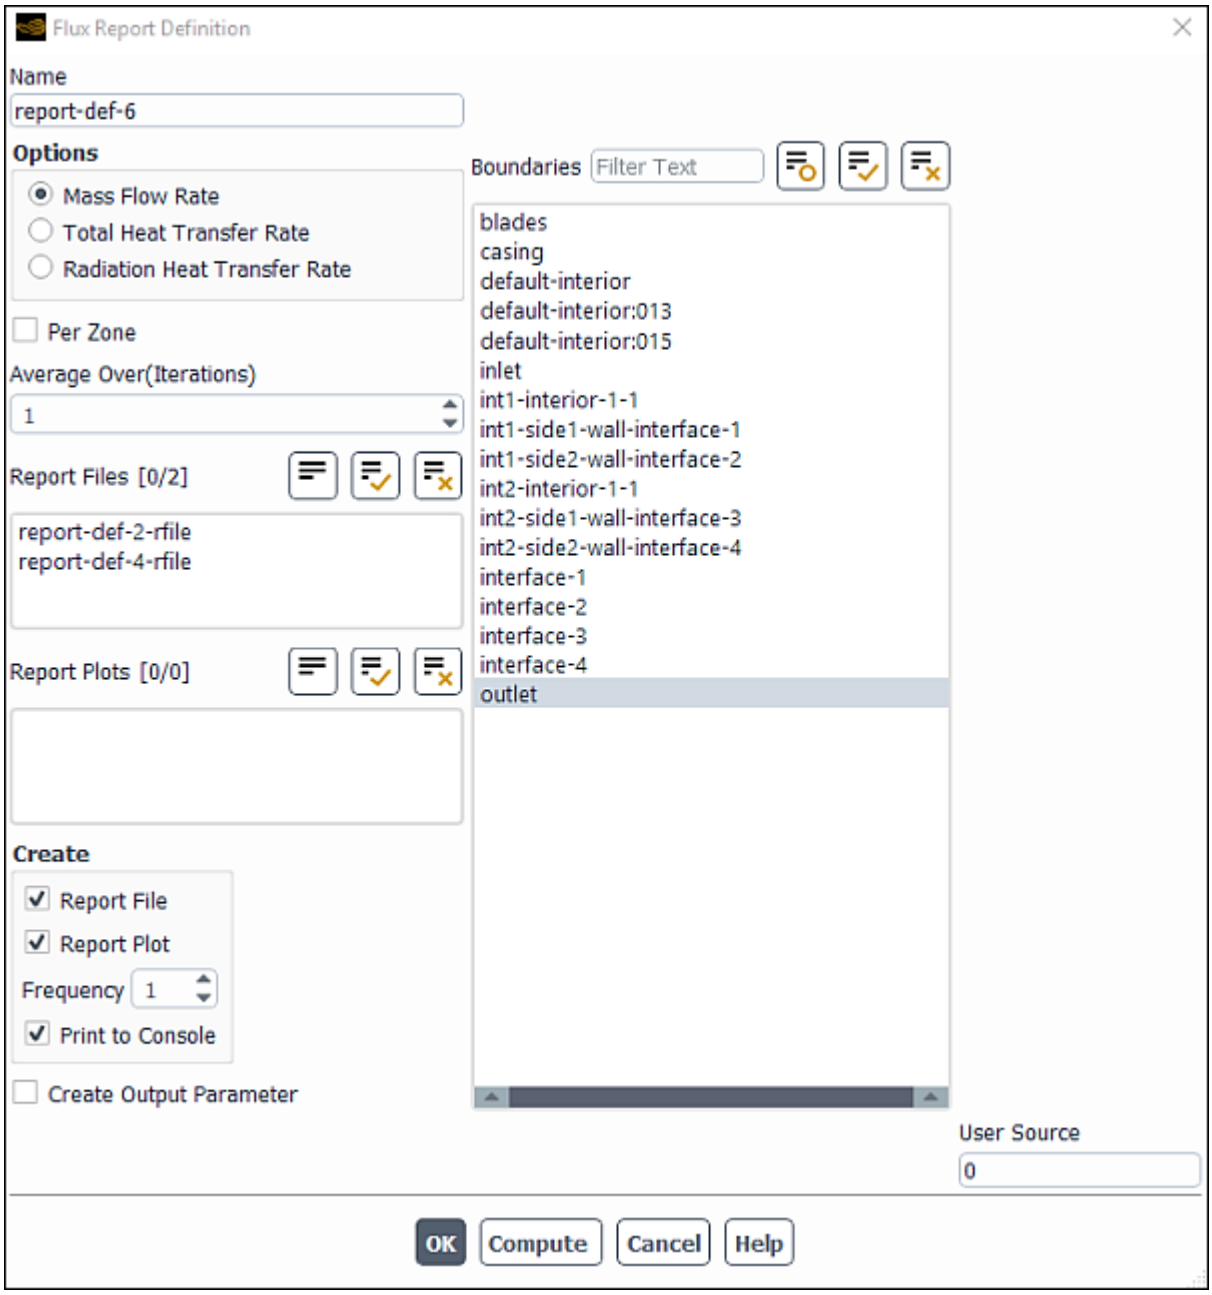
Load...

opens the **Select File** dialog box, where you can specify a file from which to read custom field functions (that is, a file that you saved using the **Save...** button above).

51.2.47. Flux Report Definition Dialog Box

Solution → **Reports** → **Definitions** → **New** → **Flux Report**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

Mass Flow Rate

specifies that the mass flow rate is computed for the selected boundary zones.

Total Heat Transfer Rate

specifies that the total heat transfer rate is computed for the selected boundary zones.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Total Sensible Heat Transfer Rate

specifies that the total sensible heat transfer rate is computed for the selected boundary zones. It reports the total energy flux as defined in Equation 5.5 in the Theory Guide.

Radiation Heat Transfer Rate

specifies that the radiation heat transfer rate is computed for the selected boundary zones.

Pressure Work Rate

specifies that the pressure work rate is computed for the selected boundary zones. This rate is the energy transfer due to pressure when a fluid zone undergoes normal zone motion relative to an adjacent solid zone (for further details, see Equation 26.1 in the Theory Guide). This pressure work is on the fluid side only, not on the solid side. This option is only available when the energy equation is enabled, the absolute velocity formulation is selected, and the **Frame Motion** and/or **Mesh Motion** option is enabled in the **Fluid** dialog box.

Viscous Work Rate

specifies that the viscous work rate is computed for the selected boundary zones, which is the integral of the product of viscous stress with velocity over the external boundary of the domain with the boundary normal directed inside (for further details, see Equation 26.2 in the Theory Guide). Note that after reading case and data files into Ansys Fluent, the viscous work rate is zero. You need to run at least one iteration or time step to obtain the viscous work rate value. This item is available only when the energy equation is enabled and the pressure-based solver is selected.

Film Mass Flow Rate

(available only when the Eulerian wall film model is enabled) specifies that the mass flow rate is computed for the selected boundary zone(s).

Film Heat Transfer Rate

(available only when the Eulerian wall film model is enabled) specifies that the film heat transfer rate is computed for the selected boundary zone(s).

Phase

contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Per Zone

specifies whether or not the chosen field variable is calculated from all of the selected boundary zones combined (default) or individually on each of the selected boundary zones.

Average Over (Time-Steps), Average Over (Iterations)

(optional) To have Fluent calculate a running average for the **Flux Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Report Type

selects the integration method used on the selected cell zones. The available report types are the same as those in the Volume Integrals Dialog Box (p. 5275). See Volume Integration (p. 4119) for details.

Boundaries

contains a selectable list of valid boundary zones for flux reporting.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OK

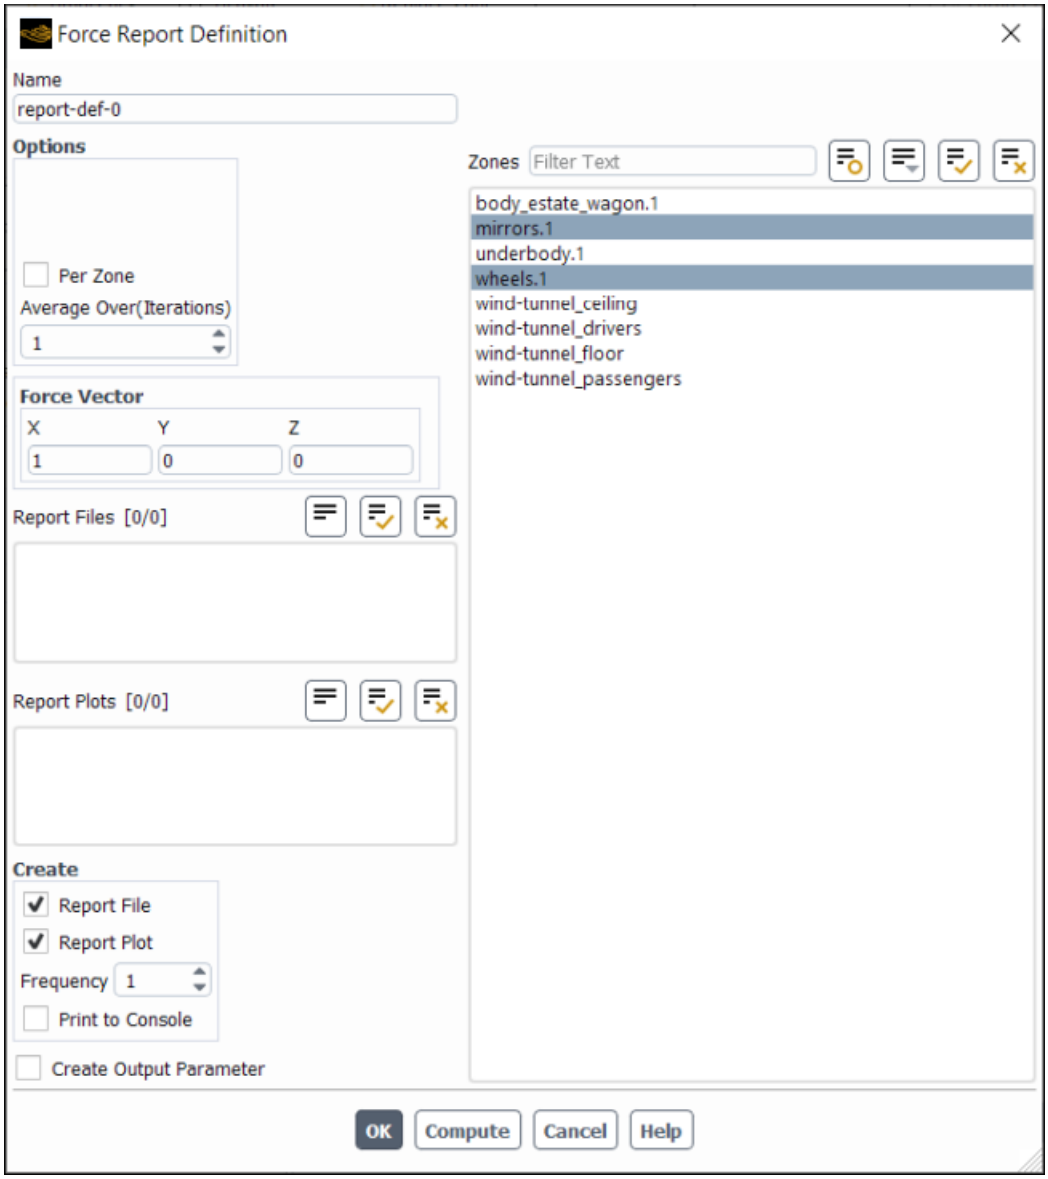
creates the report definition.

Compute

computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.48. Force Report Definition Dialog Box

Solution → Reports → Definitions → New → Force Report → Force...



Controls

Name

specifies the name of the report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

Per Zone

specifies whether or not the force for multiple walls zones should be monitored on each wall zone separately. When this option is turned off (the default), Fluent computes and monitors the total force for all of the selected walls zones combined together.

Average Over (Time-Steps), Average Over (Iterations)

(optional) To have Fluent calculate a running average for the **Force Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Force Vector

contains the components of the force vector.

X,Y,Z

are the components of the force vector along which the forces will be computed.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Zones

lists the zones you can select for force computation.

OK

creates the report definition.

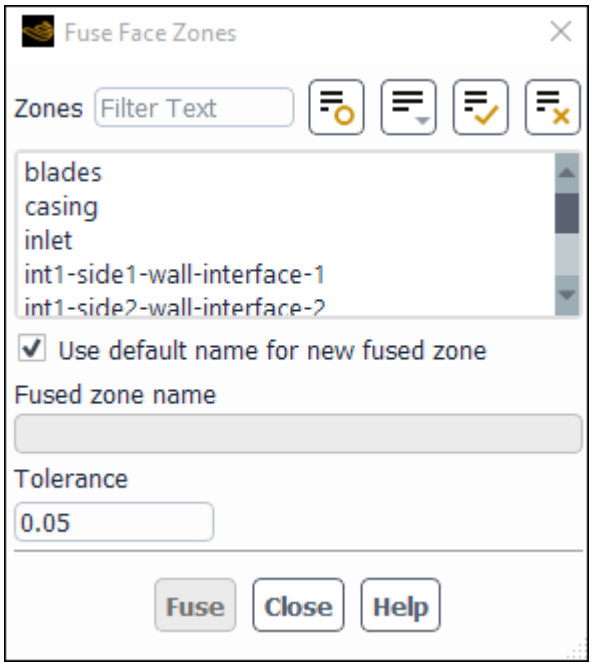
Compute

computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.49. Fuse Face Zones Dialog Box

The **Fuse Face Zones** dialog box allows you to fuse boundaries (that is, remove duplicate nodes and faces and delete artificial internal boundaries) created by assembling multiple mesh regions. (See Reading Multiple Mesh/Case/Data Files (p. 1135) for details on importing such meshes.) See Fusing Face Zones (p. 1244) for information about using this dialog box.

Domain → **Zones** → **Combine...** → **Fuse...**



Controls

Zones

contains a list of face zones from which you can select the boundaries to be fused.

Use default name for new fused zone

specifies whether to use an automatically generated default name for the fused zone.

Fused zone name

specifies the desired name for the fused zone if **Use default name for new fused zone** is disabled.

Tolerance

is a fraction of the minimum edge length of the face, used to determine whether or not nodes are coincident. If all of the appropriate faces do not get fused using the default **Tolerance**, you should increase it and attempt to fuse the zones again. The **Tolerance** should not exceed 0.5, or you may fuse the wrong nodes.

Fuse

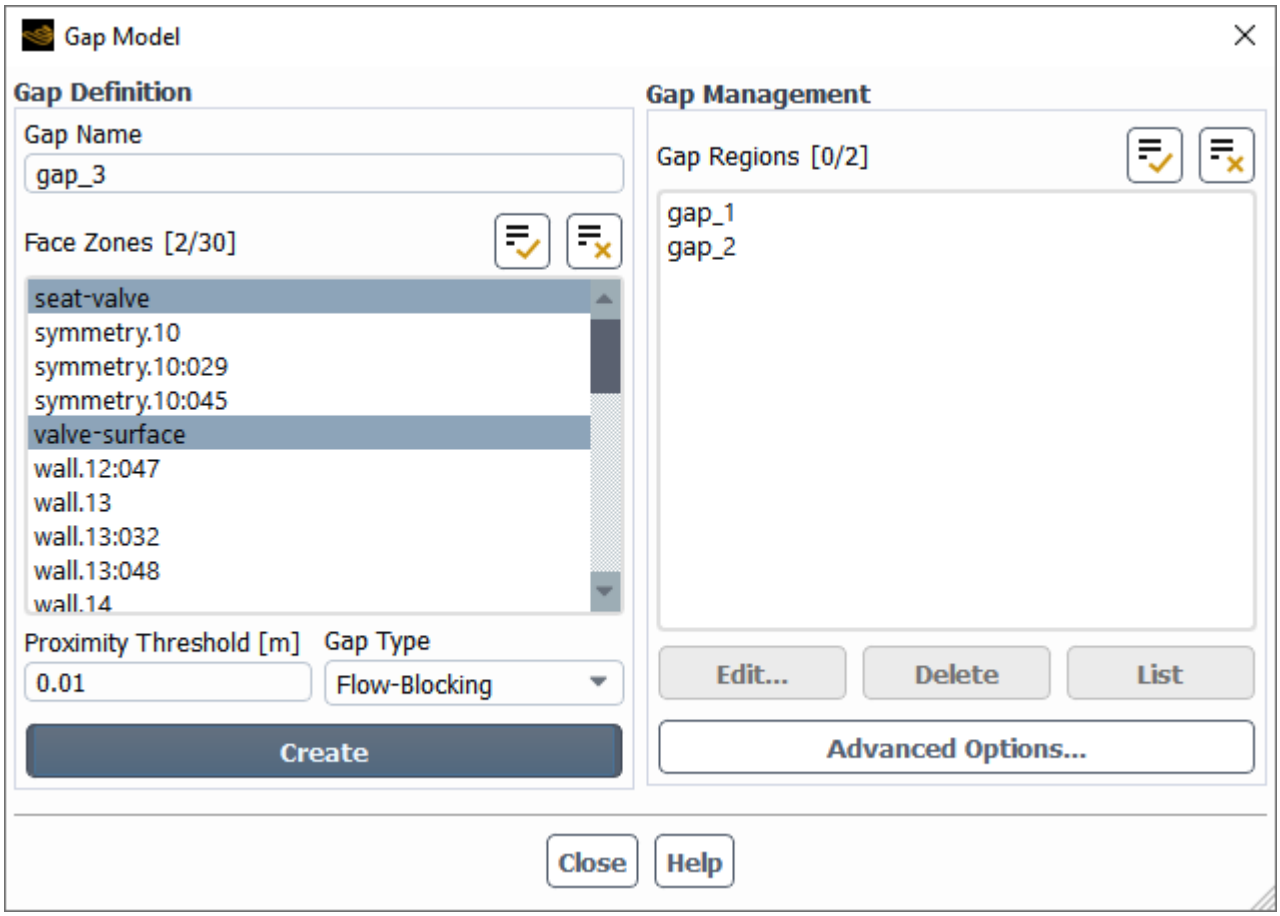
fuses the selected zones. It is enabled only when you have selected a minimum of two zones.

51.2.50. Gap Model Dialog Box

The **Gap Model** dialog box allows you to create gap regions for use with dynamic meshes (see Using Dynamic Meshes (p. 1780)), overset meshes (see Overset Meshes (p. 1183)), and/or sliding meshes (see Using Sliding Meshes (p. 1772)) to simulate flow through narrow gaps that open or close over time (such as in a valve or rotary pump). For information about using this dialog box, see Controlling Flow in Narrow Gaps for Valves and Pumps (p. 1211).

Domain → **Mesh Models** → **Gap Model...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Gap Definition

allows you to create one or more gap regions. A gap region is made up of two or more face zones, so that when one moves within a specified proximity threshold distance of another, the fluid cells within the threshold of the zones are marked, and then the flow in the cells is blocked or decelerated.

Gap Name

specifies the name of the gap region created by the **Create** button. It cannot consist solely of numbers.

Face Zones

allows you to select the two or more face zones that make up the gap region created by the **Create** button.

Proximity Threshold

defines the maximum distance between the face zones when flow blockage / deceleration occurs in the gap region created by the **Create** button.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gap Type

defines the type of the gap region. A **Flow-Blocking** type completely blocks the flow in the gap region, as a numerical zero-mass-flux boundary condition is applied at the boundary faces of the marked region so that the marked cells no longer participate in the solution. A **Flow-Modeling** type decelerates the flow in the cells of the marked region by manipulating the viscosity or source terms.

Gap Reynolds Number

defines the intended Reynolds number in the gap region, and thus determines the level of sealing. A lower **Gap Reynolds Number** results in better sealing. It can be estimated according to Equation 6.4 (p. 1215). This drop-down list is only available when **Flow-Modeling** is selected for the **Gap Type**.

Create

creates a gap region.

Gap Management

allows you to manage existing gap regions and set advanced controls for the simulation.

Gap Regions

allows you to select gap regions that you want to manage using the other buttons in the group box.

Edit...

opens the Edit Gap Region Dialog Box (p. 5395), which you can use to edit or complete the definition of a single selected gap region.

Delete

deletes the selected gap regions.

List

prints information in the console about the selected gap regions.

Advanced Options...

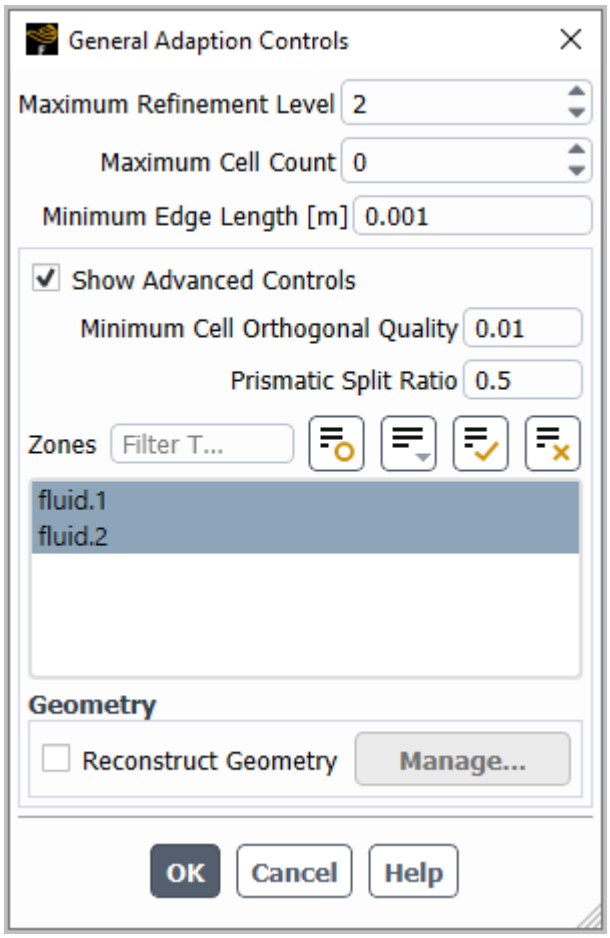
opens the Advanced Options Dialog Box (p. 5339), where you can define additional options (such as the level of solution stabilization for the simulation).

51.2.51. General Adaption Controls Dialog Box

The **General Adaption Controls** dialog box allows you to specify the general settings that Fluent uses when adapting the mesh. See Refining and Coarsening (p. 3759) for details.

Domain → **Adapt** → **Controls...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Maximum Refinement Level

controls the number of levels of refinement used to split cells during the adaption. A value of zero places no limits on the number of levels.

Maximum Cell Count

sets an approximate limit to the total cell count of the mesh. Fluent uses this value to determine when to stop marking cells for refinement. A value of zero places no limits on the number of cells. This field is only available with the PUMA adaption method.

Minimum Edge Length

sets an approximate limit to the edge length for cells that are considered for refinement. Even if a cell is marked for refinement, it will not be refined if (for 3D) its volume is less than the cube of this field or (for 2D) its area is less than the square of this field. The default value of zero places no limits on the size of cells that are refined.

Show Advanced Controls

reveals additional advanced options for adaption.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Additional Refinement Layers

allows you to specify additional cell layers for refining the mesh. This field is only available for transient simulations.

Prismatic Split Ratio

sets the split ratio for the cells as part of the **Prismatic Adaption** option in the Manual Mesh Adaption Dialog Box (p. 5459) or Automatic Mesh Adaption Dialog Box (p. 5348).

Minimum Cell Orthogonal Quality

specifies the minimum orthogonal quality that you would like Fluent to attempt to maintain in the cells that result from adaption. Note that this value is not guaranteed to be maintained, as to do so would negatively affect the solution speed. The worse quality cells will have an orthogonal quality closer to 0 and better quality cells will have an orthogonal quality closer to 1. This field is not available for 2D cases or if the hanging node adaption method is selected.

Zones

contains a list of cell zones from which you can select the zones in which to perform adaption (or marking). By default, all cell zones are selected.

Geometry

contains controls for geometry-based adaption when using the PUMA adaption method.

Reconstruct Geometry

enables geometry-based adaption, using the definitions created through the Manage Geometry-Based Adaption Dialog Box (p. 5462) to produce refined wall zones that better conform to specified auxiliary geometry definitions.

Manage...

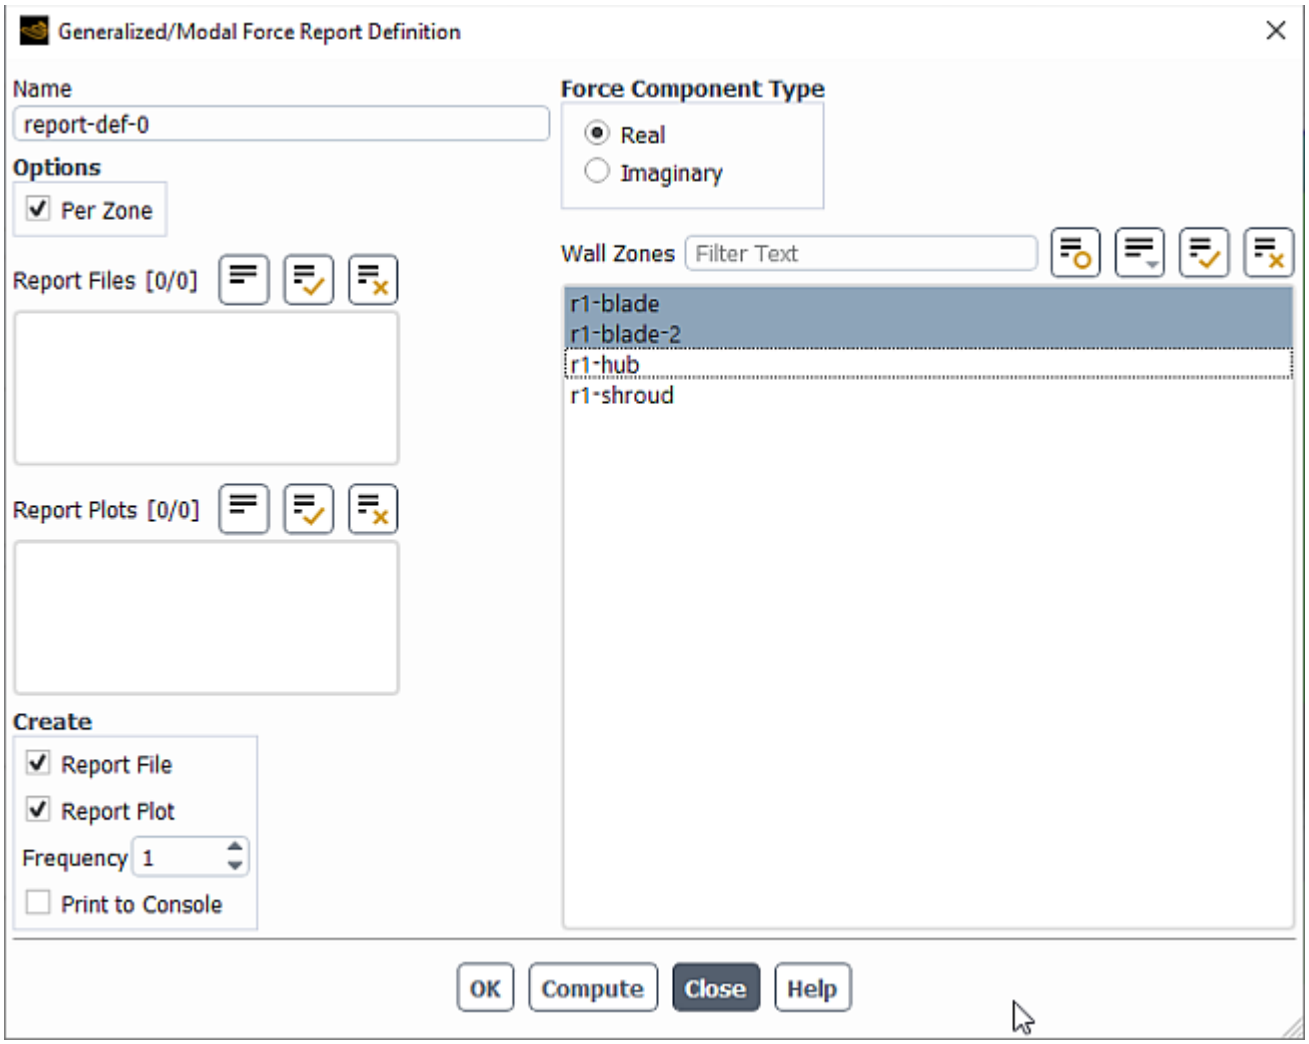
opens the Manage Geometry-Based Adaption Dialog Box (p. 5462), which you can use to specify which wall zones conform to which auxiliary geometry definitions.

51.2.52. Generalized/Modal Force Report Definition Dialog Box

For more details, see ICM Method Post-processing (p. 1967).

Solution → Reports → Definitions → New → Aeromechanics Report → Generalized/Modal Force...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

contains options for your aerodamping report definition.

Per Zone

If you are modeling multiple (main) blades, enables the force value to be calculated for each dynamic mesh zone (which encompasses one main blade and possibly accompanying splitter blades).

Report Files

lists all of the report files where you can write the report definition data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Force Component Type

specifies the output **Real** or **Imaginary** force on the blade.

Wall Zones

contains a selectable list of valid walls zones for force report.

OK

creates the report definition.

Compute

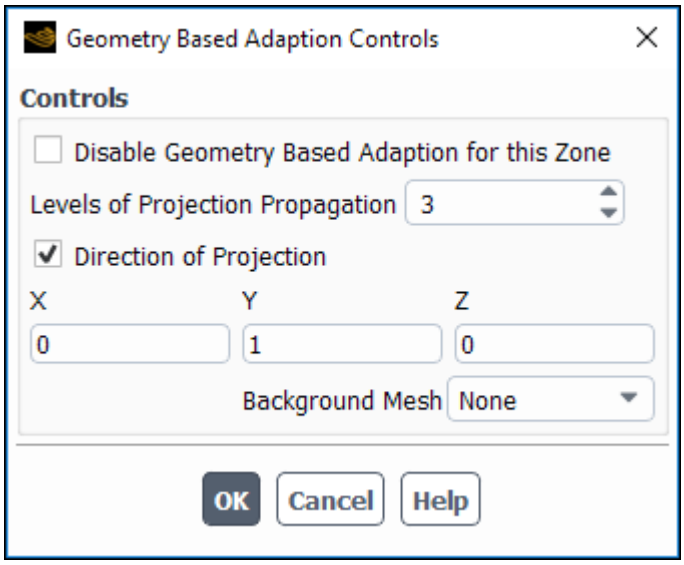
computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.53. Geometry Based Adaption Controls Dialog Box

The **Geometry Based Adaption Controls** dialog box allows you to set projections. See Performing Geometry-Based Adaption with the Hanging Node Method (p. 3791) for details about the items below.

The **Geometry Based Adaption Controls** dialog box is opened from the Geometry Based Adaption Dialog Box (p. 5435).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Controls

contains parameters to define geometry based adaption.

Disable Geometry Based Adaption for this Zone

disables the geometry reconstruction for selected zones in the domain.

Levels of Projection Propagation

is the number of layers of the nodes you want to project.

Direction of Projection

allows you to specify the direction in which you want to project the nodes.

Background Mesh

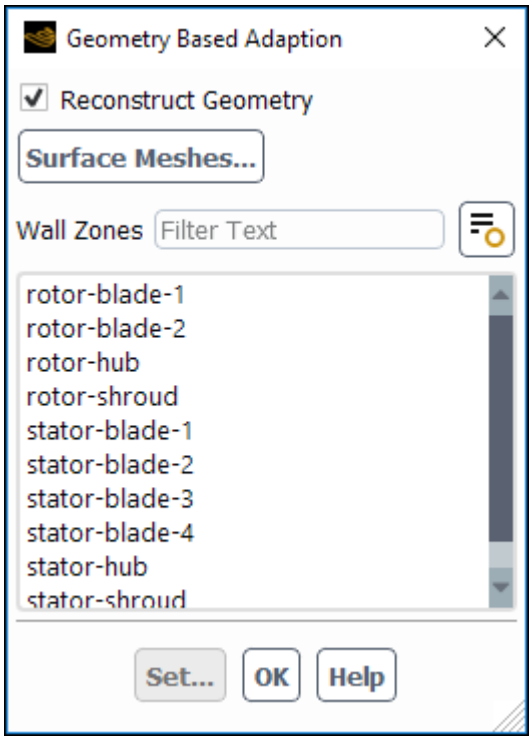
allows you to load the surface mesh as a background mesh for adaption.

51.2.54. Geometry Based Adaption Dialog Box

The **Geometry Based Adaption** dialog box allows you to reconstruct the geometry while performing boundary adaption. See Geometry-Based Adaption with the Hanging Node Method (p. 3790) for details. It is only available for 2D cases or when the hanging node adaption method is selected (through the `mesh/adapt/set/method` text command).

Domain → Adapt → More → Geometry...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reconstruct Geometry

enables geometry based adaption parameters.

Surface Meshes...

opens the Surface Meshes Dialog Box (p. 5566).

Wall Zones

allows you to select the wall zones you want to adapt.

Set...

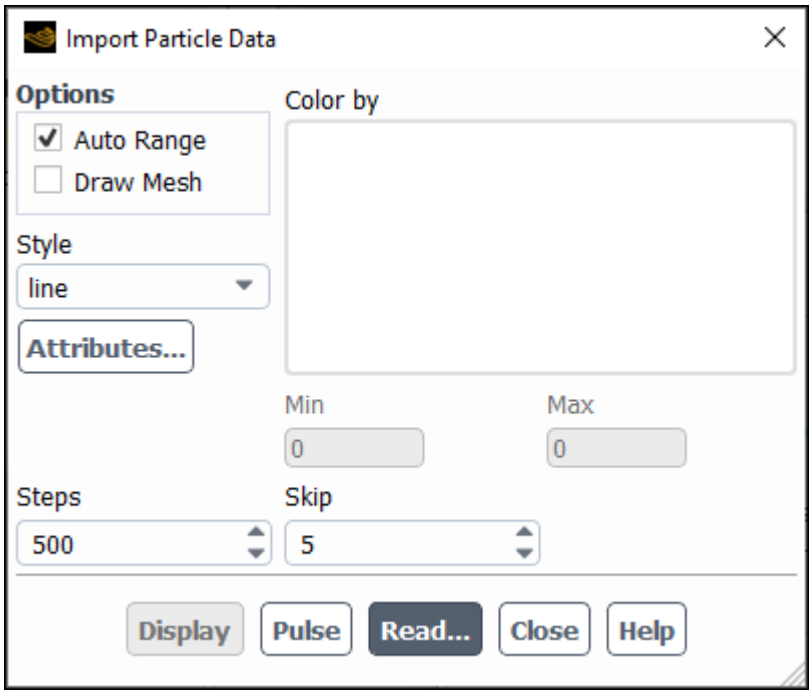
opens the Geometry Based Adaption Controls Dialog Box (p. 5434).

51.2.55. Import Particle Data Dialog Box

The **Import Particle Data** dialog box allows you to import particle history data for display purposes in transient cases. See Importing Particle Data (p. 2841) for details.

Results → Model Specific → Discrete Phase → Import Particle Data...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the check buttons that set various import particle data options.

Auto Range

toggles between automatic and manual setting of the particle data range.

Draw Mesh

toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 4636) is opened when **Draw Mesh** is selected.

Style

allows you to select pathline style.

Attributes...

opens the Path Style Attributes Dialog Box (p. 5189). This allows you to modify the line width, cylinder radius or marker size.

Color by

contains a list from which you can select the scalar field to be used to color the particle data.

Min,Max

allows you to set the range when **Auto Range** is disabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Steps

sets the maximum number of steps a particle can advance.

Skip

allows you to "thin out" the pathlines.

Display

displays pathlines.

Pulse

animates the particle positions. The **Pulse** button will become the **Stop !** button during the animation, and you must click **Stop !** to stop the pulsing.

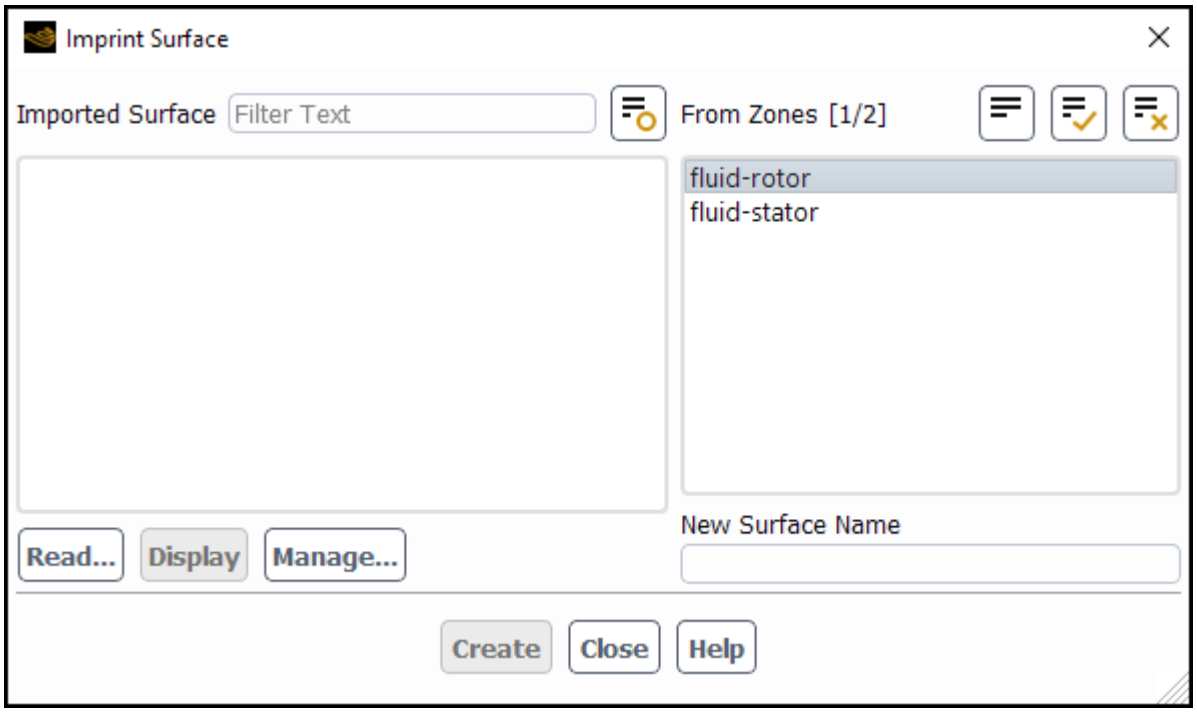
Read...

opens a file selection dialog box where you can enter a file name and a directory for the imported data.

51.2.56. Imprint Surface Dialog Box

The **Imprint Surface** dialog box allows you to define a surface on top of an existing cell zone for postprocessing purposes. See Imprint Surfaces (p. 3799) for details about the following items.

Domain → Surface → Create → Imprint...



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Imported Surface

lists the surfaces that you have imported.

Read...

opens The Select File Dialog Box (p. 907), so that you can select surface files for import.

Display

allows you to display the selected surfaces.

Manage...

opens the Surfaces Dialog Box (p. 5571), where you can rename and delete surfaces and determine their sizes.

New Surface Name

designates the name of the new surface. The default name format is `<original-name>(imprint)-<id>`.

From Zones

allows you to select the zones where you want to import/imprint the surface mesh.

Note:

If no zone is selected, then the entire domain is considered.

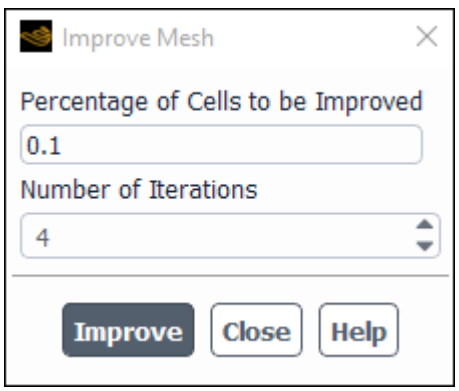
Create

creates the new surface, imprinted with the mesh of the selected cell zone.

51.2.57. Improve Mesh Dialog Box

The **Improve Mesh** dialog box controls the quality-based smoothing of the numerical mesh. See Improving the Mesh by Smoothing and Swapping (p. 1268) for details about the items below.

Domain → **Mesh** → **Improve...**



Controls

Percentage of Cells to be Improved

sets the percentage of the total cells on which improvements are attempted. Note that the cells selected for improvement are in the areas of the mesh that exhibit the lowest orthogonal quality.

Number of Iterations

defines the number of successive smoothing sweeps performed on the mesh.

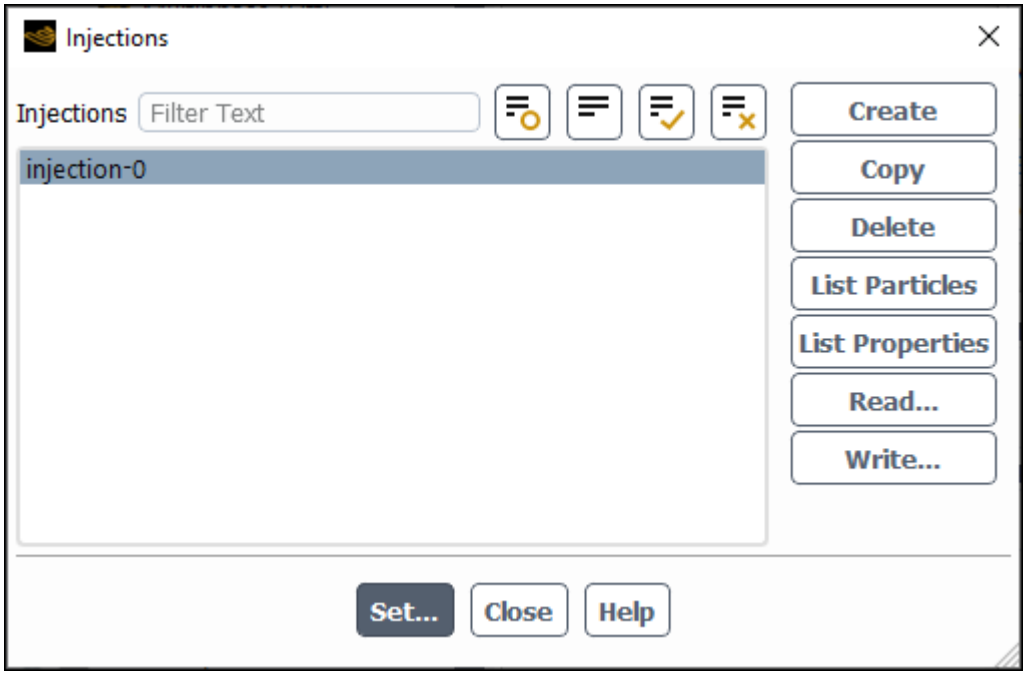
Improve

initiates the desired number of smoothing iterations.

51.2.58. Injections Dialog Box

The **Injections** dialog box allows you to create, delete, and list discrete phase injections, and access the Set Injection Properties Dialog Box (p. 5550) and the Set Multiple Injection Properties Dialog Box (p. 5563), in which you can set the properties for the injections. See Creating and Modifying Injections (p. 2751) for details.

Physics → **Model Specific** → **Discrete Phase** → **Injections...**



Controls

Injections

contains a list from which you can select one or more injections in order to set, copy, or modify properties, or delete or list injections.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create

creates a new injection and opens the Set Injection Properties Dialog Box (p. 5550), in which you can set its properties.

Copy

creates a new injection with the same properties as the selected injection and opens the Set Injection Properties Dialog Box (p. 5550) where the new injection's properties can be modified.

Delete

deletes the injection(s) selected in the **Injections** list.

List Particles

lists the initial conditions for the particle streams in the injection(s) selected in the **Injections** list.

List Properties

lists the properties of the injection(s) selected in the **Injections** list.

Read...

opens The Select File Dialog Box (p. 907) where you will select the injection file to read in.

Write...

allows you to select the injection from the list and write it to a file.

Set...

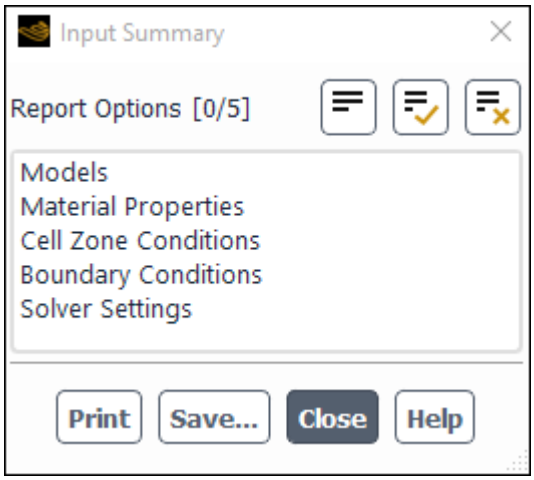
opens the Set Injection Properties Dialog Box (p. 5550) for the injection selected in the **Injections** list or the Set Multiple Injection Properties Dialog Box (p. 5563) if more than one injection is selected in the **Injections** list.

51.2.59. Input Summary Dialog Box

The **Input Summary** dialog box allows you to report the current settings for physical models, boundary conditions, material properties, and solution parameters. See Generating a Summary Report (p. 4128) for details about the items below.

Solution → **Run Calculation** → **Input Summary...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Report Options

contains a selectable list of the information that is available for the report.

Print

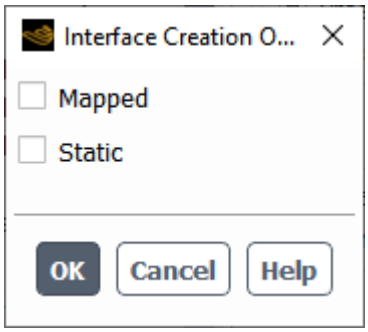
prints the selected information to the console.

Save...

opens The Select File Dialog Box (p. 907), in which you can specify the filename under which to save the output of the summary report.

51.2.60. Interface Creation Options Dialog Box

The **Interface Creation Options** dialog box allows you to define settings that you want applied to the many-to-many mesh interfaces that are created through the automatic method (for additional information, see Using a Non-Conformal Mesh in Ansys Fluent (p. 1164)). It is opened by clicking the **Options...** button in the **Boundary Zones** group box of the Mesh Interfaces Dialog Box (p. 5468). Note that this button is only available if you have disabled the default one-to-one interface creation method by using the `define/mesh-interfaces/one-to-one-pairing?` text command.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mapped

specifies that the mapped option is applied to all of the resulting interfaces for which at least one side of the interface consists of only solid zones. Note that the mapped option will be applied regardless of the mesh quality, and the tolerance used for mapping will be that specified in the Mapped Interface Options Dialog Box (p. 5464).

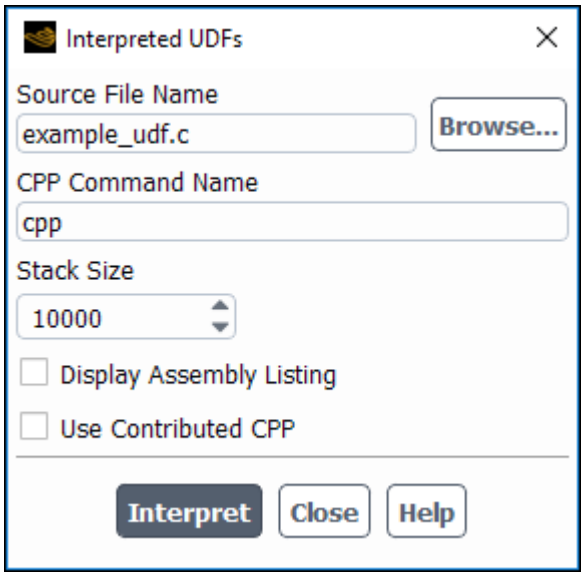
Static

reduces the memory usage and processing time for interface creation (as well as for solution), especially when you are creating interfaces using many unassigned interface zones. This option will only produce correct results if the interface zones do not move or deform relative to each other at the interfaces.

51.2.61. Interpreted UDFs Dialog Box

The **Interpreted UDFs** dialog box allows you to compile user-defined functions. See the separate Fluent Customization Manual for details.

User Defined → User Defined → Functions → Interpreted...



Controls

Source File Name

sets the name of your user-defined function.

CPP Command Name

sets the name of your C preprocessor.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stack Size

sets the size of the stack. Keep the default **Stack Size** setting of 10000, unless the number of local variables in your function will cause the stack to overflow. In this case, set the **Stack Size** to a number that is greater than the number of local variables used.

Display Assembly Listing

indicates whether or not to display a listing of assembly language code in your console window as the function compiles.

Use Contributed CPP

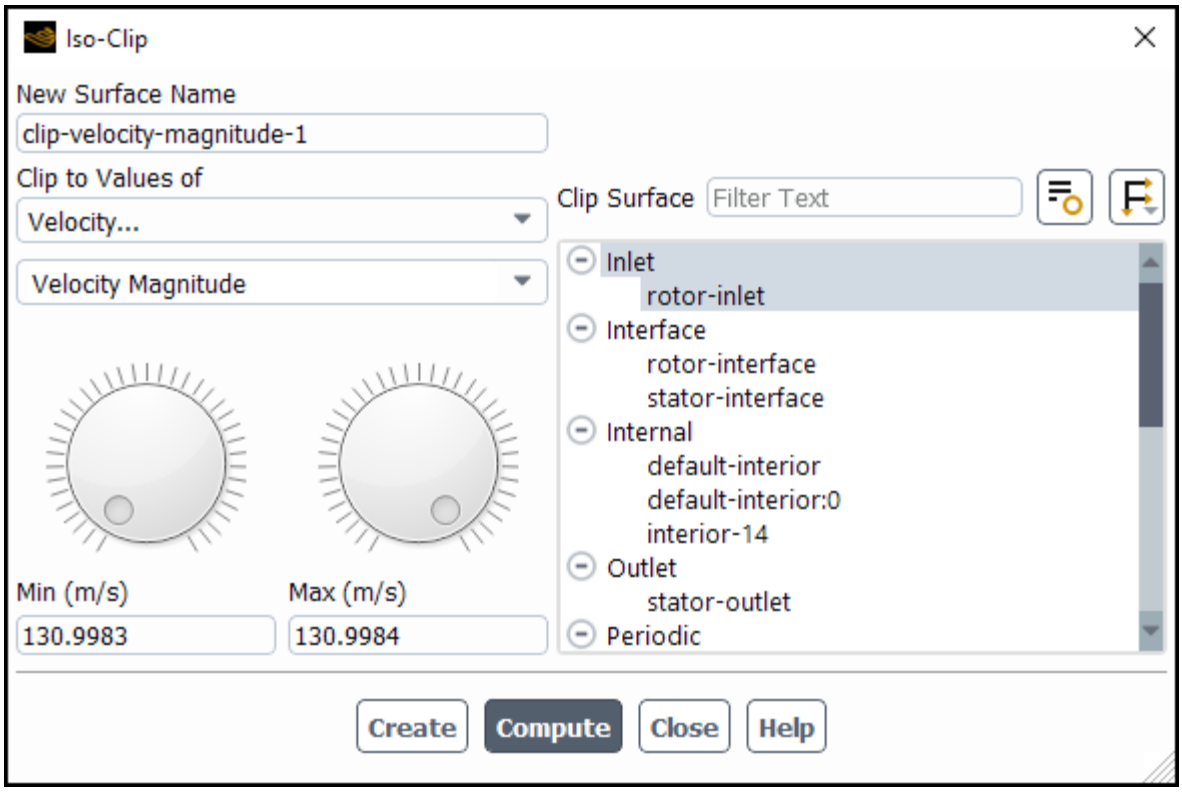
specifies the use of the C preprocessor that Ansys Fluent has supplied, instead of your own.

Interpret

interprets the specified function.

51.2.62. Iso-Clip Dialog Box

The **Iso-Clip** dialog box allows you to interactively clip surfaces. The clipped surface consists of those points on the selected surface where the scalar field values are within the specified range. See Clipping Surfaces (p. 3820) for details about the items below.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Clip to Values of

contains a list from which you can select the scalar field to be used for clipping.

Phase

allows you to select the phase when one of the multiphase models is selected in the Multiphase Model Dialog Box (p. 4648).

Min, Max

set the minimum and maximum values in the clipping range. There are two ways you can set the **Min** and **Max**:

- You can set a value interactively by moving the indicator in the dial above the **Min** or **Max** field with the left mouse button. This will also create a temporary surface in the graphics window. Using the dial allows you to preview the clipped surfaces before defining them. Note: Even though the clipped surface is displayed, it is only a temporary surface. To clip the surface, use the **Clip** button after deciding on the minimum and maximum values.
- You can type in values in the **Min** and **Max** fields directly.

Clip Surface

contains a list of surfaces from which you can select the surface to be clipped. You must select a surface to make the **Clip** button available.

New Surface Name

designates the name of the surface to be created. The default is the concatenation of the surface type and an integer which is the new surface ID.

Clip

creates the clipped surface. (The original surface will remain unchanged.)

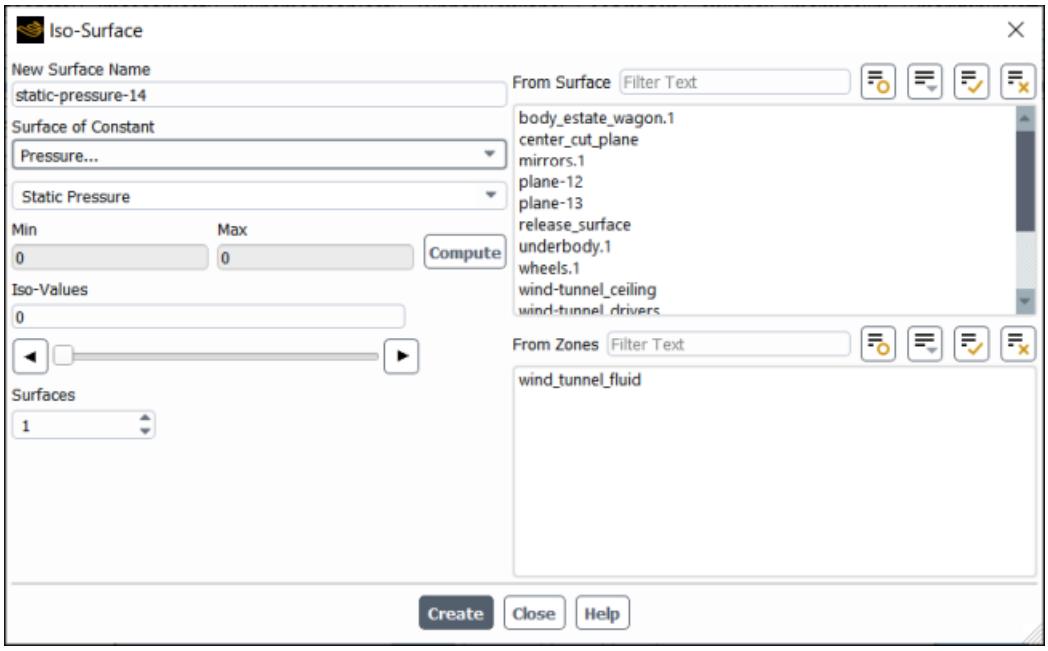
Compute

computes the minimum and maximum values of the scalar field across the domain, and displays them in the **Min** and **Max** boxes.

51.2.63. Iso-Surface Dialog Box

The **Iso-Surface** dialog box allows you to interactively create iso-surfaces. These surfaces can be iso-valued sections of an existing surface or of the entire domain. For more effective use of the slider bar, press the **Compute** button before using it. See Iso-surfaces (p. 3818) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

New Surface Name

designates the name of the surface to be created. The default is the concatenation of the scalar field name and an integer which is the new surface ID.

Surface of Constant

contains a list from which you can select the scalar field which will be used for isosurfacing.

Min

displays the minimum field value, which is computed when you click **Compute**.

Max

displays the maximum field value, which is computed when you click **Compute**.

Compute

computes the minimum and maximum of the scalar field across the domain and displays them in the **Min** and **Max** boxes.

Iso-Values

sets user-specified isovalues. There are two ways you can set the **Iso-Values**:

- You can set an isovalue interactively by moving the slider with the left mouse button. This will also create a temporary isosurface in the graphics window. Using the slider allows you to preview the isosurfaces before defining them. Note: Even though the isosurface is displayed, it is only a temporary surface. To create an isosurface, use the **Create** button after deciding on a particular isovalue.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- You can type in isovalues in the **Iso-Values** field directly, separating multiple values by white space. Multiple isovalues will be contained in a single isosurface; that is, you cannot select subsurfaces within the resulting isosurface.

From Surface

contains a list of existing surfaces from which you can select the surface to be used for isosurfacing. If you do not select a surface from the list, the isosurfacing will be performed on the entire domain.

From Zones

contains a list of cell zones from which you can select the zone for creating an isosurface.

Surfaces

lists the number of surfaces that will be created at once.

Spacing

specifies the distance between surfaces.

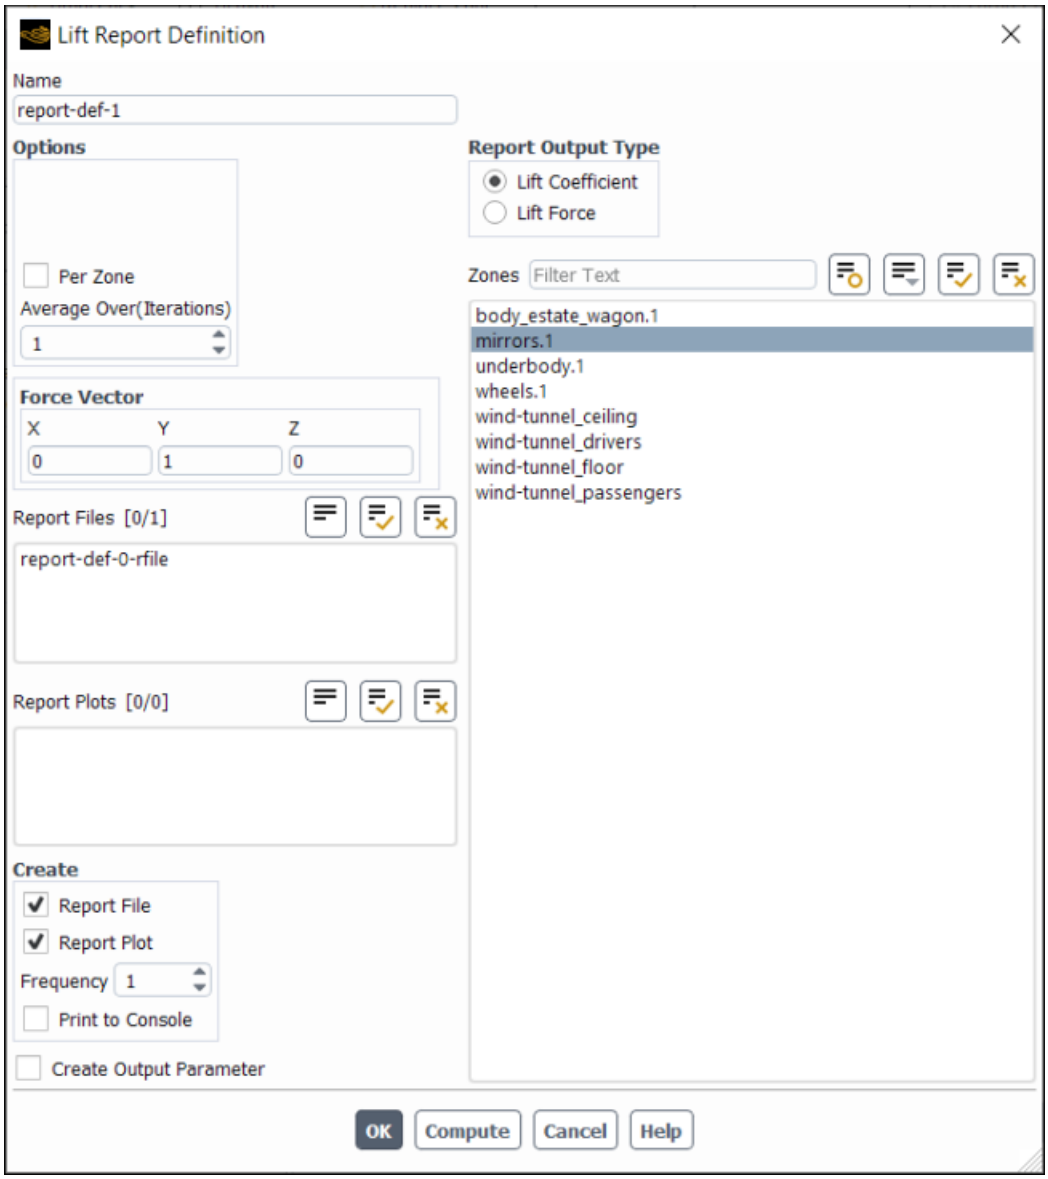
Create

creates the surface(s).

51.2.64. Lift Report Definition Dialog Box

Solution → Reports → Definitions → New → Force Report → Lift...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

Per Zone

specifies whether or not the lift for multiple walls zones should be monitored on each wall zone separately. When this option is turned off (the default), Fluent computes and monitors the total lift for all of the selected walls zones combined together.

Average Over (Time-Steps), Average Over (Iterations)

(optional) To have Fluent calculate a running average for the **Lift Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Force Vector

contains the components of the force vector.

X,Y,Z

are the components of the force vector along which the forces will be computed.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report Output Type

Lift Coefficient

specifies the report definition as a unitless quantity.

Lift Force

specifies that the report definition has units of force.

Zones

lists the zones you can select for lift coefficient or drag lift computation.

OK

creates the report definition.

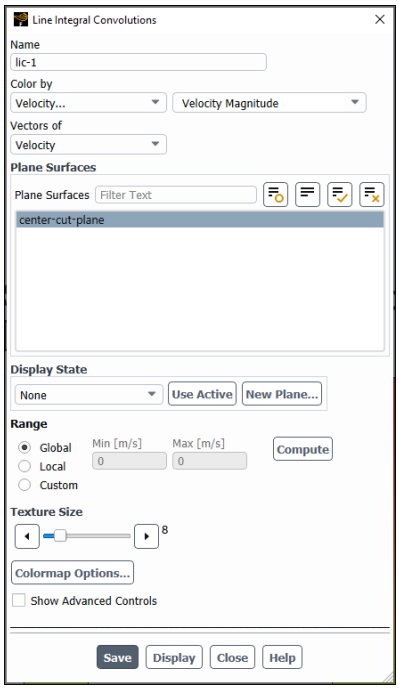
Compute

computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.65. Line Integral Convolutions Dialog Box

Results → Graphics → LICs → New...

The **Line Integral Convolution** dialog box allows you to create a line integral convolutions (LIC) plot. Refer to Displaying Line Integral Convolutions (LICs) (p. 3905) for additional information.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

designates the name of the LICs plot.

Color by

drop-down lists for the category and field variable used to color the plot.

Vectors of

drop-down list specifying whether the vectors represent velocity or relative velocity.

Phase

(Multiphase only) specifies the phase that the colors apply to.

Vectors of

contains a list from which you can select the vector field to be plotted.

Phase

(Multiphase only) specifies the phase for the velocity or relative velocity vectors.

Plane Surfaces

list of planar surfaces available for displaying the LICs plot.

Display State

specifies the display state that is associated with this graphics object.

drop-down list of display states

selectable list of all the existing display states associated with this case.

Use Active

creates a display state that matches the settings of the active graphics window and assigns it to this graphics object (this association is only saved after you click **Save/Display**).

New Plane...

opens the Plane Surface Dialog Box in the *Fluent User's Guide* (p. 5523).

Range

specifies how the range is computed.

Global

indicates that the range is computed based on the entire domain.

Local

indicates that the range is computed based on the selected surface(s).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Custom

allows you to manually specify the **Min** and **Max** fields.

Compute

computes the minimum and maximum values of the field variable coloring the LICs. If **Global** is selected, the range is computed based on the entire domain, if **Local** is selected, the range is computed based on the selected surface(s).

Texture Size

controls the size (in 100's of pixels) of the texture image used in the convolution.

Colormap Options...

opens the Colormap Dialog Box in the *Fluent User's Guide* (p. 5226), allowing you to customize the colormap for this graphics object.

Show Advanced Options

exposes additional advanced controls.

Intensity Factor

scales the intensity levels of the convolution results up or down. You can use this to control the brightness or contrast of the resulting image.

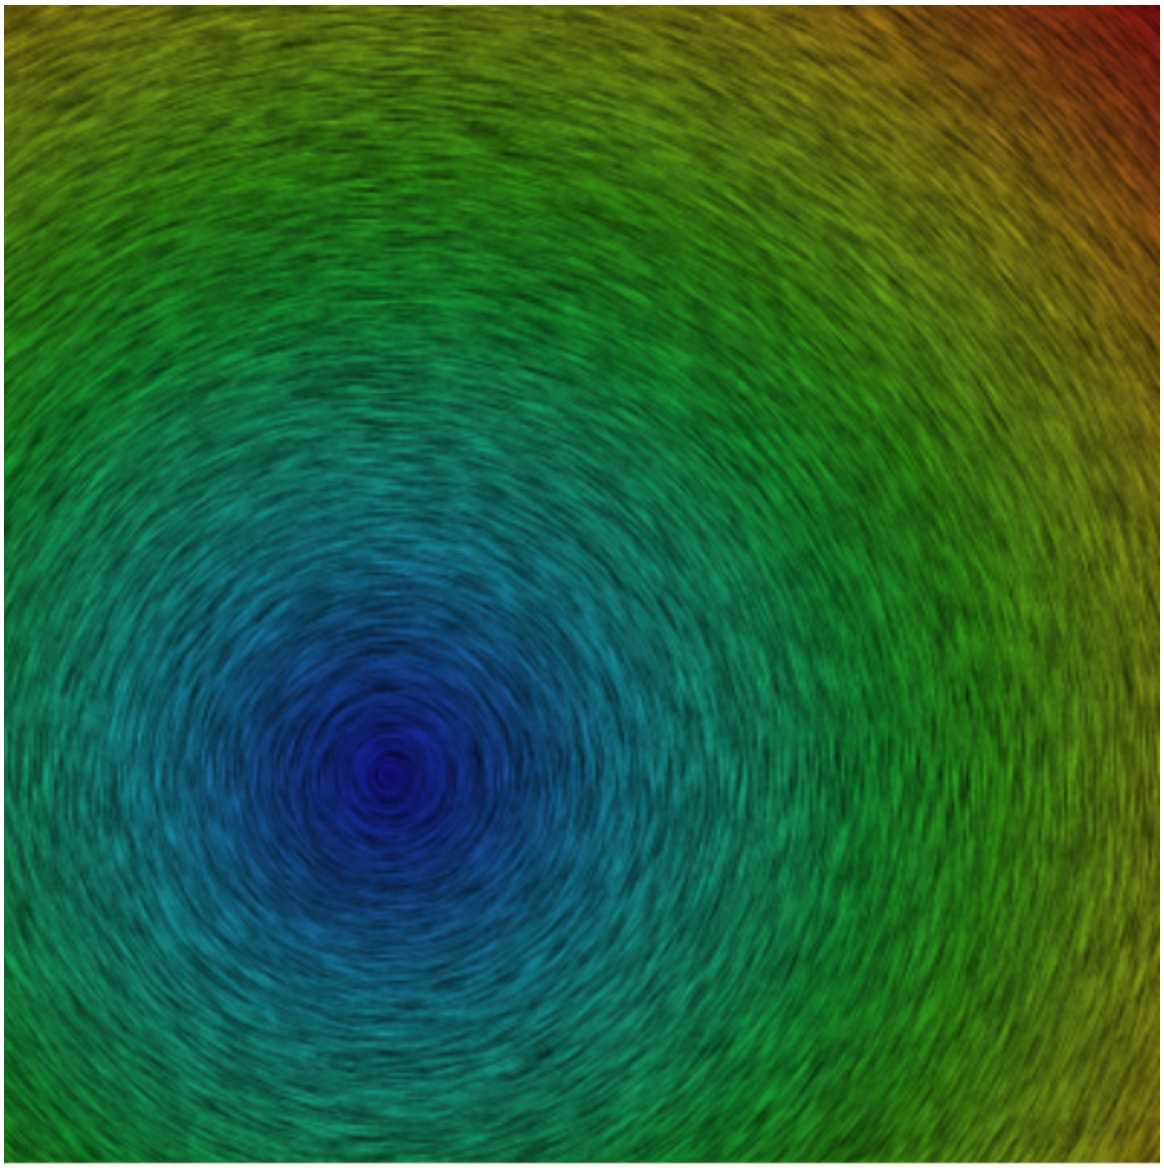
Image Filter

applies an image filter to the convolutions.

- **None**—no filter applied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

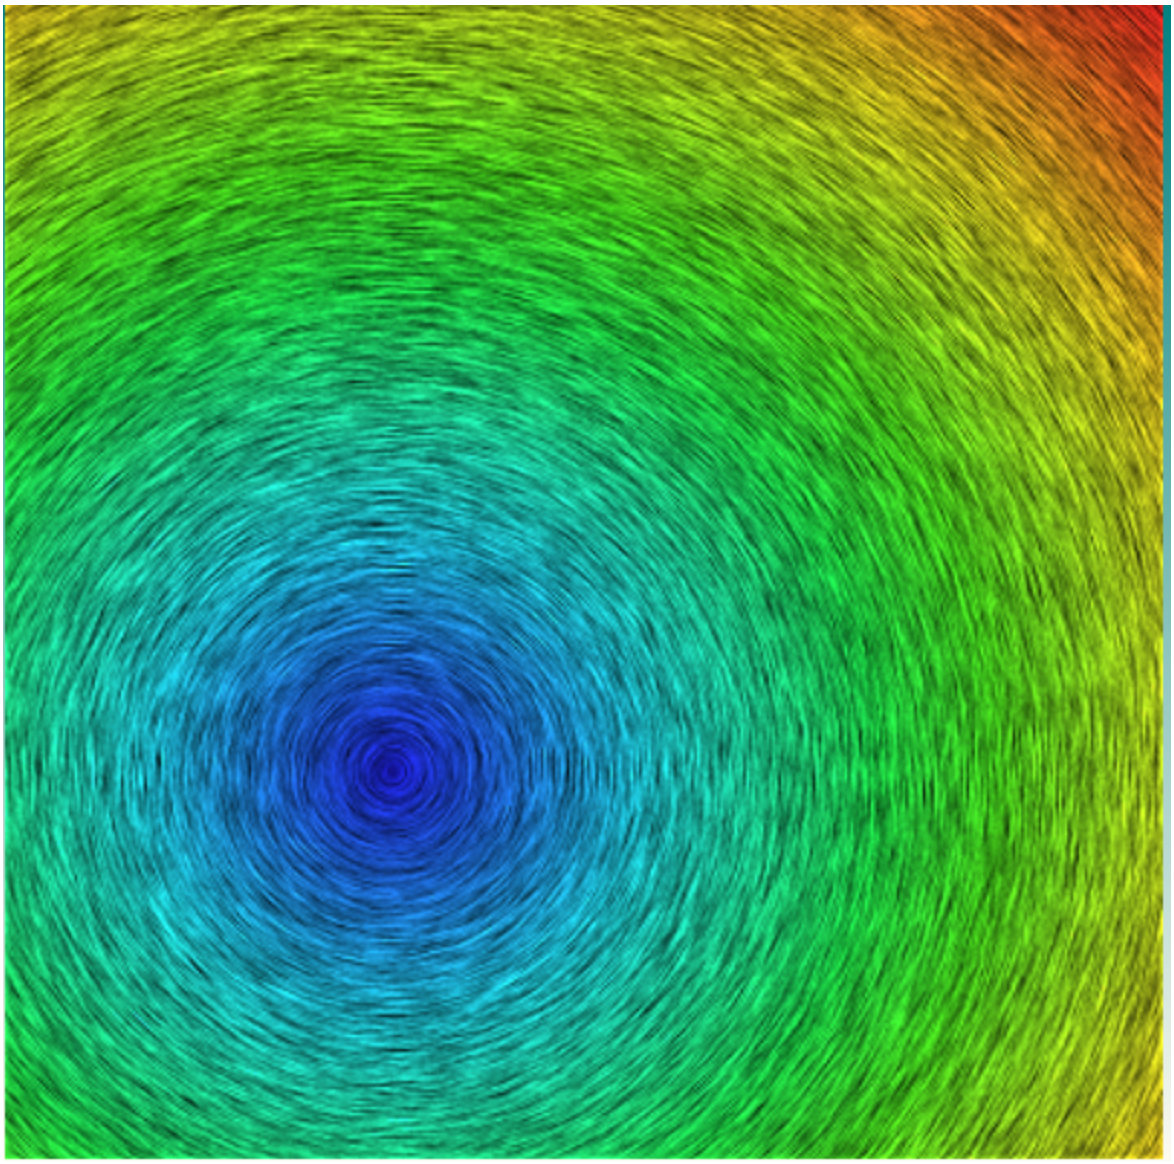
Figure 51.1: Example with the Image Filter Set to None



- **Mild Sharpen**—provides a mild increase in the focus or contrast of the texture image.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

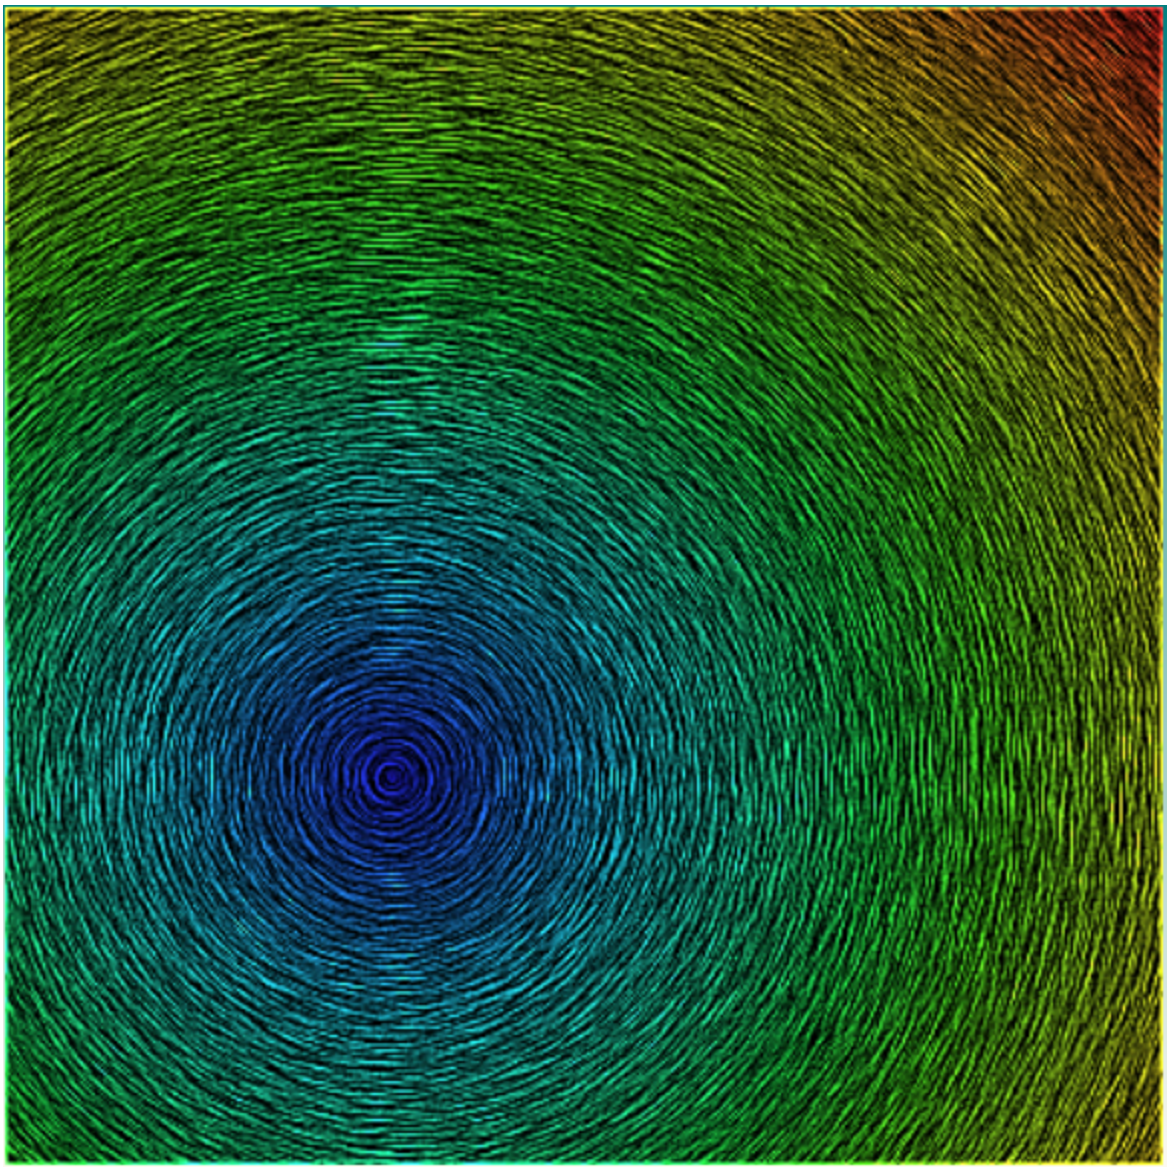
Figure 51.2: Example with the Image Filter Set to Mild Sharpen



- **Strong Sharpen**—provides a stronger increase in the focus or contrast of the texture image.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

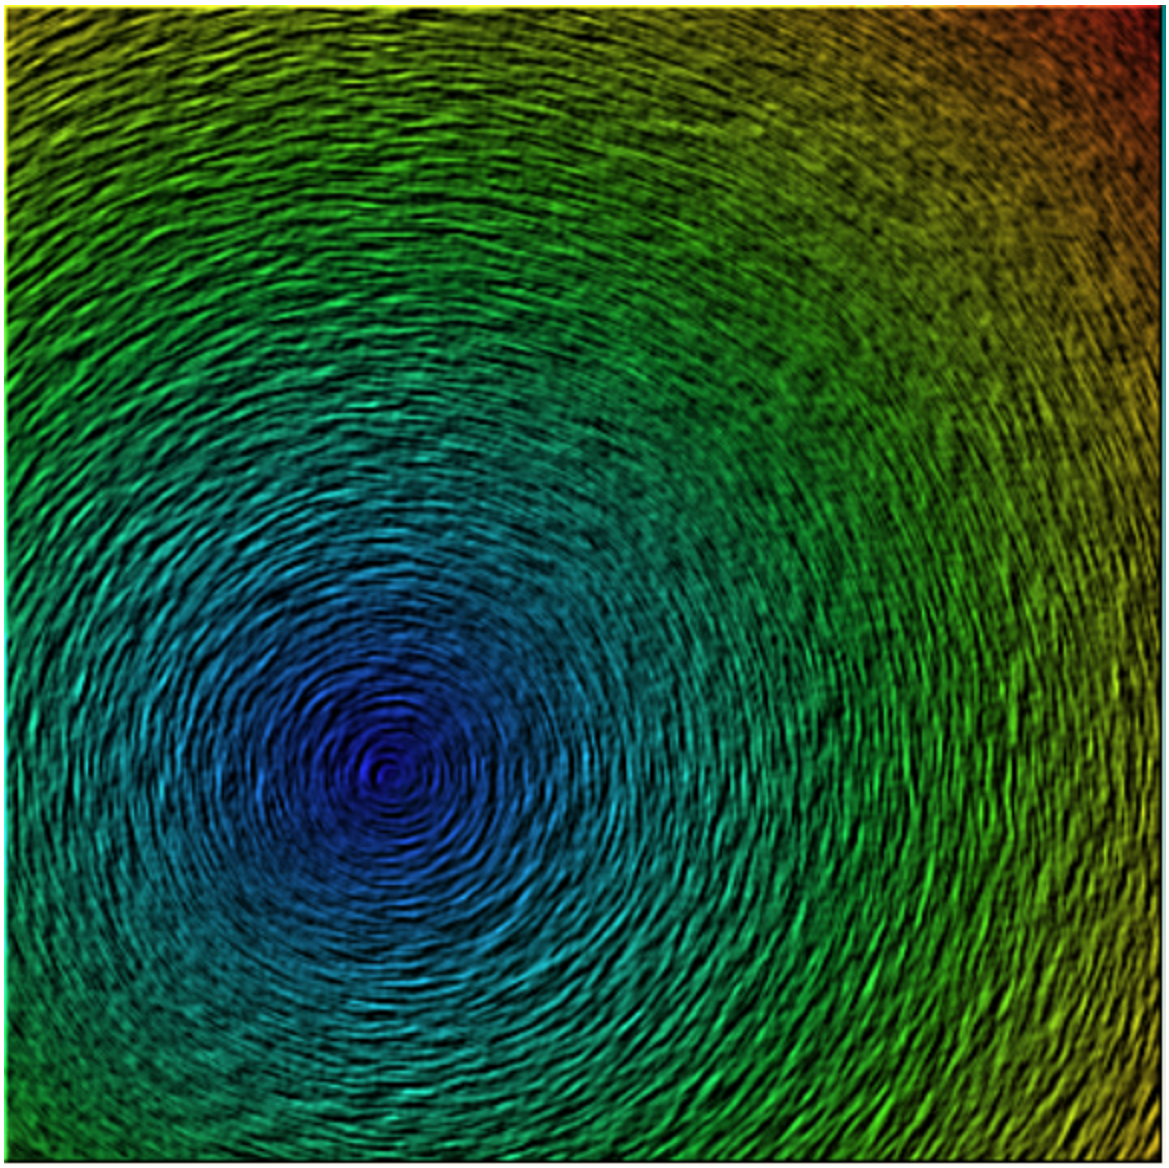
Figure 51.3: Example with the Image Filter Set to Strong Sharpen



- **Mild Emboss**—creates shadowing and highlights to give edges a raised effect on features in the image.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

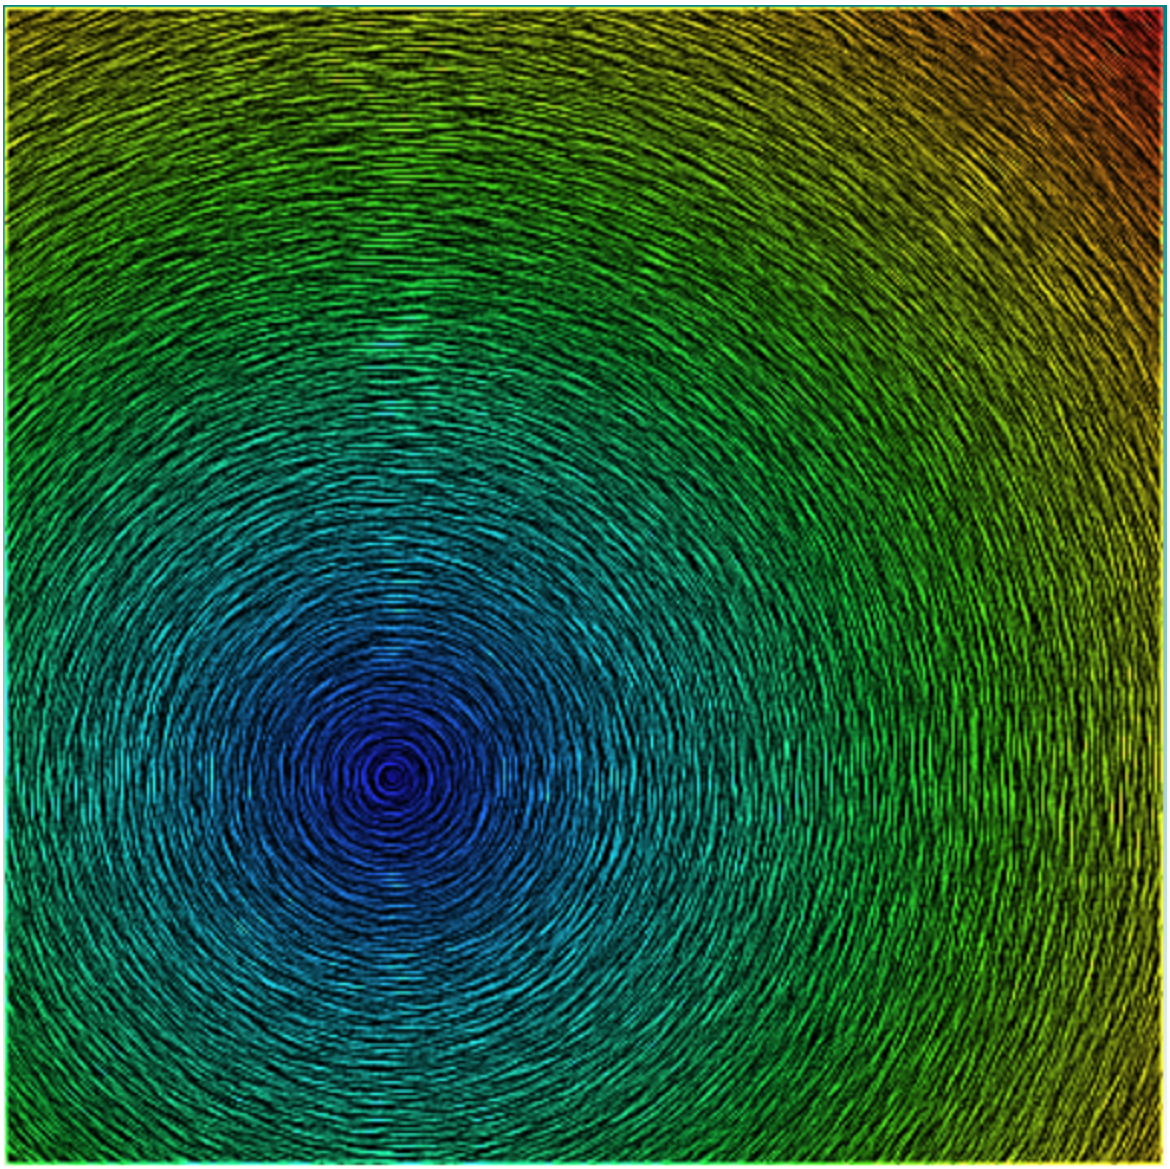
Figure 51.4: Example with the Image Filter Set to Mild Emboss



- **Strong Emboss**—a stronger version of the **Mild Emboss** option. This will also result in the loss of color in areas with little definition before the filter was applied.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 51.5: Example with the Image Filter Set to Strong Emboss



Normalize

normalizes the vector field magnitude during the integration. The effectiveness of the convolution can be very sensitive to the vector field magnitude, so normalization is typically done to maintain a clear definition of the flow field and in particular, the location of singularities.

Save

saves the settings of the plot as they currently appear in the dialog box.

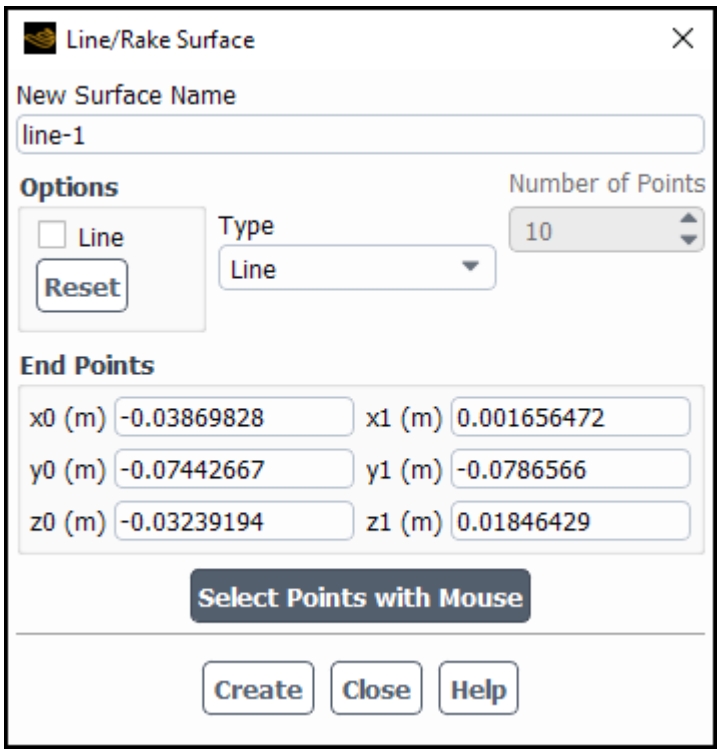
Display

displays a plot with the settings shown in the dialog box. *Note that this button does not save the settings, so if you modify settings and display the updated plot, you must click* ***Save*** *to preserve these settings before closing the dialog box.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.66. Line/Rake Surface Dialog Box

The **Line/Rake Surface** dialog box allows you to interactively create line and rake surfaces. A rake is a linear, uniform distribution of points between two endpoints. See Line and Rake Surfaces (p. 3806) for details about the items below.



Controls

Options

contains options related to the line tool. See Using the Line Tool (p. 3808) for details about using this feature.

Line Tool

enables the line tool.

Reset

resets the line tool to its default position.

Type

selects line or rake as the surface to be created.

Number of Points

defines the number of points in the rake surface (inactive for line surfaces).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

End Points

designates the coordinates of the first point (**x0**, **y0**, **z0**) and the last point (**x1**, **y1**, **z1**).

Select Points with Mouse

allows you to select endpoints with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See Controlling the Mouse Button Functions (p. 3989) for information about setting mouse button functions.)

New Surface Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

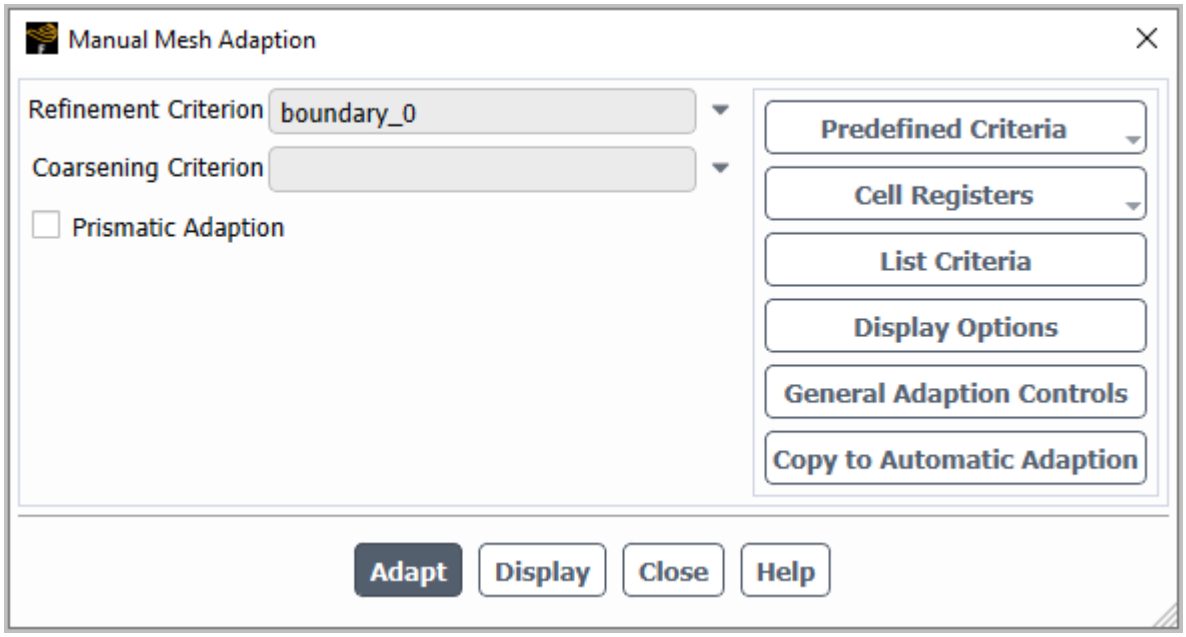
Create

creates the surface.

51.2.67. Manual Mesh Adaption Dialog Box

The **Manual Mesh Adaption** dialog box allows you to manually adapt your mesh. See Refining and Coarsening (p. 3759) for details.

Domain → Adapt → Manual...



Controls

Refinement Criterion

specifies the cell register or expression that Fluent will use during the calculation to determine which cells to refine.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Coarsening Criterion

specifies the cell register or expression that Fluent will use during the calculation to determine which cells to coarsen.

Prismatic Adaption

specifies that prismatic cells are adapted anisotropically. This option is only available with the PUMA adaption method.

Predefined Criteria

allows you to select from a list of commonly used criteria for adapting the mesh (for a description of the list, see Predefined Criteria for Adaption (p. 3766)); if one is selected, Fluent will automatically generate the necessary cell registers and/or expressions for refinement and coarsening, and define the settings in the **Manual Mesh Adaption** dialog box and General Adaption Controls Dialog Box (p. 5430) accordingly. Depending on your selection, you may be prompted to complete the setup by defining fields in the Adaption Criteria Settings Dialog Box (p. 5333).

Cell Registers

allows you to create new cell registers and manage existing ones, which may then be selected from the **Refinement Criterion** and/or **Coarsening Criterion** drop-down lists.

List Criteria

prints to the console the number of cells marked for refinement, the number of cells marked for coarsening, and the number marked for both operations.

Display Options

opens the Display Options - Adaption Dialog Box (p. 5379).

General Adaption Controls

opens the General Adaption Controls Dialog Box (p. 5430), where you can specify the general settings that Fluent uses when adapting the mesh.

Copy to Automatic Adaption

copies the settings to the Automatic Mesh Adaption Dialog Box (p. 5348), where you can create adaption criteria which can be applied during the solution.

Adapt

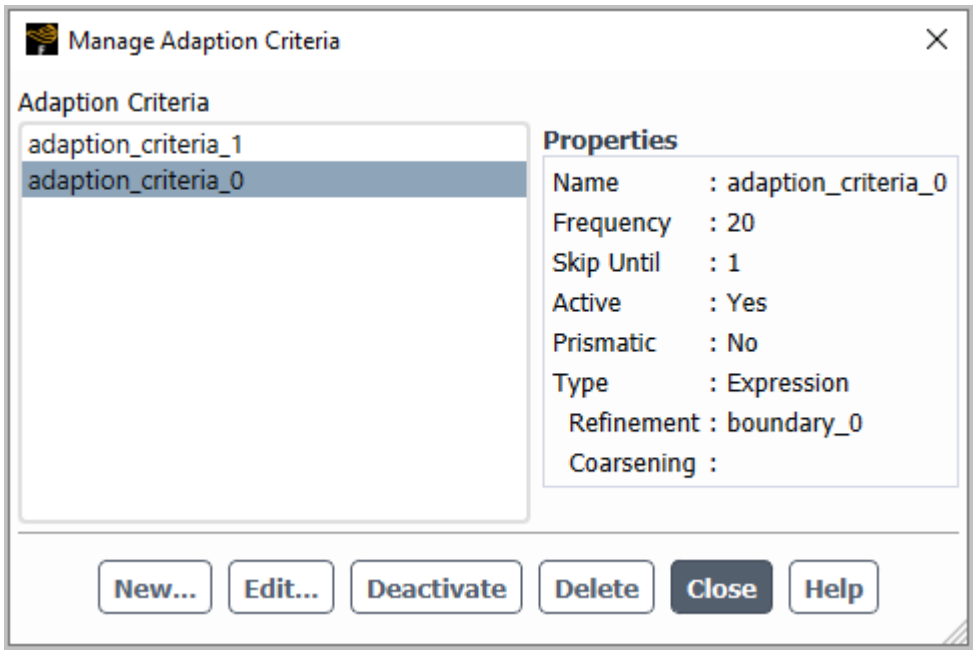
performs adaption based on the settings in this dialog box.

51.2.68. Manage Adaption Criteria Dialog Box

The **Manage Adaption Criteria** dialog box allows you to manage criteria for automatic mesh adaption. See Refining and Coarsening (p. 3759) for details.

Domain → **Adapt** → **Manage...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Adaption Criteria

lists the defined criteria for automatic adaption during a calculation.

Properties

displays information about the criterion selected in the **Adaption Criteria** list.

New...

opens the Automatic Mesh Adaption Dialog Box (p. 5348), where you can create new automatic adaption criteria.

Edit...

opens the Automatic Mesh Adaption Dialog Box (p. 5348), where you can edit the criterion selected in the **Adaption Criteria** list.

Deactivate

deactivates the criterion selected in the **Adaption Criteria** list, so that it is not applied during the calculation.

Activate

activates the criterion selected in the **Adaption Criteria** list, so that it is applied during the calculation.

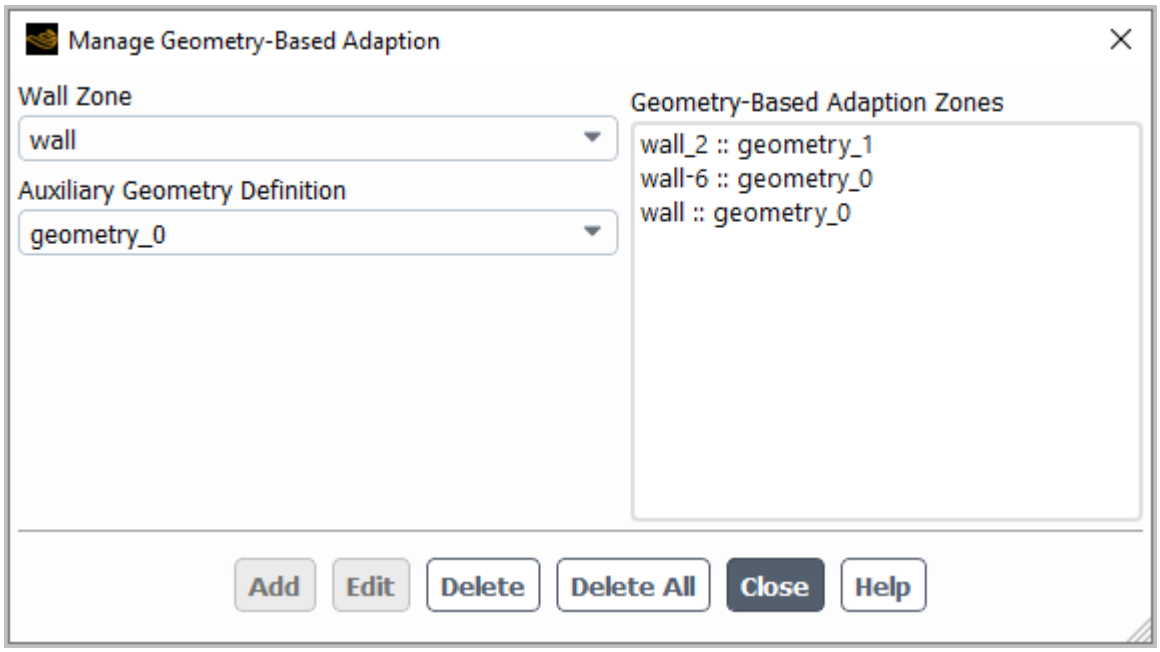
Delete

deletes the criterion selected in the **Adaption Criteria** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.69. Manage Geometry-Based Adaption Dialog Box

The **Manage Geometry-Based Adaption** dialog box allows you to manage definitions for geometry-based adaption with the PUMA adaption method. It is opened by clicking the **Manage...** button under the **Show Advanced Controls** option in the General Adaption Controls Dialog Box (p. 5430). See Refining and Coarsening (p. 3759) for details.



Controls

Wall Zone

allows you to select the wall zone to which you want geometry-based adaption applied.

Auxiliary Geometry Definition

allows you to select the auxiliary geometry definition to which you want the selected **Wall Zone** to conform. For details on creating auxiliary geometry definitions, see Managing Auxiliary Geometry Definitions (p. 1759).

Geometry-Based Adaption Zones

lists the pairings of wall zones and auxiliary geometry definitions that you have created through the **Add** button. You can make a single selection from this list and click the **Delete** button if you want delete the pairing.

Add

creates a pairing (listed under **Geometry-Based Adaption Zones**) of the selected **Wall Zone** and **Auxiliary Geometry Definition**.

Edit

allows you to revise which **Auxiliary Geometry Definition** is paired with a given **Wall Zone**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

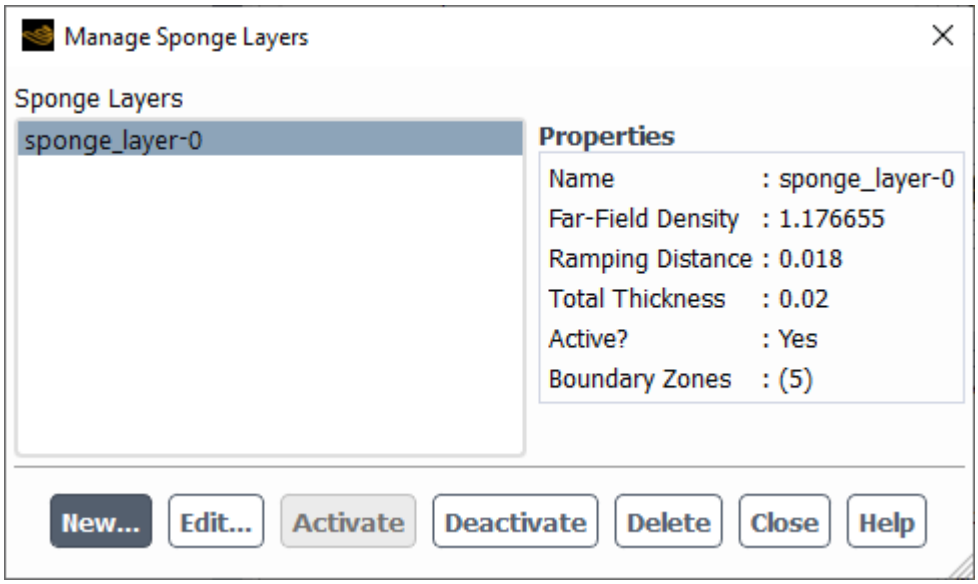
deletes the selected pairing under **Geometry-Based Adaption Zones**.

Delete All

deletes all of the pairings under **Geometry-Based Adaption Zones**.

51.2.70. Manage Sponge Layers Dialog Box

The **Manage Sponge Layers** dialog box allows you to define sponge layers at boundary zones (so that the density is blended from the value calculated by the solver to user-specified far-field values), in order to eliminate non-physical pressure wave reflections from boundary zones in transient simulations of compressible flows with the pressure-based solver. For further details, see Sponge Layers (p. 2665).



Controls

Sponge Layers

lists the existing sponge layer definitions.

Properties

lists the properties of the selected sponge layer in the **Sponge Layers** list. *This list is blank when a sponge layer is not selected.*

New...

opens the Sponge Layer Dialog Box (p. 5564), allowing you to create a new sponge layer definition, which by default is active.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edit...

opens the Sponge Layer Dialog Box (p. 5564), allowing you to edit the definition selected in the **Sponge Layers** list.

Activate

activates the selection in the **Sponge Layers** list, so that it is used when the calculation is run.

Deactivate

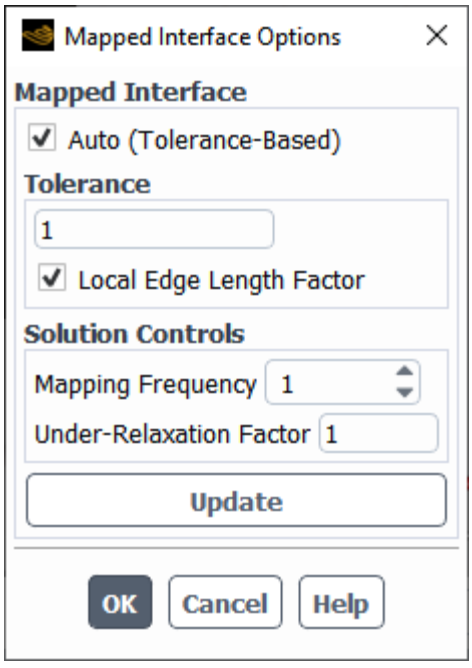
deactivates the selection in the **Sponge Layers** list, so that it is not used when the calculation is run.

Delete

deletes the definition that is selected in the **Sponge Layers** list.

51.2.71. Mapped Interface Options Dialog Box

The **Mapped Interface Options** dialog box allows you to update which mesh interfaces use the mapped option and the related settings (see The Mapped Option (p. 1157) for additional information). It is opened by selecting a many-to-many mesh interface and clicking the **Options...** button in the **Mesh Interfaces** group box of the Mesh Interfaces Dialog Box (p. 5468).



Controls

Mapped Interface

contains options related to mapped interface specification.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Auto (Tolerance-Based)

specifies that all mesh interfaces that have interface zones that penetrate each other are automatically defined as **Mapped** interfaces (provided that at least one side of each interface consists only of solid zones).

Tolerance

Local Edge Length Factor

(when enabled) allows you to specify the multiplier that Fluent uses with the smallest edge length of the interface zones to calculate the tolerance for mapping. Disabling **Local Edge Length Factor** allows you to specify an absolute value for the tolerance. Note that this does not overwrite any locally specified tolerance in the **Edit Mesh Interfaces** dialog box.

Solution Controls

Mapping Frequency

specifies how often calculation values are interpolated across mapped interfaces.

Under-Relaxation Factor

allows you to reduce the rate of change per iteration of physical quantities across mapped interfaces to aid with convergence. For additional information on setting under-relaxation factors, see Setting Under-Relaxation Factors (p. 3575).

Update

applies the selection(s) made in the **Mapped Interface Options** dialog box. This button is grayed out until you make enable / disable the **Auto (Tolerance-Based)** option; it also returns to being grayed out once it is clicked.

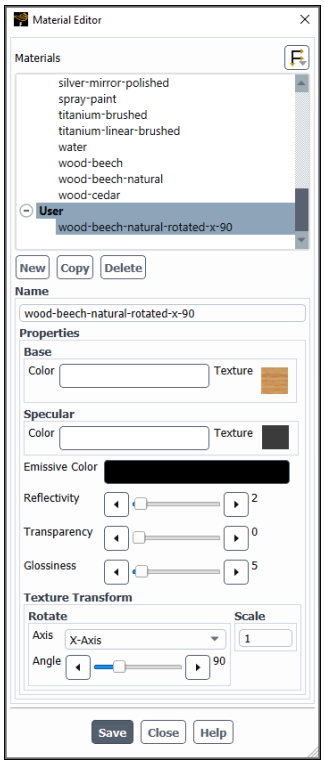
Note:

Enabling the **Auto (Tolerance-Based)** option and clicking **Update** applies these selections globally for all relevant interfaces. Once you click **Update** you can return to the **Mesh Interfaces** dialog box to modify local settings for individual interfaces.

51.2.72. Material Editor Dialog Box

The **Material Editor** dialog box allows you create new materials for realistic rendering. *Refer to Creating Custom Realistic Materials (p. 3867) for additional information on using the **Material Editor** dialog box.*

View → **Graphics** → **Material Editor...**



Controls

Materials

lists the available realistic materials.

New

creates a new material with default properties.

Copy

creates a new material with the properties of the selected **Material**.

Delete

removes the material from the **Materials** list and from any mesh objects referencing that material. *You can only delete user-defined materials; the default materials cannot be deleted.*

Properties

lists the editable properties that define the material's appearance.

Base Color

specifies the bulk color of the material. **Texture** is a non-editable field that indicates the base texture associated with the material, if there is one. *You can hover over the texture image to see an enlarged picture of the texture.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Specular Color

specifies the highlight color seen due to lighting effects. **Texture** is a non-editable field that indicates the specular texture associated with the material, if there is one. *You can hover over the texture image to see an enlarged picture of the texture.*

Emissive Color

specifies the color emitted from the material.

Reflectivity

specifies how reflective the material appears.

Transparency

specifies how transparent the material appears.

Glossiness

specifies how glossy the material appears.

Texture Transform

provides options for modifying the appearance of the material texture.

Rotate

controls the orientation of the texture.

Axis

specifies the axis the texture will be rotated about.

Angle

controls the angle (in degrees) that the texture is rotated about the selected axis.

Scale

controls the scaling of the texture. A larger value increases the texture scaling, similarly to zooming in on the texture. *Valid inputs are in the range 0.0004 to 4.*

Save

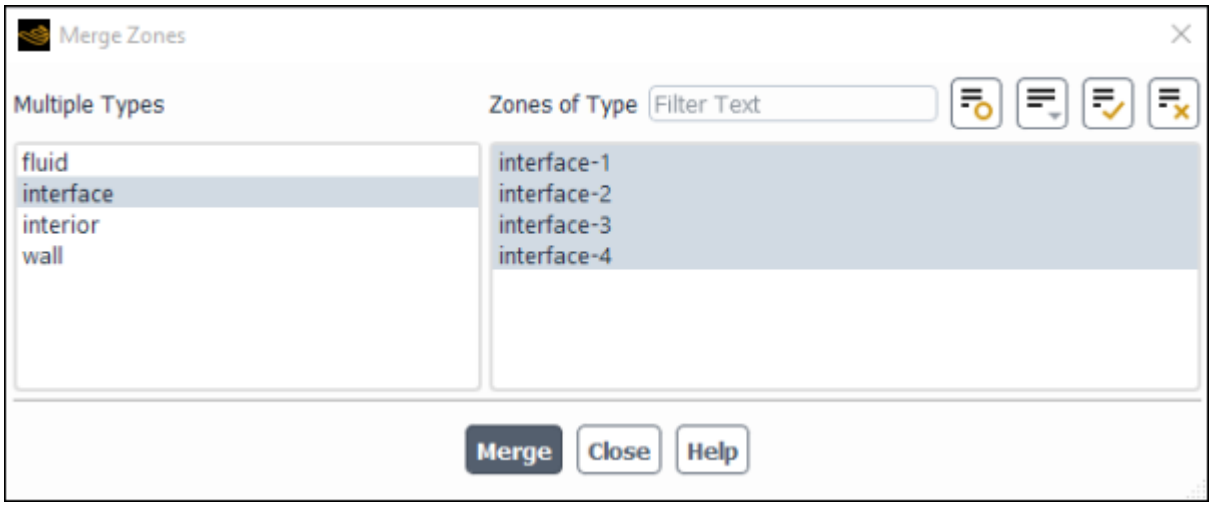
saves the current settings of any custom material.

51.2.73. Merge Zones Dialog Box

The **Merge Zones** dialog box allows you to merge multiple zones of the same type into a single zone. See Merging Zones (p. 1238) for details.

Domain → Zones → Combine → Merge...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Multiple Types

contains a selectable list of the zone types for which you can merge multiple zones. You select a type and the corresponding zones of that type will be displayed in the **Zones of Type** list.

Zones of Type

contains a list from which you can select two or more zones to be merged into a single zone. The zones are of the type selected in the **Multiple Types** list.

Merge

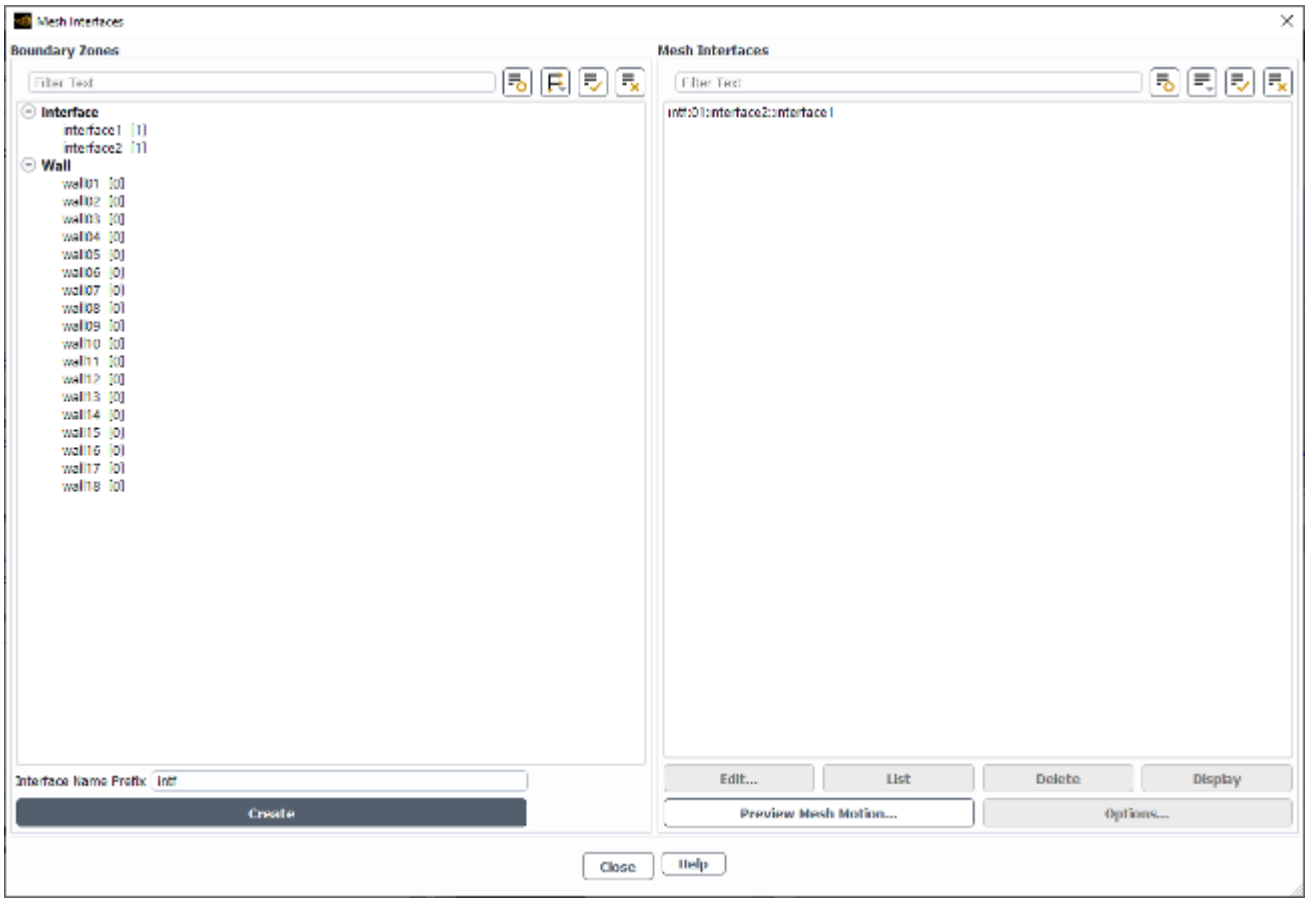
merges the selected zones into a single zone. If your case file has dynamic zones or mesh interfaces, the Warning Dialog Box (p. 5604) will open and require your input prior to the merge.

51.2.74. Mesh Interfaces Dialog Box

The **Mesh Interfaces** dialog box allows you to automatically or manually create mesh interfaces for use with sliding meshes (see Using Sliding Meshes (p. 1772)) or multiple reference frames (see Mesh Setup for a Multiple Moving Reference Frame (p. 1753)), or for meshes with non-conformal boundaries (see Non-Conformal Meshes (p. 1149)). For information about using this dialog box, see Using a Non-Conformal Mesh in Ansys Fluent (p. 1164).

Domain → Interfaces → Mesh...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Boundary Zones

allows you to create new mesh interfaces using the automatic or manual method. Note that the selection list at the top of the group box (which lists the boundary zones available for selection, along with a number that indicates the number of mesh interfaces that zone is a part of) is only used as part of the automatic method; when a selection is made, the **Mesh Interfaces** of which it is a part are also highlighted.

Interface Name Prefix

specifies the prefix used in the names of all the mesh interfaces created automatically through the **Create** button.

Options...

opens the Interface Creation Options Dialog Box (p. 5442), so you can define settings that you want applied to the mesh interfaces that are created automatically through the **Create** button. This button is only available if you have disabled the default one-to-one interface creation method by using the `define/mesh-interfaces/one-to-one-pairing?` text command.

Create

creates mesh interfaces using the automatic method, so that Fluent is responsible for determining which of the selected **Boundary Zones** can be grouped together to form the two sides

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

of one or more mesh interfaces. Note that mesh interfaces that use the periodic or periodic repeats option cannot be created using this button, but must instead be created through the **Manual Create...** button.

Manual Create...

opens the Create/Edit Mesh Interfaces Dialog Box (p. 5363), so you can create mesh interfaces using the manual method. Note that the manual method is only necessary for mesh interfaces that use the periodic or periodic repeats option. This button is only available if you have disabled the default one-to-one interface creation method by using the `define/mesh-interfaces/one-to-one-pairing?` text command.

Turbo Create...

opens the Create/Edit Turbo Interfaces Dialog Box (p. 5367), so you can create turbo interfaces. This button is only available if you have disabled the default one-to-one interface creation method by using the `define/mesh-interfaces/one-to-one-pairing?` text command or, before creating any one-to-one mesh interfaces, by enabling the **Enable** option in the **Turbo Model** group of the **Domain** ribbon tab.

Mesh Interfaces

allows you to manage existing mesh interfaces. Note that many of the buttons in this group box are not accessible unless you make a selection from the list at the top. This list enumerates the mesh interfaces that have been created; when a selection is made, the **Boundary Zones** that comprise it are also highlighted.

Edit...

opens the **Edit Mesh Interface** dialog box or (for a many-to-many mesh interface) the Edit Mesh Interfaces Dialog Box (p. 5398), so you can edit the name or (for a many-to-many mesh interface) the name, list of interface zones assigned to the interface, and/or interface options.

List

prints information about the selected mesh interface(s) in the console.

Delete

deletes the selected mesh interfaces.

Display

allows you to display the selected mesh interface in the graphics window. Note that after you have selected a mesh interface, you can modify what zones are displayed by selecting / deselecting zones in the **Boundary Zones** list.

Preview Mesh Motion...

opens the Mesh Motion Dialog Box (p. 5097).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options...

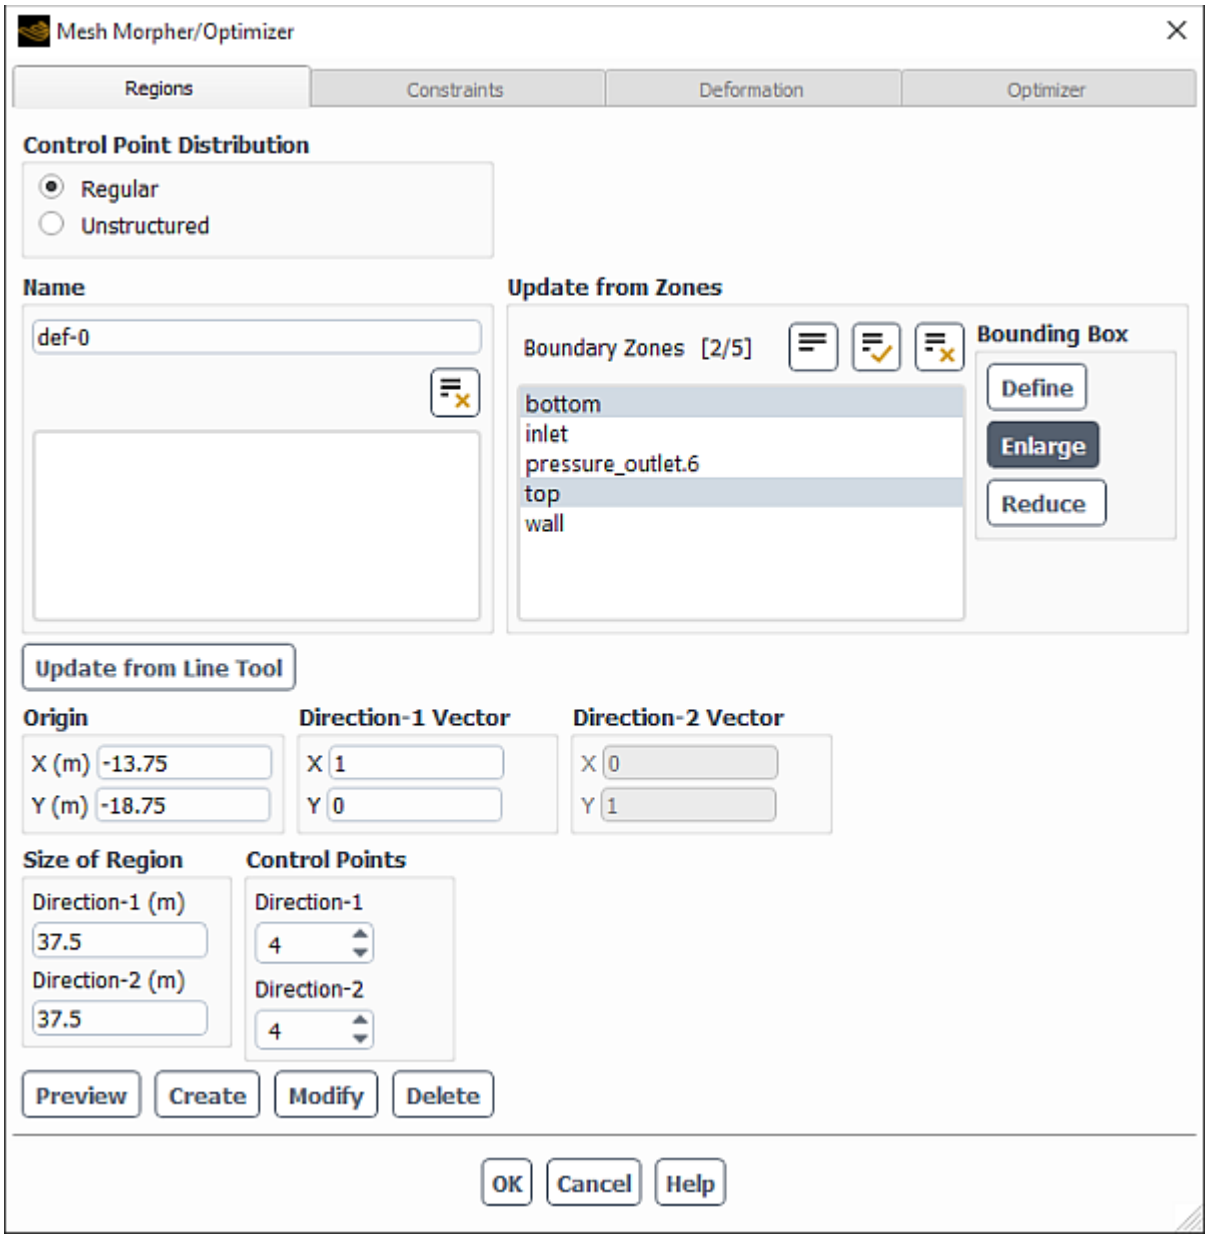
opens the Mapped Interface Options Dialog Box (p. 5464), where you can update which mesh interfaces use the mapped option and set global parameters for the mapped mesh interfaces. This button is only available if you selected a many-to-many mesh interface from the selection list in the **Mesh Interfaces** group box.

51.2.75. Mesh Morpher/Optimizer Dialog Box

The **Mesh Morpher/Optimizer** dialog box allows you to use the mesh morpher/optimizer to deform the mesh in order to solve shape optimization problems. You can deform the mesh manually, allow a built-in optimizer to define the deformation in order to minimize an objective function, or use Design Exploration in Ansys Workbench to easily explore a variety of deformation scenarios. See Using the Mesh Morpher/Optimizer (p. 4568) for further details.

Design → **Parameter-Based** → **Optimizer...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Regions

tab allows you to define the regions of the domain where the mesh will be deformed in order to optimize the shape.

Control Point Distribution

allows you to select the way in which you will define the locations of the control points, as well as the kinds of motions you can apply.

Regular

specifies that the control points will be spread in a regular distribution throughout the entire deformation region. The number of control points along each of the defining direc-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

tion vectors will be specified in the **Control Points** group box. The motion of the control points will be limited to translations, as the ability to define rotational or radial motions will not be available.

Unstructured

specifies that control point locations will be specified by right-clicking with the mouse on boundary zones, distributing an approximate number throughout a zone, or by entering coordinates, using the Define Control Points Dialog Box (p. 5376). The motion of the control points will be able to be defined as translations, as rotations about a point / axis, or radially about a point / axis.

Name

provides controls for the deformation regions you are defining. The upper text-entry box defines the name of the region that is created when you click the **Create** button. The lower selection list allows you to select a region that has already been created, in order to display it in the graphics window, modify the settings via the **Modify** button, or delete the region via the **Delete** button.

Update from Zones

allows you to create a bounding box that defines the deformation region.

Boundary Zones

specifies the boundary zones that will be used to generate a bounding box for the deformation region when you click the **Define** button.

Define

updates the values in the **Origin**, **Direction-1 Vector**, **Direction-2 Vector**, and **Size of Region** group boxes based on a bounding box that encompasses the selections in the **Boundary Zones** list, and previews the bounding box in green in the graphics window.

Enlarge

increases the size of the bounding box created by the **Define** button, and previews the revised bounding box in green in the graphics window.

Reduce

decreases the size of the bounding box created by the **Define** button, and previews the revised bounding box in green in the graphics window.

Update from Plane Tool

updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the plane tool. See Using the Plane Tool (p. 3813) for information about the plane tool. This button is only available for 3D cases.

Open the Plane Surface Dialog Box (p. 5523) to make the plane tool appear.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Update from Line Tool

updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the line tool. See Using the Line Tool (p. 3808) for information about the line tool. This button is only available for 2D cases.

Open the Line/Rake Surface Dialog Box (p. 5458) to make the line tool appear.

Origin

allows you to define the Cartesian coordinates of the origin of the deformation region.

X

defines the *x* coordinate of the origin of the deformation region.

Y

defines the *y* coordinate of the origin of the deformation region.

Z

defines the *z* coordinate of the origin of the deformation region. This number-entry box is only available for 3D cases.

Direction-1 Vector

allows you to define a vector that acts as the first direction of the deformation region relative to the **Origin**.

X

defines the *x* component of the first direction vector of the deformation region.

Y

defines the *y* component of the first direction vector of the deformation region.

Z

defines the *z* component of the first direction vector of the deformation region. This number-entry box is only available for 3D cases.

Direction-2 Vector

defines a vector that is used to calculate the second direction of the deformation region relative to the **Origin**. For 2D cases, the values in the **Direction-2 Vector** group box are automatically defined by Ansys Fluent to be perpendicular to the **Direction-1 Vector**. For 3D cases, the vector defined by the **Direction-2 Vector** group box is projected onto a plane that intersects the **Origin** and is perpendicular to the vector defined in the **Direction-1 Vector** group box, in order to calculate the second direction.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X

defines the *x* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

Y

defines the *y* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

Z

defines the *z* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only available for 3D cases.

Size of Region

allows you to define the overall dimensions of the deformation region.

Direction-1

defines the length of the deformation region along the direction specified by the **Direction-1 Vector** group box.

Direction-2

defines the length of the deformation region along the direction specified by the **Direction-2 Vector** group box.

Direction-3

defines the length of the deformation region along the third axis (that is, the cross product of the vectors defined by the **Direction-1 Vector** and **Direction-2 Vector** group boxes). This number-entry box is only available for 3D cases.

Boundary Continuity

allows you to specify whether the mesh transitions are smooth or abrupt wherever the mesh intersects with the limits of the deformation region. This group box is only available when **Unstructured** is selected from the **Control Point Distribution** list.

Smooth Transitions

enables smooth mesh transitions wherever the mesh intersects with the limits of the deformation region, based on the creation of stationary control points at those intersections.

Display Control Points

displays the stationary control points created when the **Smooth Transitions** option is enabled.

Control Points

allows you to define the control points for the deformation regions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction-1

defines the number of control points for the deformation region selected in the **Name** group box along the direction specified by the **Direction-1 Vector** group box. This number-entry box is only available when **Regular** is selected from the **Control Point Distribution** list.

Direction-2

defines the number of control points for the deformation region selected in the **Name** group box along the direction specified by the **Direction-2 Vector** group box. This number-entry box is only available when **Regular** is selected from the **Control Point Distribution** list.

Direction-3

defines the number of control points for the deformation region selected in the **Name** group box along the third axis (that is, the cross product of the vectors defined by the **Direction-1 Vector** and **Direction-2 Vector** group boxes). This number-entry box is only available for 3D cases when **Regular** is selected from the **Control Point Distribution** list.

Define...

opens the Define Control Points Dialog Box (p. 5376), which you can use to define the control points. This button is only available when **Unstructured** is selected from the **Control Point Distribution** list.

Preview

displays (in green) the bounding box that results from the current settings in the **Origin**, **Direction-1 Vector**, **Direction-2 Vector**, and **Size of Region** group boxes.

Create

creates a new deformation region with the name specified in the upper text-entry box of the **Name** group box and with the settings defined using the **Origin**, **Direction-1 Vector**, **Direction-2 Vector**, **Size of Region**, and (for regular control point distributions) **Control Points** group boxes. The newly created deformation region will be added to and selected in the lower **Name** selection list, and will be displayed (in blue) in the graphics window.

Modify

modifies the saved settings for the deformation region selected in the lower **Name** selection list and displays the modified region in the graphics window.

Delete

deletes the deformation region selected in the lower **Name** selection list.

Constraints

tab allows you to define the constraints on the boundary zones, in order to limit the freedom of particular zones that fall within the deformation region(s) during the morphing of the mesh.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zones

allows you to select the boundary zones for which you are defining a constraint.

Option

specifies the constraint on the boundary zones selected from the **Zones** list.

Unconstrained

specifies that the boundary zones are completely free to be deformed according to the assigned parameters.

Passive

specifies that the nodes of the boundary zones are partially constrained to varying degrees, based on their proximity to adjacent boundary zones that are fixed. The nodes in a passive boundary zone behave in a similar manner to the interior mesh nodes, in order to ensure that there is a smooth transition between fixed and unconstrained boundary zones.

Fixed

specifies that the boundary zones are fixed and will not be deformed.

Display

displays the selected **Zones** in the graphics window.

Summary

prints a list in the console that summarizes the constraint definitions for all of the boundary zones.

Deformation

tab allows you to define the deformation.

Number of Parameters

defines the number of parameters available to define the motion of the control points.

Parameter Values

allows you to define either the magnitude of deformation associated with each parameter (when you are manually specifying the deformation or using Design Exploration in Ansys Workbench to explore multiple deformation scenarios) or the bounds for each parameter (when you are using a built-in optimizer).

par1, par2...

specify the magnitude of deformation associated with each parameter. You can enter a numeric value in the field or use the P icon to create or assign an input parameter (see Select Input Parameter Dialog Box (p. 4928) for details). These fields and icons are only available when **none** or **workbench** is selected from the **Optimizer** drop-down list in the

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Optimizer tab. Note that the value entered here will specify a length in meters for translations and radial motions, and will specify an angle in degrees for rotations; these units will be used regardless of what units you are using in the case.

Apply

saves definitions for the parameter fields in the **Parameter Values** group box. This button is only available when **none** or **workbench** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Set Bounds...

opens the Parameter Bounds Dialog Box (p. 5500), where you can define strict minimum and maximum values for the parameters. Note that this button is not available when **workbench** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Motion Settings...

opens the Motion Settings Dialog Box (p. 5486), where you can define the motion of the control points.

Deform

applies the current settings in the **Parameter Values** group box, modifies the mesh, and updates the mesh display in the graphics window. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Check

displays a mesh check report in the console for the mesh displayed in the graphics window. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab. The mesh check report provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the x axis for axisymmetric cases, in the same manner as the **Check** button in the **General** task page (see Checking the Mesh (p. 1222) for details).

Reset

undoes any modifications made to the mesh as a result of the **Deform** button and updates the mesh display in the graphics window.

Optimizer

tab allows you to define the settings for the optimizer.

Optimizer

specifies which optimizer is used. The choices include **none** (for manual deformation); **compass**, **newuoa**, **powell**, **rosenbrock**, **simplex**, and **torczon** (for optimization in Ansys Fluent); and **workbench** (for optimizing using Design Exploration in Ansys Workbench). Note that **workbench** is only available if you have launched your Ansys Fluent session from Ansys Workbench. For information about how the built-in optimizers function or how to use Design Exploration, see Design Analysis and Optimization (p. 4439) in the User's Guide or Working With Input and Output Parameters in Workbench in the Ansys Fluent in Workbench User's Guide, respectively.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Objective Function Definition...

opens the Objective Function Definition Dialog Box (p. 5496), where you can specify the format of the objective function that will be minimized during the optimization process. This button is not available if **none** or **workbench** is selected from the **Optimizer** drop-down list.

Optimizer Settings

allows you to specify the optimizer settings. This group box is not available if **none** or **workbench** is selected from the **Optimizer** drop-down list.

Maximum Number of Designs

defines the maximum number of design stages the optimizer will undergo to reach the specified objective function.

Maximum Iterations per Design

defines the maximum number of iterations Ansys Fluent will perform for each design change.

Optimizer Convergence Criteria

defines the convergence criteria for the optimizer.

Initial Parameter Variation

defines how much the parameters will be allowed to vary during the initial calculations when **newuoa** is selected from the **Optimizer** drop-down list.

Mesh Quality

allows you to enable and define a mesh quality check: if the orthogonal quality (as defined in Mesh Quality (p. 1120)) for any cell of a mesh is less than a specified value, no solution is calculated for the mesh and Fluent proceeds to the next design stage. This group box is not available if **none** is selected from the **Optimizer** drop-down list.

Reject Poor Quality Meshes

enables the consideration of orthogonal quality when determining whether a solution should be calculated for a mesh.

Minimum Orthogonal Quality

defines the minimum orthogonal quality value every cell must have in order for a solution to be calculated for a mesh. Values may range from `0`–`1` (where `0` represents the worst quality).

Case and Data File Sets

allows you to enable the automatic saving of intermediate case and data files at specified intervals during the optimization run, so that you can restart an interrupted solution in the same or a different Fluent session without increasing the overall number of design iterations

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

needed to reach convergence. This group box is not available if **none** or **workbench** is selected from the **Optimizer** drop-down list.

Save Every

specifies the frequency (in number of design iterations) that you want intermediate case and data file sets saved. Note that the default value is **0**, which specifies that no intermediate files will be saved.

Maximum Number Retained

specifies the maximum number of intermediate case and data files sets you want to retain. After the maximum limit of file sets has been saved, Ansys Fluent begins overwriting the earliest existing intermediate file set.

File Name

specifies a root name for the intermediate case and data file sets, which will be appended with a number that represents the design iteration during which it was saved. Note that you can include a folder path in the file name if you want the files saved outside of the working folder.

Initialization

provides settings that determine how the solution variables are treated after the mesh is deformed during the optimization process. This group box is not available if **none** or **workbench** is selected from the **Optimizer** drop-down list.

Method

allows you to select one of the following:

Initialize Data After Morphing

specifies that the solution variables should be initialized to the values defined in the **Solution Initialization** task page after deformation.

Continue with Current Data

specifies that the solution variables should remain the values obtained in the previous design iteration.

Read Data File After Morphing

specifies that the solution variables are set to the values obtained from the data file specified in the **Data File Name** text-entry box after deformation. This selection is not available when **newuoa** is selected from the **Optimizer** drop-down list.

Data File Name

specifies the data file from which the solution variables are obtained when **Read Data File After Morphing** is selected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Execute Commands

allows you to specify commands (text commands or command macros) that will be run during the optimization runs of the mesh morpher/optimizer. This group box is not available if **none**, **newuoa**, or **workbench** is selected from the **Optimizer** drop-down list.

Initial Commands

specifies the commands that will be run after the design has been modified, but before Ansys Fluent has started to run the calculation for that design stage.

End Commands

specifies the commands that will be run after the solution has run and converged for a design stage.

Monitor...

opens the Optimization History Monitor Dialog Box (p. 5499), which allows you to plot and/or record how the value of the objective function varies with each design stage. This button is not available if **none**, **newuoa**, or **workbench** is selected from the **Optimizer** drop-down list.

Apply

saves the settings in the **Optimizer** tab.

Summary

displays a summary of the mesh morpher/optimizer settings in the console.

Optimize

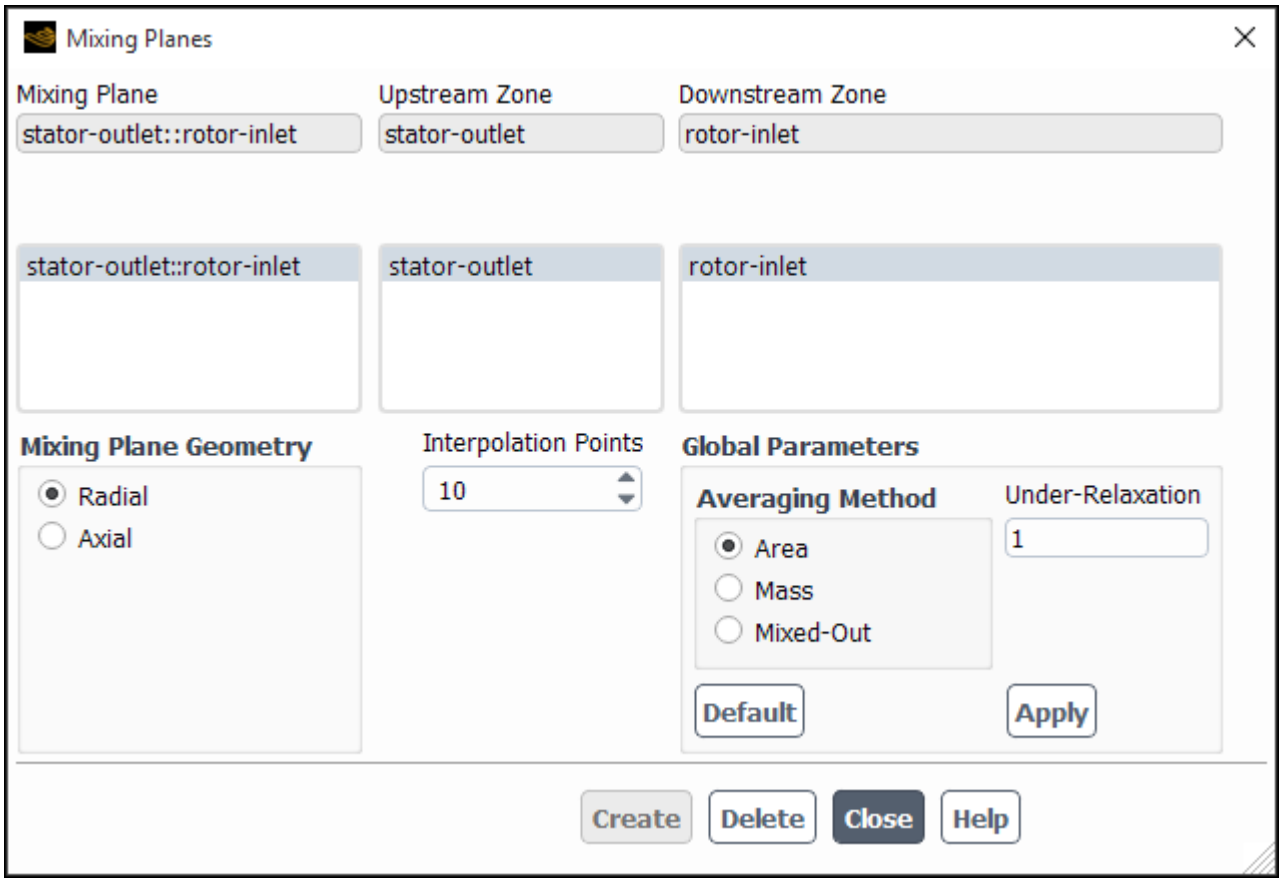
initiates the optimization process using the settings saved in all of the tabs of the **Mesh Morpher/Optimizer** dialog box. This button is not available if **none** or **workbench** is selected from the **Optimizer** drop-down list.

51.2.76. Mixing Planes Dialog Box

The **Mixing Planes** dialog box allows you to define the mixing planes for a mixing plane model. See Setting Up the Legacy Mixing Plane Model (p. 1935) for details about using the items below.

Domain → **Mesh Models** → **Mixing Planes...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mixing Plane

contains a list from which you can select an existing mixing plane, and an informational field in which Ansys Fluent displays the name of the currently selected (or most recently created) mixing plane.

Upstream Zone, Downstream Zone

contain lists from which you can select the boundaries on the upstream and downstream sides of the mixing plane, and informational fields that show the names of the zone you selected in each list. (You cannot edit these fields; the name in each field will be the name of the zone you selected in the list below it.)

Interpolation Points

specifies the number of radial or axial locations used in constructing the boundary profiles for circumferential averaging. This item appears only in 3D.

Mixing Plane Geometry

defines the geometry of the mixing plane interface. This item appears only in 3D.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Radial

specifies that information at the mixing plane interface is to be circumferentially averaged into profiles that vary in the radial direction, for example, $p(r)$, $T(r)$.

Axial

specifies that circumferentially averaged profiles are to be constructed that vary in the axial direction, for example, $p(x)$, $T(x)$.

Global Parameters

contains parameters related to the mixing plane calculation.

Averaging Method

consists of three profile averaging methods.

Area

is the default method and is expressed using Equation 2.17 in the Theory Guide.

Mass

provides better representation of the total quantities than the area averaging method. It is defined by Equation 2.18 of the Theory Guide.

Mixed-Out

is most representative of non-uniform flow profiles and is expressed using Equation 2.20 in the Theory Guide.

Under-Relaxation

specifies the under-relaxation factor for updating the boundary values at mixing planes.

Apply

sets the specified **Under-Relaxation**.

Default

sets the **Under-Relaxation** to its default value, as assigned by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

Reset

resets the **Under-Relaxation** to its most recently saved value (that is, the value before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

Create

creates the specified mixing plane (and assigns it a name in the **Mixing Plane** field).

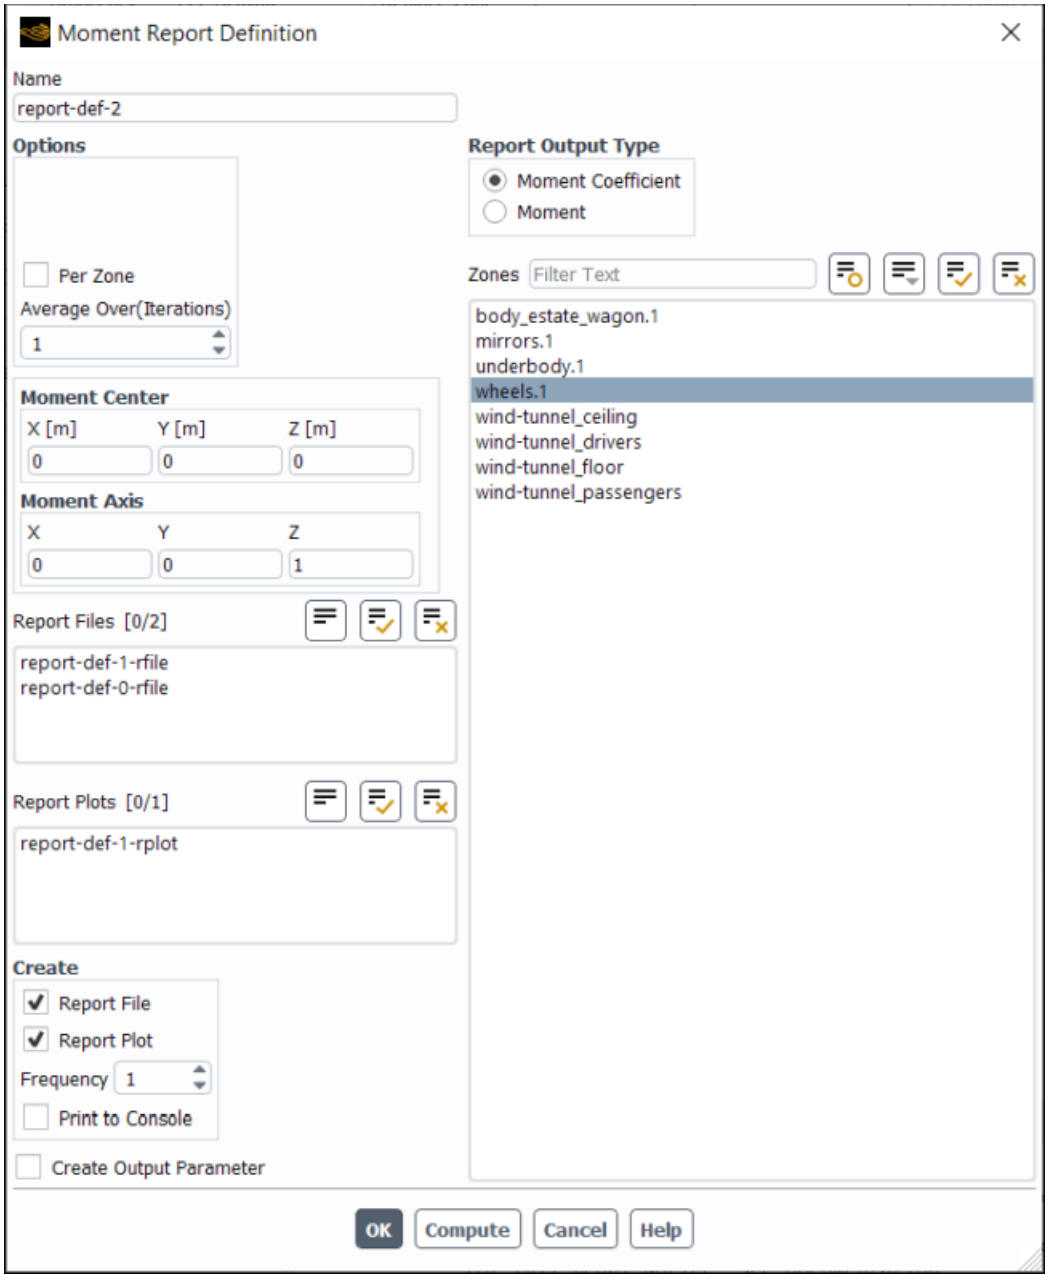
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

deletes the mixing plane selected under **Mixing Plane**.

51.2.77. Moment Report Definition Dialog Box

Solution → Reports → Definitions → New → Force Report → Moment...



Controls

Name

specifies the name of the report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

Per Zone

specifies whether or not moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), Fluent computes and monitors the total force for all of the selected walls combined together.

Average Over (Time-Steps), Average Over (Iterations)

(optional) To have Fluent calculate a running average for the **Moment Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Moment Center

contains the Cartesian coordinates of the moment center.

Moment Axis

contains the Cartesian coordinates of the moment vector to be monitored.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Report Output Type

Moment Coefficient

specifies the report definition as a unitless quantity.

Moment

specifies that the report definition has units of force.

Zones

lists the zones you can select for moment computation.

OK

creates the report definition.

Compute

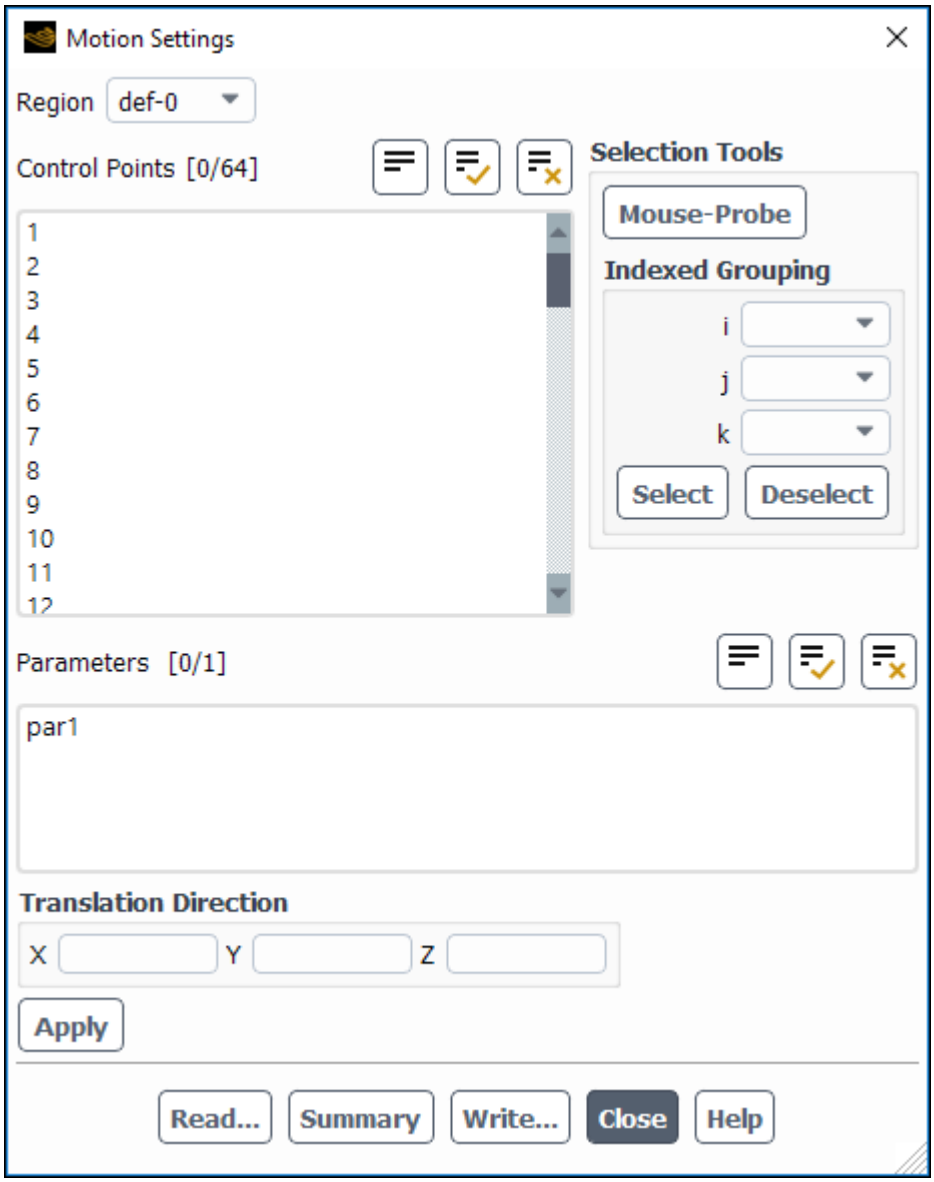
computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.78. Motion Settings Dialog Box

The **Motion Settings** dialog box allows you to define the motion of the control points, as part of the definition of the deformation produced by the mesh morpher/optimizer. Note that the controls and workflow of this dialog box are very much dependent on the selection in the **Control Point Distribution** list in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box. See Using the Mesh Morpher/Optimizer (p. 4568) for details about using this dialog box.

The **Motion Settings** dialog box is opened from the Mesh Morpher/Optimizer Dialog Box (p. 5471).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls (when **Regular** is selected from the **Control Point Distribution** list in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box)

Region

selects the deformation region for which you are assigning parameters and translation directions to control points.

Control Points

defines the control points to which you are assigning parameters and translation directions.

Selection Tools

provides tools for selecting the control points to which you are assigning parameters and translation directions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mouse-Probe

allows you to specify the **Control Points** by clicking in the graphics window with the mouse-probe button (which is the right mouse button, by default).

Indexed Grouping

allows you to select the control points based on their assigned indices.

i

allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-1 vector (as defined in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box).

j

allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-2 vector (as defined in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box).

k

allows you to select from a list of control point index numbers, which identify the location in a sequence (starting at the origin of the region) of control points along the direction-3 vector (as defined—though not displayed—in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box).

Select

adds the control points that satisfy the selected index criteria (that is, the selections from the **i**, **j**, and **k** drop-down lists) to the list of selected **Control Points**.

Deselect

removes the control points that satisfy the selected index criteria (that is, the selections from the **i**, **j**, and **k** drop-down lists) from the list of selected **Control Points**.

Parameters

specifies the names of the parameters (whose values are displayed in the **Parameter Values** group box in the **Deformation** tab of the **Mesh Morpher/Optimizer** dialog box) that you are assigning to the **Control Points**. The products of the values associated with these parameters and the settings specified in the **Translation Direction** group box define the displacement of the control points during manual deformation.

Translation Direction

allows you to define coefficients in the *x*, *y*, and (for 3D cases) *z* directions to scale the magnitude of deformation for the selected parameters. If you use a built-in optimizer, these coefficients provide the direction of the displacement of the control points and the optimizer determines the overall magnitude of displacement. Alternatively, if you manually specify the deformation or use Design Exploration in Ansys Workbench to explore multiple deformation scenarios, the values you enter in the **Translation Direction** group box are multiplied with the values of the **Parameters**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(as displayed in the **Parameter Values** group box in the **Deformation** tab of the **Mesh Morpher/Optimizer** dialog box) to define the displacement of the control points.

X

defines the scaling coefficient applied to the deformation parameter in the *x* direction.

Y

defines the scaling coefficient applied to the deformation parameter in the *y* direction.

Z

defines the scaling coefficient applied to the deformation parameter in the *z* direction. This number-entry box is only available for 3D cases.

Apply

saves the selections made in the **Parameters** selection list and the values entered in the **Translation Direction** group box, and assigns these parameter settings to the control points selected in the **Control Points** selection list.

Read...

allows you to define your motion settings by reading an ASCII text file. See Mesh Morpher/Optimizer File Formats (p. 5635) for further details about the text file format.

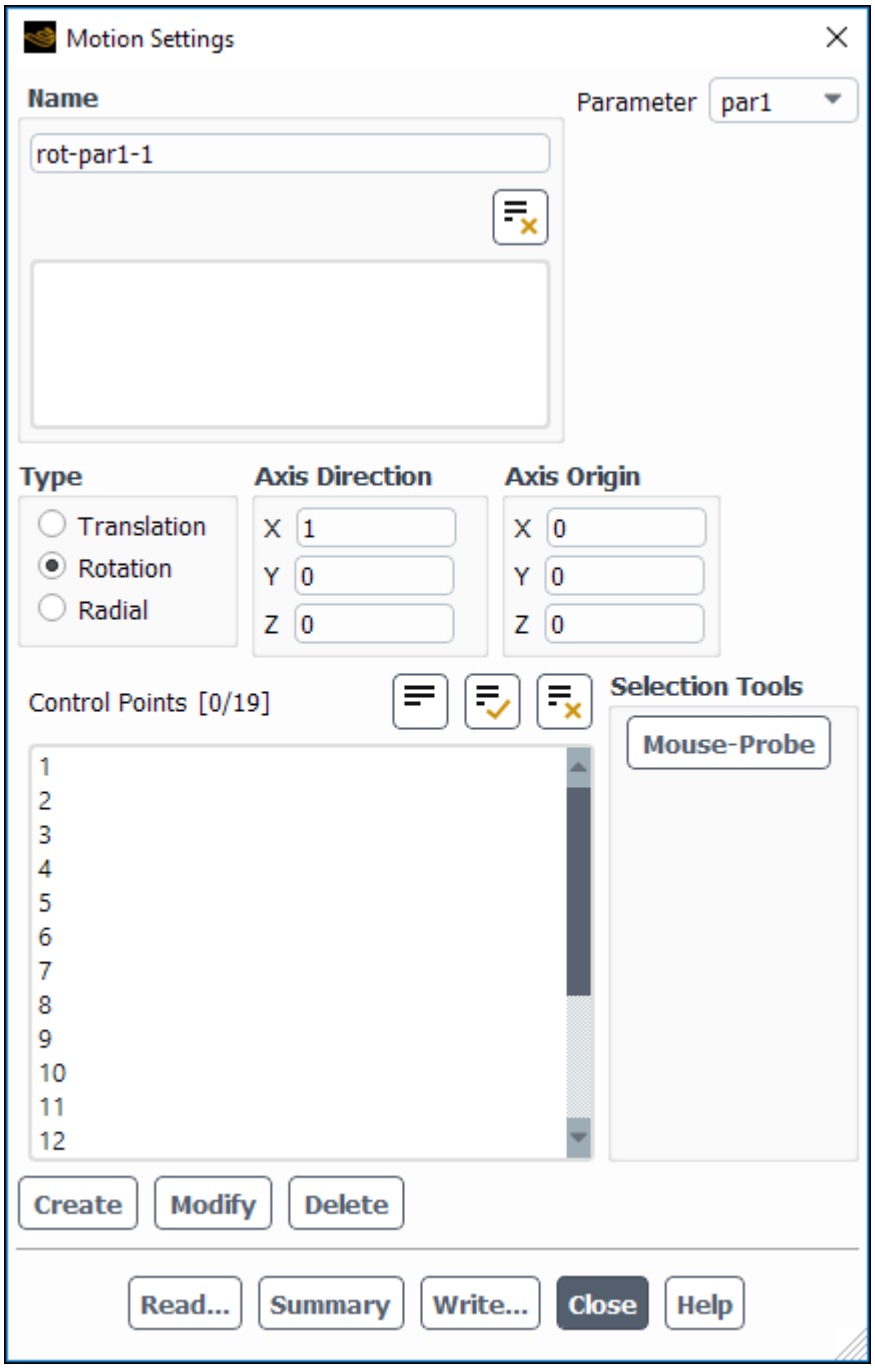
Summary

displays a summary of the saved motion settings in the console.

Write...

allows you to write your saved motion settings to an ASCII text file. See Mesh Morpher/Optimizer File Formats (p. 5635) for further details about the text file format.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls (denoted by * - when **Unstructured** is selected from the **Control Point Distribution** list in the **Regions** tab of the **Mesh Morpher/Optimizer** dialog box)

Name

provides controls for the motions you are defining. The upper text-entry box defines the name of the motion that is created when you click the **Create** button (which by default is based on the type of motion and the related parameter). The lower selection list allows you to select a motion that has already been created, in order to display the selections associated with it, or to modify or delete the motion using the **Modify** or **Delete** buttons, respectively.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameter

allows you to select the parameter (whose value is displayed in the **Parameter Values** group box in the **Deformation** tab of the **Mesh Morpher/Optimizer** dialog box) for the motion.

Type

allows you to specify the type of motion you want to define.

Translation

specifies that the motion is a translation, based on the settings in the **Direction** group box.

Rotation

specifies that the motion is a rotation about a point (for 2D) or an axis (for 3D), based on the settings in the **Axis Origin** group box and (for 3D cases) **Axis Direction** group box.

Radial

specifies that the motion is defined radially about a point (for 2D) or an axis (for 3D), based on the settings in the **Axis Origin** group box and (for 3D cases) **Axis Direction** group box.

Direction

allows you to define coefficients in the **X**, **Y**, and (for 3D cases) **Z** directions to scale the magnitude of deformation for the selected parameter. If you use a built-in optimizer, these coefficients provide the direction of the displacement of the control points and the optimizer determines the overall magnitude of displacement. Alternatively, if you manually specify the deformation or use Design Exploration in Ansys Workbench to explore multiple deformation scenarios, the values you enter in the **Direction** group box are multiplied with the values of the **Parameter** (as displayed in the **Parameter Values** group box in the **Deformation** tab of the **Mesh Morpher/Optimizer** dialog box) to define the displacement of the control points.

This group box is only available when **Translation** is selected from the **Type** list.

Axis Direction

allows you to define the **X**, **Y**, and **Z** components of the vector about which the control points will rotate or move radially, when the selection in the **Type** list is **Rotation** or **Radial**, respectively. This group box is only available for 3D cases.

Axis Origin

allows you to define the **X**, **Y**, and (for 3D cases) **Z** coordinates of the origin about which the control points will rotate or move radially, when the selection in the **Type** list is **Rotation** or **Radial**, respectively.

Control Points*

allows you to select the control points that will undergo the motion.

Selection Tools*

provides tools for selecting the control points that will undergo the motion.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mouse-Probe*

allows you to specify the **Control Points** by clicking in the graphics window with the mouse-probe button (which is the right mouse button, by default).

Create

creates a new motion based on the currently displayed settings.

Modify

modifies the saved settings for the motion selected in the lower **Name** selection list.

Delete

deletes the motion selected in the lower **Name** selection list.

Read...*

allows you to define your motion definitions by reading an ASCII text file. See Mesh Morpher/Optimizer File Formats (p. 5635) for further details about the text file format.

Summary*

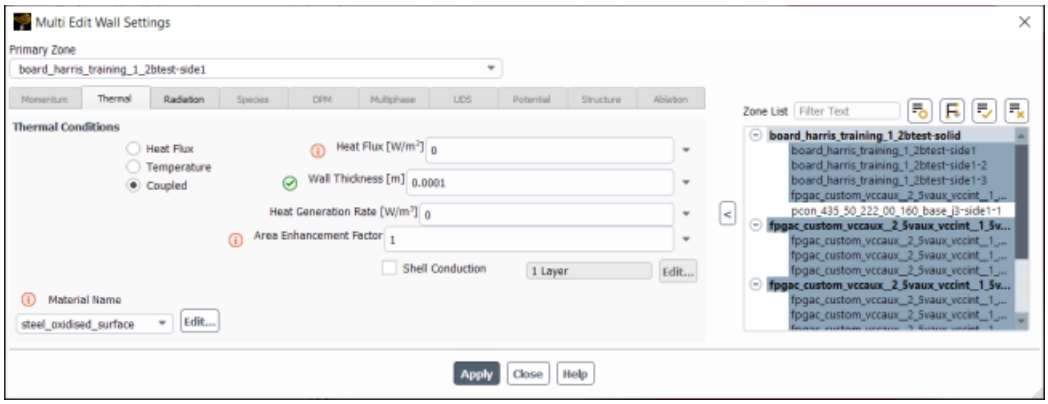
displays a summary of the saved motion definitions in the console.

Write...*

allows you to write your saved motion definitions to an ASCII text file. See Mesh Morpher/Optimizer File Formats (p. 5635) for further details about the text file format.

51.2.79. Multi Edit Dialog Box

Setup → Boundary Conditions → <selected boundaries> Multi-Edit...



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Primary Zone

drop-down list displaying the name of the selected "primary" boundary. *When the dialog box is first opened, the values of the primary zone are shown in all fields.*

Zone List

lists all of the zones that are compatible for multi-editing with the primary zone. The selected zones are the ones that will be modified on **Apply**.

Apply

applies the settings marked with the icon to the selected boundaries in the **Zone List**.

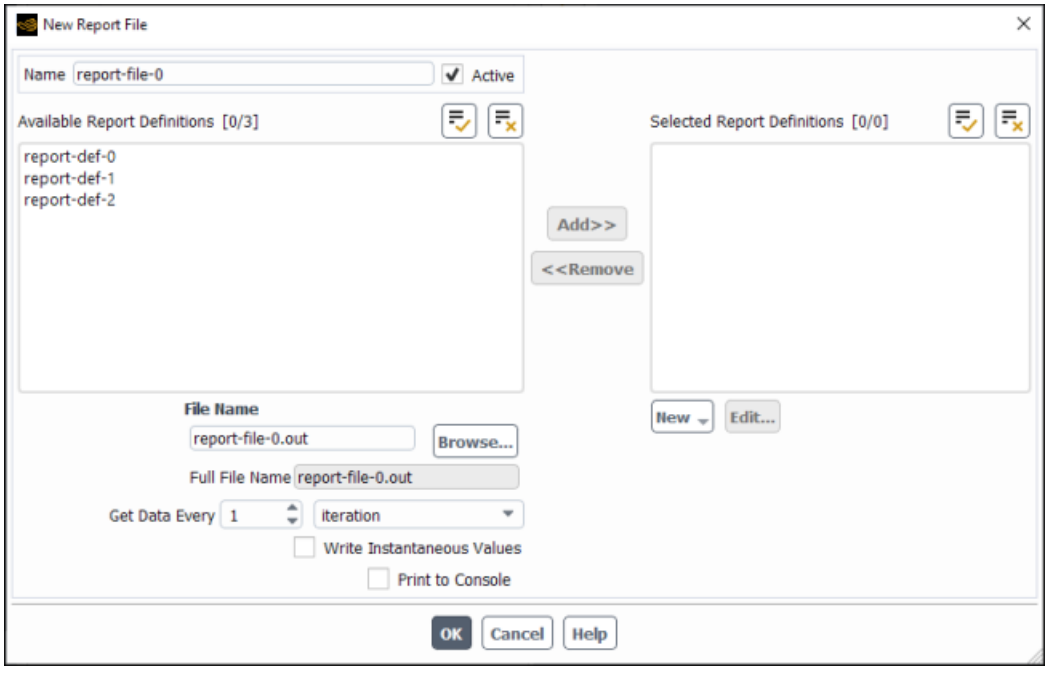
- indicates that the value of this setting varies between the selected boundaries in the **Zone List**.
- indicates that the displayed value will be applied to the selected boundaries in the **Zone List** when you click **Apply**.

Refer to Editing Multiple Boundary Conditions at Once (p. 1497) for additional information about this functionality. Note that while this image shows the **Multi Edit Velocity Wall Settings** dialog box, the functionality that is specific to multi-editing is consistent across the different multi-edit dialog boxes. For information on specific settings of boundary conditions, refer to Boundary Conditions Task Page (p. 4937) (which contains descriptions of each boundary's dialog box), and Boundary Conditions (p. 1370).

51.2.80. New Report File Dialog Box

Solution → Reports → File...

Click **New...** in the **Report File Definitions** dialog box to open the **New Report File** dialog box.



Controls

Name

editable field displaying the name of the report file.

Active

check box (enabled by default) that determines if the file is written during the solution calculation.

Available Report Definitions

lists all of the existing report definitions not currently part of this report file.

Add>>

moves the selected report definition(s) to the **Selected Report Definitions** list.

<<Remove

moves the selected report definition(s) to the **Available Report Definitions** list.

File Name

allows you to specify the name used when the file is saved.

Browse...

opens the **Select File** dialog box, allowing you to specify the location where the report file will be saved.

Full File Name

displays the name and location of the report file once it has been saved.

Get Data Every

indicates the frequency that the report definition data is written to the file. The default value of 1 allows you to write to the file at every iteration or time-step. If you select flow-time, then you must specify the frequency for writing the file in units of time. Time-step and flow-time are only a valid choices when you are calculating unsteady flow.

Print to Console

indicates whether or not the contents of the report file are printed to the console at the frequency specified in the **Get Data Every** field.

Selected Report Definitions

lists all of the existing report definitions currently included in this report file.

New

drop-down list allowing you to create new report definitions (surface, volume, force, flux, mesh, aeromechanics, dpm, expression, and user-defined).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

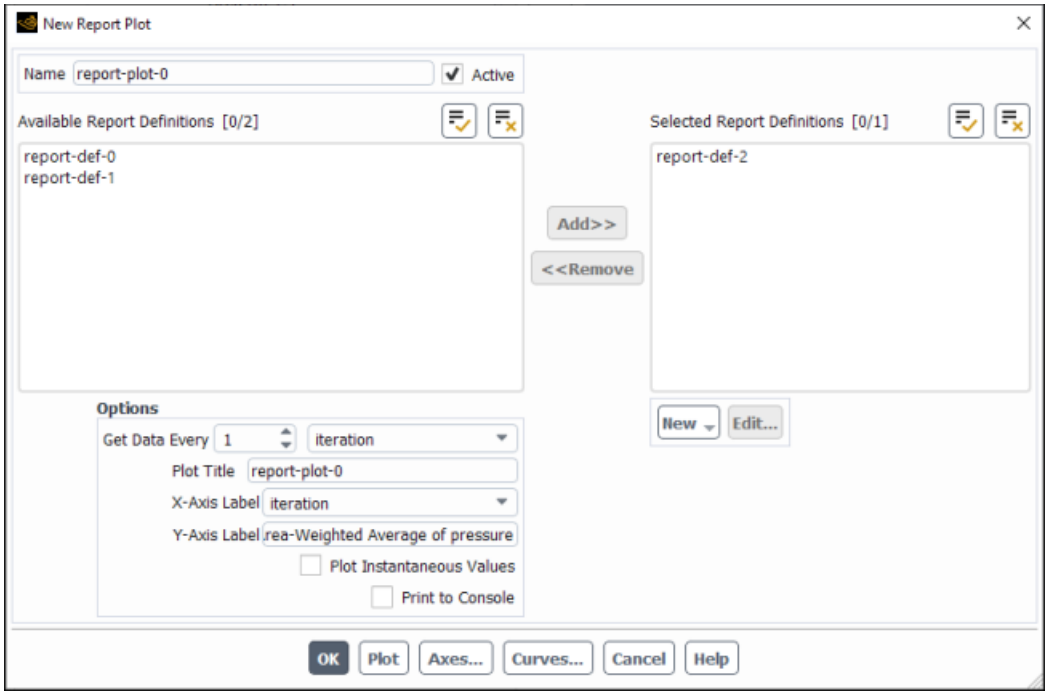
Edit...

allows you to modify the highlighted report definition in the **Selected Report Definition** list.

51.2.81. New Report Plot Dialog Box

Solution → Reports → Plot...

Click **New...** in the **Report Plot Definitions** dialog box to open the **New Report Plot** dialog box.



Controls

Name

editable field displaying the name of the report plot.

Active

check box (enabled by default) that determines if the plot is plotted during the solution calculation.

Available Report Definitions

lists all of the existing report definitions not currently part of this report plot.

Add>>

moves the selected report definition(s) to the **Selected Report Definitions** list.

<<Remove

moves the selected report definition(s) to the **Available Report Definitions** list.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

Get Data Every

indicates the frequency that the report definition data is plotted. The default value of 1 allows you to write to the file at every iteration or time-step. If you select flow-time, then you must specify the frequency for plotting the data in units of time. Time-step and flow-time are only a valid choices when you are calculating unsteady flow.

Plot Title

provide a title for the plot.

X-Axis Label

choose whether the X-axis is flow-time or time-step.

Y-Axis Label

enter a label for the Y-axis.

Print to Console

indicates whether or not the contents of the report plot are printed to the console at the frequency specified in the **Get Data Every** field.

Selected Report Definitions

lists all of the existing report definitions currently included in this report plot.

New

drop-down list allowing you to create new report definitions (surface, volume, force, flux, mesh, aeromechanics, dpm, expression, and user-defined).

Edit...

allows you to modify the highlighted report definition in the **Selected Report Definition** list.

Curves...

opens the Curves Dialog Box (p. 5262).

Axes...

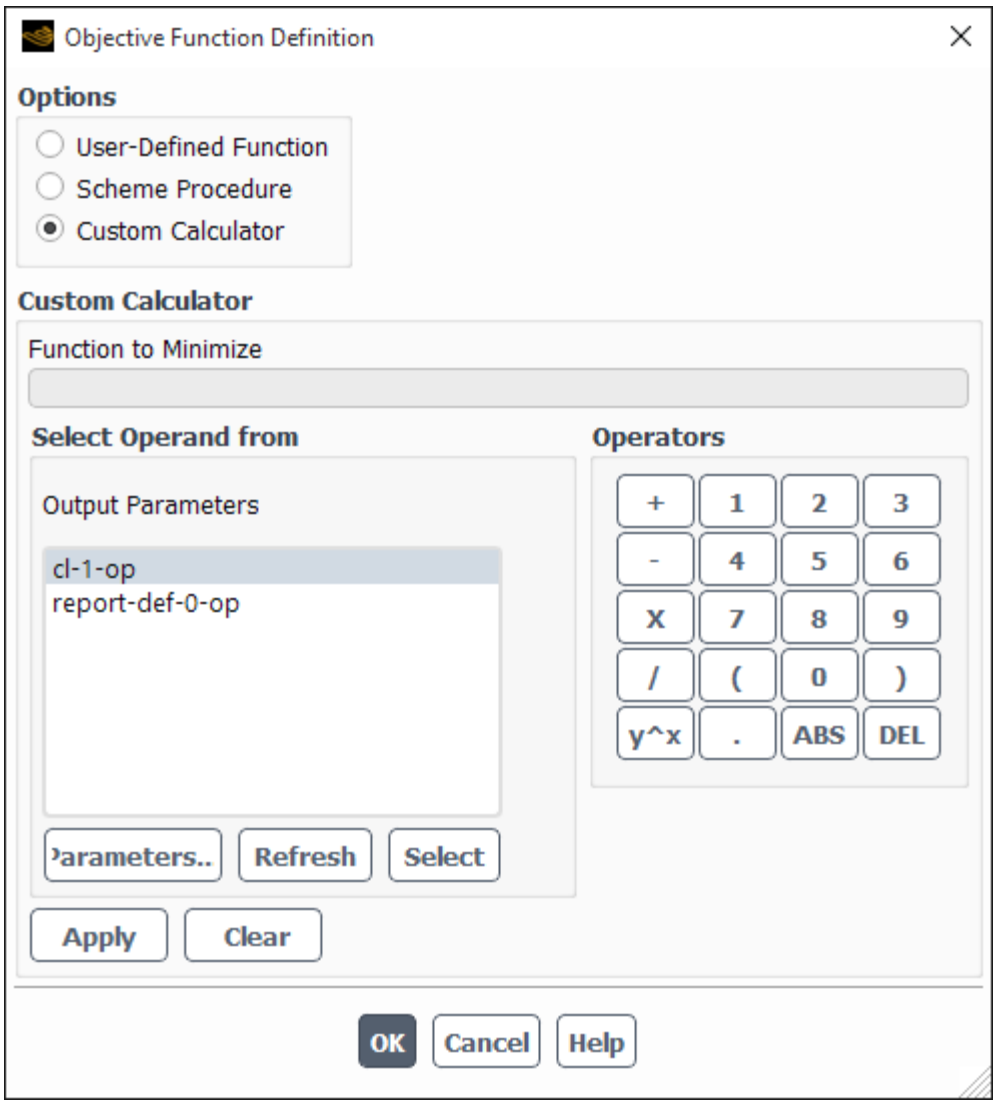
opens the Axes Dialog Box (p. 5259).

51.2.82. Objective Function Definition Dialog Box

The **Objective Function Definition** dialog box allows you to specify the format of the objective function that will be minimized by the mesh morpher/optimizer and (when it is a customized function of output parameters) to define the objective function. See Using the Mesh Morpher/Optimizer (p. 4568) for details about using this dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The **Objective Function Definition** dialog box is opened from the Mesh Morpher/Optimizer Dialog Box (p. 5471).



Controls

Options

contains options for the format of the objective function.

User-Defined Function

specifies that the objective function is provided via a user-defined function.

Scheme Procedure

specifies that the objective function is provided via a Scheme source file. This option is not available if **newuoa** is selected from the **Optimizer** drop-down list in the **Optimizer** tab of the **Mesh Morpher/Optimizer** dialog box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Custom Calculator

specifies that the objective function is based on output parameters, and is defined by the controls in the **Custom Calculator** group box. This option is not available if **newuoa** is selected from the **Optimizer** drop-down list in the **Optimizer** tab of the **Mesh Morpher/Optimizer** dialog box.

Custom Calculator

allows you to define the objective function. This group box is only available when **Custom Calculator** is selected from the **Options** list.

Function to Minimize

displays the objective function defined by the controls in the **Custom Calculator** group box.

Select Operand from

allows you to include output parameters in the definition of the objective function.

Output Parameters

provides a list of available output parameters, which can be included in the definition of the objective function.

Parameters...

opens the Parameters Dialog Box (p. 5284), which you can use to create additional output parameters.

Refresh

updates the **Output Parameters** list, so that all available output parameters are displayed.

Select

enters the output parameter that is currently selected in the **Output Parameters** list in the **Function to Minimize** field.

Operators

allows you to include calculator operators in the definition of the objective function. Clicking a button in this group box causes the appropriate symbol to appear in the **Function to Minimize** field.

Apply

saves the custom objective function (displayed in the **Function to Minimize** field) as part of the case file.

Clear

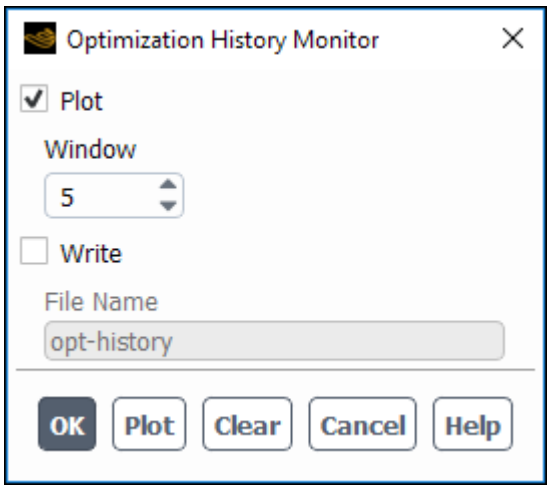
deletes all of the text in the **Function to Minimize** field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.83. Optimization History Monitor Dialog Box

The **Optimization History Monitor** dialog box allows you to plot and/or record optimization history data, that is, how the value of the objective function (defined using the Mesh Morpher/Optimizer Dialog Box (p. 5471)) varies with each design stage produced by the mesh morpher/optimizer. See Using the Mesh Morpher/Optimizer (p. 4568) for details about using this dialog box.

The **Optimization History Monitor** dialog box is opened from the Mesh Morpher/Optimizer Dialog Box (p. 5471).



Controls

Plot

enables the plotting of the optimization history data in the graphics window.

Window

optimization history data are automatically displayed in the appropriate window, so changing the number in the **Window** field will not modify the display location.

Write

enables the saving of the optimization history data to a file (with the name specified in **File Name**).

File Name

specifies the name of the file to which the optimization history data is written. This text-entry box is only available when the **Write** option is enabled.

Plot (button)

displays an XY plot of the optimization history data generated during the last calculation. Note that no plot will be displayed if the data was discarded using the **Clear** button.

Clear

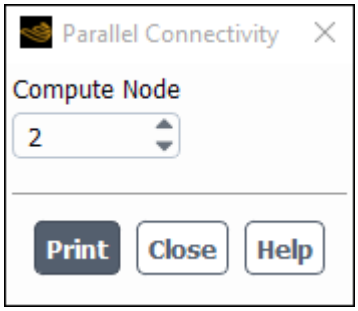
discards the optimization history data, including the associated files. Each of these actions must be confirmed in a Question Dialog Box (p. 907).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.84. Parallel Connectivity Dialog Box

The **Parallel Connectivity** dialog box prints the connectivity of the selected compute node. See Checking Network Connectivity (p. 4311) for details.

Parallel → Network → Connectivity...



Controls

Compute Node

indicates the compute node ID for which connectivity information is desired.

Print

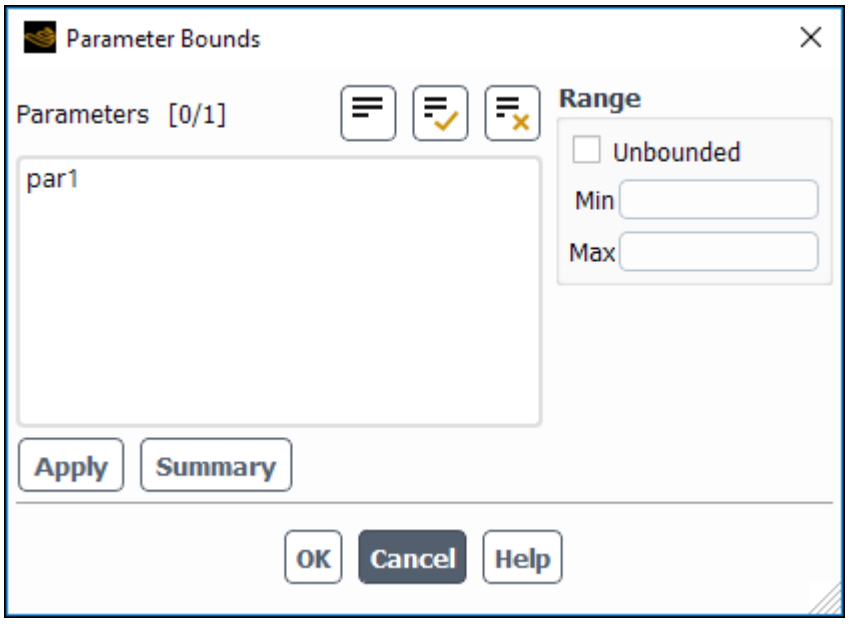
prints information (in the console window) about the network connectivity for the selected compute node.

51.2.85. Parameter Bounds Dialog Box

The **Parameter Bounds** dialog box allows you to limit how much each parameter is allowed to deform when using the mesh morpher/optimizer. See Using the Mesh Morpher/Optimizer (p. 4568) for details about using this dialog box.

The **Parameter Bounds** dialog box is opened from the Mesh Morpher/Optimizer Dialog Box (p. 5471).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Parameters

selects the parameters (created using the **Deformation** tab of the Mesh Morpher/Optimizer Dialog Box (p. 5471)) for which you are defining bounds.

Range

allows you to specify the bounds.

Unbounded

allows you to specify whether the selected **Parameters** are unbounded.

Min, Max

allows you to set the minimum and maximum values allowed for the selected **Parameters** when the **Unbounded** option is disabled.

Apply

saves the bounds for the currently selected **Parameters**.

Summary

displays a summary of all of the saved parameter bounds in the console.

51.2.86. Particle Tracks Dialog Box

The **Particle Tracks** dialog box controls the generation and display of discrete phase particles. See Displaying of Trajectories (p. 2831) for details about the items below.

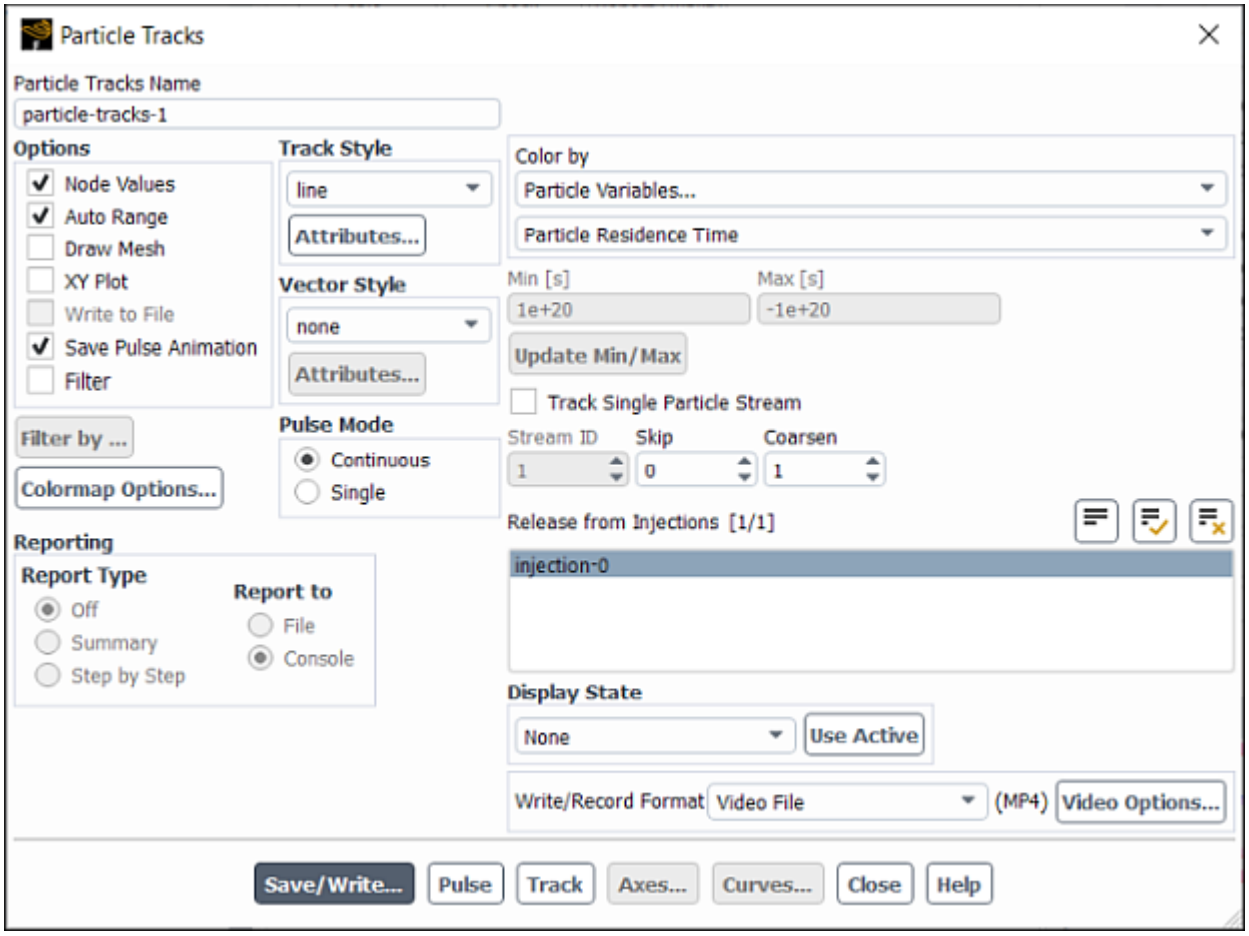
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Results → Graphics → Particle Tracks → New...

Note:

- The "global"/non-persistent form of graphics objects is hidden by default. If this interrupts your workflow, you can make them available by enabling the **Expose legacy non-persistent graphics** option in the **Graphics** branch of **Preferences** (accessed via **File**>**Preferences...**).
- (When you click **Edit...** instead of **New...**, it opens the "global"/non-persistent version of the **Particle Tracks** dialog box. This version of the dialog box does not have a **Name** field and it is not saved with the case file.

  You are encouraged to use the persistent version that is accessed by clicking **New...**.



Controls

Particle Tracks Name

is the name for a particle tracks definition. You can specify a name or use the default name **`particle-tracks-`*`id`*** . This control appears only for particle tracks definitions.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

contains the options described below:

Node Values

specifies that node values should be interpolated to compute the scalar field at a particle location. This option is turned on by default. See Choosing Node or Cell Values (p. 3905) for details.

Auto Range

specifies that the minimum and maximum values of the scalar field will be the limits of that field. If this option is not selected, you can enter **Min** and **Max** values manually. These values determine the range of the color scale.

Draw Mesh

toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 4636) is opened when **Draw Mesh** is selected.

XY Plot

enables the display of an XY plot along the particle trajectories for steady particle tracking and at the current particle locations for unsteady tracking. When this option is selected, the **Display** push button will change to **Plot**.

Write to File

(available only when **XY Plot** is on) activates the file-writing option. When this option is selected, the **Plot** push button will change to **Write...**. Clicking on the **Write...** button will open The Select File Dialog Box (p. 907), in which you can specify a name and save a file containing the XY plot data. The format of this file is described in XY Plot File Format (p. 4038).

Save Pulse Animation

allows you to save a video or picture files of the pulse animation. When this option is enabled, an additional field for **Write/Record Format** appears, allowing you to specify how the pulse animation will be saved. Clicking **Save/Write...** opens The Select File Dialog Box (p. 907) where you can specify a name and save the video or picture files.

A **Continuous** pulse video file will be 5 seconds long, while a **Single** pulse video will be one full cycle.

Filter

when selected, the **Filter by...** button becomes available.

Filter by...

opens the Particle Filter Attributes Dialog Box (p. 5190) where you can specify how you would like to filter the particles being displayed. This button is available when **Filter** is selected in the **Options** group box.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Colormap Options...

opens the Colormap Dialog Box (p. 5226), allowing you to customize the colormap for this graphics object.

Reporting

allows you to specify how you would like to report particle tracks.

Report Type

controls the type of trajectory-fate reports to be displayed.

Off

disables reporting of trajectory fates.

Summary

enables summary reports of trajectory fates. See Particle Tracking Statistics (p. 2843) for details.

Step by Step

enables the step-by-step reporting of trajectories. This item will not appear if you have requested unsteady tracking in the Discrete Phase Model Dialog Box (p. 4793). See Step-by-Step Reporting of Trajectories (p. 2852) for details.

Current Positions

enables the reporting of the positions and velocities of all particles that are in the domain at the current time. This item appears only when unsteady tracking has been requested in the Discrete Phase Model Dialog Box (p. 4793). See Reporting of Current Positions for Unsteady Tracking (p. 2854) for details.

Report to

indicates the destination of the trajectory report.

File

enables the writing of the trajectory report to a file. When this option is enabled, the **Track** button will become the **Write...** button.

Console

enables the display of the trajectory report information in the console window.

Significant Figures

controls the number of significant figures used when a **Step by Step** or **Current Positions** report is selected.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sample File Format

allows you to generate a file containing particle current positions in the same file format that is used for particle sampling. This item is available only for unsteady particle tracking when **Current Positions** and **File** are selected in the **Reporting** group box. See Reporting of Current Positions for Unsteady Tracking (p. 2854) for details.

Reporting Variables...

opens the Reporting Variables Dialog Box (p. 5191) that contains a list from which you can select the scalar field to be used to color the particle tracks.

Track Style

sets the trajectory style. Trajectories can be displayed as lines, ribbons, spheres, cylinders, or a set of points. Pulsing can be done only on **point** or **line** styles.

Attributes...

opens the Track Style Attributes Dialog Box (p. 5192), Particle Sphere Style Attributes Dialog Box (p. 5193), or the Ribbon Attributes Dialog Box (p. 5189), depending on the selected **Track Style**. These dialog boxes allow you to set the attributes for the chosen trajectory style.

Vector Style

sets the trajectory vector style. You can display the trajectories vectors in three different ways: **vector**, **centered-vector**, and **centered-cylinder**. All three styles are demonstrated in Controlling the Vector Style of Particle Tracks (p. 2838).

Attributes...

opens the Particle Vector Style Attributes Dialog Box (p. 5194).

Pulse Mode

specifies either a single or continuous release of particles that follow the trajectories, starting at the release surface, when you use the **Pulse** button to animate the trajectories.

Continuous

sets the pulse mode to continuously release particles from the initial positions.

Single

sets the pulse mode to release a single wave of particles.

The **Pulse Mode** is used only when particles are being **Pulsed**.

Y Axis Function

contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the **XY Plot** option is turned on.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X Axis Function

contains a list of functions for the X-axis of the plot. You can plot the quantity selected in the **Y Axis Function** drop-down list as a function of the **Time** elapsed along the trajectory, or the **Path Length** along the trajectory.

This item appears when the **XY Plot** option is turned on.

Phase

(Multiphase only) specifies the phase where the postprocessing operations are being applied.

Min/Max

display the values to which the lower and upper ends of the color scale map. If you are using the **Auto Range** option, these values will be automatically computed when you click **Compute**. If you are not using **Auto Range**, you can enter values manually.

Update Min/Max

computes the **Min** and **Max** for the field chosen in **Color by**.

Track PDF Transport Particles

enables the tracking of PDF transport particles. This item is available only when the composition PDF transport model is enabled.

Free Stream Particles

enables the tracking of free stream particles. Note that this option is available only when the Lagrangian wallfilm model is enabled in the wall boundary conditions dialog box, under the **DPM** tab.

Wall Film Particles

enables the tracking of wall film particles. Note that this option is available only when the Lagrangian wallfilm model is enabled in the wall boundary conditions dialog box, under the **DPM** tab.

Track Single Particle Stream

enables the tracking of a single particle stream in the selected injection, instead of all the streams in that injection. See Displaying of Trajectories (p. 2831) for details.

Stream ID

specifies the particle stream to be tracked when the **Track Single Particle Stream** option is enabled.

Skip

allows you to "thin" or "sample" the particles that are displayed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Coarsen

reduces the plotting time by reducing the number of points that are plotted for a given trajectory in any cell. This is valid only for steady-state cases.

Release from Injections

selects the injections from which to release particles. You must select at least one injection before any particles can be released.

Display State

specifies the display state that is associated with this graphics object.

drop-down list of display states

selectable list of all the existing display states associated with this case.

Use Active

creates a display state that matches the settings of the active graphics window and assigns it to this graphics object (this association is only saved after you click **Save/Display**).

Write/Record Format

(only present when **Save Pulse Animation** is enabled) drop-down list specifying whether you are saving the pulse animation as a video file or as picture files. The default formats are shown in parenthesis next to the field.

Video Options...

(only present when **Save Pulse Animation** is enabled and **Video File** is selected for **Write/Record Format**) opens the Video Options Dialog Box (p. 5206).

Picture Options...

(only present when **Save Pulse Animation** is enabled and **Picture Files** is selected for **Write/Record Format**) opens the Save Picture Dialog Box (p. 5200).

Display

displays the particle trajectories and generates a trajectory report in the console window (if requested) for steady particle tracking. For unsteady particle tracking, only the current particle locations will be shown.

Save/Display

displays the particle tracks (steady tracking) or the current particle locations (unsteady tracking) in the active graphics window and saves the particle track definition. This button appears only for particle track definitions and replaces the **Display** button.

Plot

displays an XY plot along the particle trajectories. This button replaces the **Display** button when the **XY Plot** option is turned on.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Write...

opens The Select File Dialog Box (p. 907), in which you can save the XY plot data or trajectory report to a file. This button replaces the **Plot** button when the **Write to File** option is turned on, or the **Track** button when the **File** option is selected under **Report to**.

Pulse

animates the position of particles. If **Pulse Mode** is set to **Continuous**, particles are reintroduced at the seed positions repeatedly. If the mode is **Single**, a single wave of particles moves through the domain. **Pulse** is not available for unsteady tracking.

The label of this button changes to **Stop !** when the animation is in progress. Click **Stop !** to stop pulsing (and the label goes back to **Pulse**).

Track

computes the particle trajectories and generates any reports without displaying the trajectories in the graphics window.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the XY plot axes. This item appears when the **XY Plot** option is turned on.

Curves...

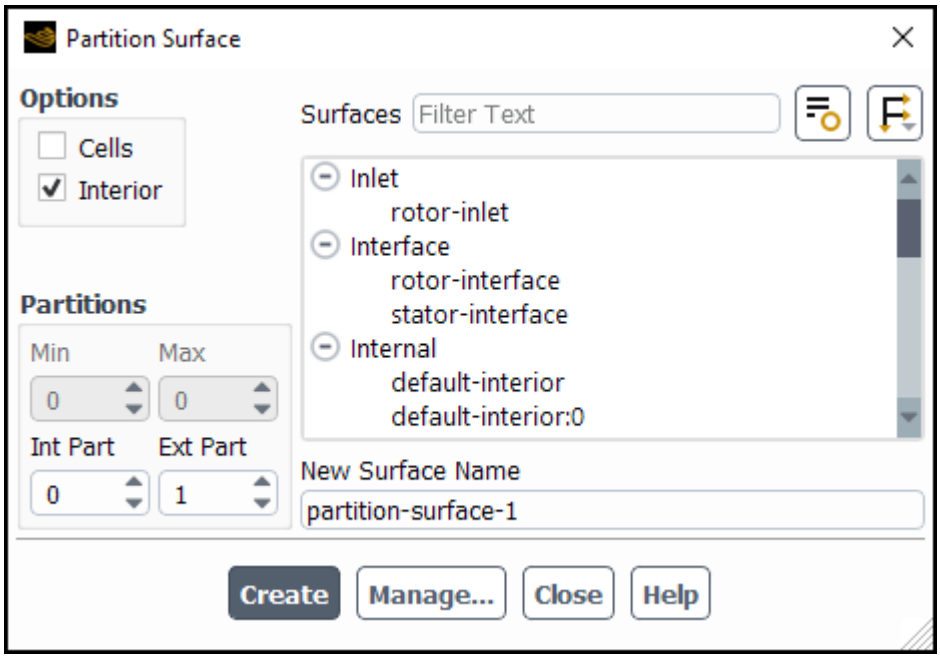
opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the XY plot. This item appears when the **XY Plot** option is turned on.

51.2.87. Partition Surface Dialog Box

The **Partition Surface** dialog box allows you to create a surface defined by the boundary of two adjacent mesh partitions. See Partition Surfaces (p. 3797) for details about the items below.

Domain → **Surface** → **Create** → **Partition...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains check buttons that allow you to choose interior or exterior faces or cells to be contained in the partition surface.

Cells

specifies, when enabled, that the partition surface will consist of cells (either interior or exterior, depending on the status of the **Interior** check button) that lie on the partition boundary. When this option is disabled, the faces on the boundary between partitions will make up the partition surface. Depending on the status of the **Interior** check button, the faces will reflect data values for the interior or exterior cells.

Interior

toggles between interior and exterior cells. If the partition surface consists of faces instead of cells, **Interior** specifies for which cells data will be displayed on the faces. When this option is enabled, interior cells (cells that are on the **Int Part** side of the partition boundary) will make up the partition surface. When it is disabled, the partition surface will consist of exterior cells (cells that are on the **Ext Part** side of the partition boundary).

Partitions

contains information about which partitions are under consideration. The boundary that defines the partition surface is the boundary between the **Int Part** and the **Ext Part**. If there are more than two mesh partitions, each interior partition will share boundaries with several exterior partitions. By setting the appropriate values for **Int Part** and **Ext Part**, you can create surfaces for any of these boundaries.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min/Max

indicates the minimum and maximum ID numbers of the mesh partitions. The minimum is always zero, and the maximum is one less than the number of processors.

Int Part

indicates the ID number of the interior partition (that is, the partition under consideration).

Ext Part

indicates the ID number of the bordering partition.

Surfaces

displays an informational list of existing surfaces.

New Surface Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Create

creates the surface.

Manage...

opens the Surfaces Dialog Box (p. 5571) in which you can rename and delete surfaces and determine their sizes.

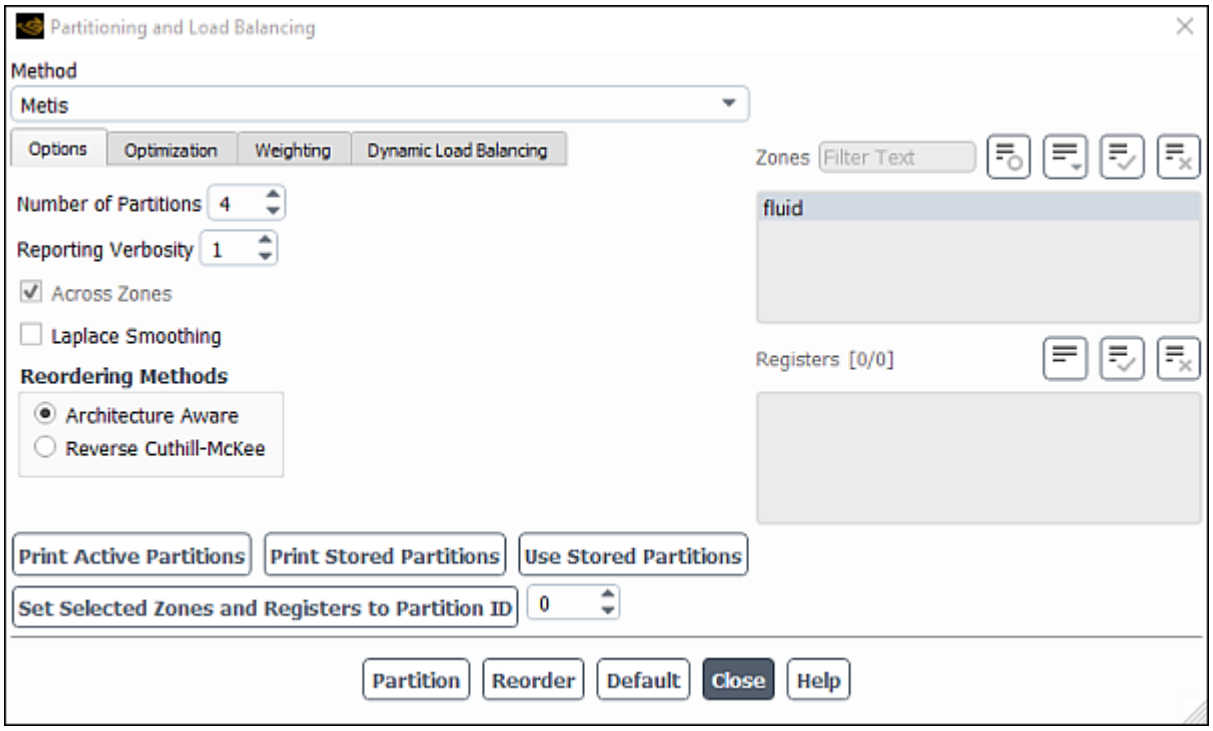
51.2.88. Partitioning and Load Balancing Dialog Box

The **Partitioning and Load Balancing** dialog box allows you to partition the mesh into separate clusters of cells for separate processors on a parallel computer. See Partitioning the Mesh Manually and Balancing the Load (p. 4285) for details.

The **Partitioning and Load Balancing** dialog box also allows you to enable and control Ansys Fluent's load balancing feature. Load balancing will automatically detect and analyze parallel performance, and redistribute cells between the existing compute nodes to optimize it. See Load Balancing (p. 4295) for more information about load balancing.

Parallel → General → Partitioning/Load Balancing...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Method

contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the **Cartesian Axes**, **Cartesian Strip**, **Cartesian X-Coordinate**, **Cartesian Y-Coordinate**, **Cartesian Z-Coordinate**, **Cartesian R Axes**, **Cartesian RX-Coordinate**, **Cartesian RY-Coordinate**, **Cartesian RZ-Coordinate**, **Cylindrical Axes**, **Cylindrical R-Coordinate**, **Cylindrical Theta-Coordinate**, **Cylindrical Z-Coordinate**, **Metis**, **Polar Axes**, **Polar R-Coordinate**, **Polar Theta-Coordinate**, **Principal Axes**, **Principal Strip**, **Principal X-Coordinate**, **Principal Y-Coordinate**, **Principal Z-Coordinate**, **Spherical Axes**, **Spherical Rho-Coordinate**, **Spherical Theta-Coordinate**, and **Spherical Phi-Coordinate** techniques, which are described in Mesh Partitioning Methods (p. 4297).

Options

tab

Number of Partitions

defines the desired number of mesh partitions. This usually matches the number of processors available for parallel computing.

Reporting Verbosity

specifies the amount of information to be reported in the text (console) window during the partitioning. With the default value of 1, Fluent will print the number of partitions created, the number of bisections performed, the time required for the partitioning, and the minimum and maximum cell, face, interface, and face-ratio variations. (See Interpreting Partition Statistics (p. 4305) for details.) If you increase the **Reporting Verbosity** to 2, the partition method used, the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

faces for each partition will also be printed in the console window. If you decrease the **Reporting Verbosity** to 0, only the number of partitions created and the time required for the partitioning will be reported.

Across Zones

allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended *only* when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Laplace Smoothing

enables the Laplace smoothing method, which can be used to prevent partition boundaries from passing through regions of high aspect ratio cells. This can improve the convergence and scalability of the flow and conjugate heat transfer computations for cases with regions of highly stretched cells.

Cutoff Aspect Ratio

controls the threshold for the Laplace smoothing method.

Reordering Method

is used to optimize parallel performance

Architecture Aware

is the default option and it accounts for the system architecture and network topology in remapping the partitions to the processors.

Reverse Cuthill-McKee

minimizes the bandwidth of the compute-node connectivity matrix (the maximum distance between two connected processes) without incorporating the system architecture.

Optimization

tab contains options for enabling schemes to optimize the partitions created by the selected partition method. In addition, the optimization scheme will be applied until appropriate criteria are met, or the maximum number of iterations have been run. If the **Iterations** counter is set to 0, the optimization scheme will be applied until completion, without limit on the maximum number of iterations.

Merge

attempts to decrease the number of interfaces by eliminating orphan cell clusters (an orphan cluster is a group of connected cells whose members each have at least one face coincident with an interface boundary).

Smooth

attempts to minimize the number of interfaces by sacrificing cells on the partition boundary to the neighboring partition to reduce the partition boundary surface area.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pre-Test

instructs Fluent to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose **Principal Axes** or **Cartesian Axes** as the partitioning method.

Weighting

tab allows you to set the appropriate weights, prior to partitioning the mesh.

Weight Types

allows you to turn on/off a specific weight. Weight types include: **Faces per Cell** (enabled by default, with additional weighting of **2**), **Solid Zones** (available and enabled by default only if solid cell zones are defined); **VOF** (available only if the volume of fluid multiphase model is turned on); **DPM** (available only for discrete phase simulations with injections defined), where you can specify **Hybrid Optimization**; and **ISAT**.

User Specified

allows you to specify that Ansys Fluent timers set the weight scaling (by not enabling the check box), or to modify the value yourself (by enabling the check box and entering a numerical value in the **Value** field.)

Value

allows you to enter a user-specified numerical value to modify the weighting set by the Ansys Fluent timers. Note that for **VOF**, **DPM**, and **ISAT**, this value is not relevant when using model-weighted partitioning.

Dynamic Load Balancing

tab allows you to set load balancing thresholds and intervals.

Physical Models

allows you to set thresholds and intervals for the simulation's physical models.

Threshold

is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval

allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, Ansys Fluent will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a nonzero value. Ansys Fluent will then attempt to perform load balancing after every N iterations, where N is the specified **Balance Interval**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Dynamic Mesh

allows you to set load balancing threshold and interval values for your dynamic mesh. This option is only available when the dynamic mesh model is enabled.

Auto

allows a percentage of interface faces and loads to be automatically traced.

Threshold

is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval

allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, Ansys Fluent will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a nonzero value. Ansys Fluent will then attempt to perform load balancing after every N iterations, where N is the specified **Balance Interval**.

Mesh Adaption

allows you to set threshold values for mesh adaption.

Threshold

is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Zones

contains a list of cell zones. Partitioning will be applied to cells in zones selected from this list.

Registers

contains a list of cell registers that have been created using the adaption tools. You can restrict partitioning to a group of cells by selecting a register containing the cells. See Partitioning Within Zones or Registers (p. 4294) for details.

Print Active Partitions

prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each active partition (see Checking the Partitions (p. 4304) for information about active partitions) in the console. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Print Stored Partitions

prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each stored partition (see Checking the Partitions (p. 4304) for information about stored partitions) in the console. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Set Selected Zones and Registers to Partition ID

allows you to set a value that assigns selected **Zones** and/or **Registers** to a specific partition ID. A region or zone is marked before setting the marked cells to one of the partition IDs.

Use Stored Partitions

allows you to make the stored cell partitions the active cell partitions in a parallel session. The active cell partition is used for the current calculation, while the stored cell partition (the last partition performed) is used when you save a case file.

Partition

subdivides the mesh into the selected number of partitions using the prescribed method and optimization(s).

Default

sets all controls to their default values, as assigned by Ansys Fluent. After execution, the **Default** button becomes the **Reset** button.

Reset

resets the fields to their most recently saved values (that is, the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

51.2.89. Pathlines Dialog Box

The **Pathlines** dialog box controls the generation and display of pathlines. See Displaying Pathlines (p. 3895) for details about the items below.

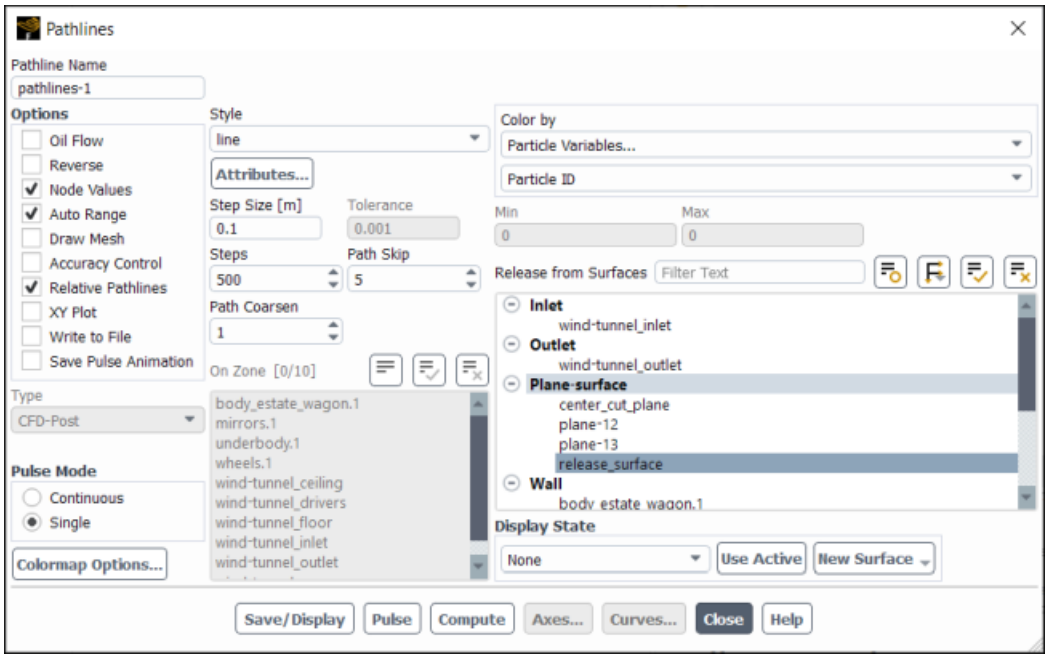
Results → **Graphics** → **Pathlines** → **New...**

Note:

- The "global"/non-persistent form of graphics objects is hidden by default. If this interrupts your workflow, you can make them available by enabling the **Expose legacy non-persistent graphics** option in the **Graphics** branch of **Preferences** (accessed via **File**>**Preferences...**).
- (When you click **Edit...** instead of **New...**, it opens the "global"/non-persistent version of the **Pathlines** dialog box. This version of the dialog box does not have a **Name** field and it is not saved with the case file.

  You are encouraged to use the persistent version that is accessed by clicking **New...**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Pathline Name

is the name for a pathline definition. You can specify a name or use the default name **`path-line-`*`id`*** . This control appears only for pathline definitions.

Options

contains the options described below:

Oil Flow

toggles between regular pathlines and oil-flow pathlines. When this option is selected, pathlines are constrained to lie on the zone(s) selected in the **On Zone** list.

Reverse

specifies that each particle's path is traced back in time. This option is turned off by default.

Node Values

specifies that node values should be interpolated to compute the scalar field at a particle location. This option is turned on by default. See Choosing Node or Cell Values (p. 3905) for details.

Auto Range

specifies that the minimum and maximum values of the scalar field will be the limits of that field. If this option is not selected, you can enter **Min** and **Max** values manually. These values determine the range of the color scale.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Draw Mesh

when enabled opens the Mesh Display Dialog Box (p. 4636) where you can specify how to display your mesh.

Accuracy Control

allows you to specify tolerance to control the pathlines accuracy.

Relative Pathlines

allows you to display the pathlines relative to the rotating reference frame.

XY Plot

enables the display of an XY plot along the pathline trajectories. When this option is selected, the **Display** push button will change to **Plot**.

Write to File

activates the file-writing option. When this option is enabled, the **Type** option becomes active and the **Save/Plot** button changes to **Save/Write...**. Clicking **Save/Write...** opens The Select File Dialog Box (p. 907) where you can specify a name and save a file containing the XY plot data. The format of this file is described in XY Plot File Format (p. 4038).

Save Pulse Animation

allows you to save a video or picture files of the pulse animation. When this option is enabled, an additional field for **Write/Record Format** appears, allowing you to specify how the pulse animation will be saved. Clicking **Save/Write...** opens The Select File Dialog Box (p. 907) where you can specify a name and save the video or picture files.

A **Continuous** pulse video file will be 5 seconds long, while a **Single** pulse video will be one full cycle.

Type

specifies the type of the file you want to write.

CFD-Post

allows you to write the file in CFD-Post compatible format, which can be read in **CFD-Post**.

Fieldview

allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

Geometry

allows you to write the file in `.ibl` format, which can be read in GAMBIT.

EnSight

allows you to write the file in `.encas` format, which can be read in EnSight.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pulse Mode

specifies either a single or continuous release of particles that follow the pathlines, starting at the release surface, when you use the **Pulse** button to animate the pathlines.

Continuous

sets the pulse mode to continuously release particles from the initial positions.

Single

sets the pulse mode to release a single wave of particles.

The **Pulse Mode** is used only when particles are being pulsed.

Colormap Options...

opens the Colormap Dialog Box (p. 5226), allowing you to customize the colormap for this graphics object.

Style

sets the pathline style. Pathlines can be displayed as lines, ribbons, spheres, cylinders, or a set of points. The **ribbon** style also uses the **Twist By** field and the **TwistFactor** value (specified in the Ribbon Attributes Dialog Box (p. 5189)). Pulsing can be done only on **point** or **line** styles.

Attributes...

opens the Path Style Attributes Dialog Box (p. 5189) or the Ribbon Attributes Dialog Box (p. 5189), depending on the selected **Style**. These dialog boxes allow you to set the attributes (ribbon width, marker size, cylinder radius, twist-by field, and so on) for the chosen pathline style.

Step Size

sets the interval used for computing the next position of a particle. This is in units of length. Particle positions are always computed when they enter/leave a cell. If you specify a very large size, the particle positions at entry/exit of each cell will still be computed (and displayed).

Tolerance

allows you to control the error when using large time step sizes for the calculation. This is available when **Accuracy Control** is selected under **Options**.

Steps

sets the maximum number of steps a particle can advance. A particle's path may also end if it leaves the domain.

Path Skip

allows you to "thin" or "sample" the pathlines that are displayed. See "Thinning" Pathlines (p. 3899) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Path Coarsen

reduces the time and the number of points plotted in a pathline. Coarsening factor of 'n' will result in plotting of each 'n'th point for a given pathline in each cell.

On Zone

contains a list from which you can select the zone(s) on which the particles are constrained to lie. This list is activated only when the **Oil Flow** option is selected.

Track in Phase

(for the Eulerian Multiphase model only) allows you to select the phase or the mixture of all phases for tracking particle pathlines.

Color by

contains a list from which you can select the scalar field to be used to color the pathlines. The default is **Particle ID**, a unique ID for each particle.

Y Axis Function

contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the **XY Plot** option is turned on.

X Axis Function

contains a list of functions for the x axis of the plot. You can plot the quantity selected in the **Y Axis Function** drop-down list as a function of the **Time** elapsed along the trajectory, or the **Path Length** along the trajectory.

This item appears when the **XY Plot** option is turned on.

Phase

(Multiphase only) specifies the phase where the postprocessing operations are being applied.

Min/Max

display the values to which the lower and upper ends of the color scale map. If you are using the **Auto Range** option, these values will be automatically computed when you click **Compute**. If you are not using **Auto Range**, you can enter values manually.

Release from Surfaces

selects the surfaces from which to release particles. You must select at least one surface before any particles can be released.

Display State

specifies the display state that is associated with this graphics object.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

drop-down list of display states

selectable list of all the existing display states associated with this case.

Use Active

creates a display state that matches the settings of the active graphics window and assigns it to this graphics object (this association is only saved after you click **Save/Display**).

New Surface

is a drop-down list button that contains a list of surface options:

Point

opens the Point Surface Dialog Box (p. 5525).

Line/Rake

opens the Line/Rake Surface Dialog Box (p. 5458).

Plane

opens the Plane Surface Dialog Box (p. 5523).

Quadric

opens the Quadric Surface Dialog Box (p. 5527).

Iso-Surface

opens the Iso-Surface Dialog Box (p. 5445).

Iso-Clip

opens the Iso-Clip Dialog Box (p. 5444).

Structural Point

opens the Structural Point Surface Dialog Box (p. 5565).

Write/Record Format

(only present when **Save Pulse Animation** is enabled) drop-down list specifying whether you are saving the pulse animation as a video file or as picture files. The default formats are shown in parenthesis next to the field.

Video Options...

(only present when **Save Pulse Animation** is enabled and **Video File** is selected for **Write/Record Format**) opens the Video Options Dialog Box (p. 5206).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Picture Options...

(only present when **Save Pulse Animation** is enabled and **Picture Files** is selected for **Write/Record Format**) opens the Save Picture Dialog Box (p. 5200).

EnSight Encas File Name

allows you to specify a.encas file name if you selected **EnSight** under **Type**.

Browse...

opens The Select File Dialog Box (p. 907) where you can select the `.encas` file.

Time Steps For EnSight Export

allows you to set the number of time levels that are available for animation in EnSight.

Display

displays the pathlines in the active graphics window.

Save/Display

plots the pathlines in the active graphics window and saves the pathline definition. This button appears only for pathline definitions and replaces the **Display** button.

Plot

displays an XY plot along the pathline trajectories. This button replaces the **Display** button when the **XY Plot** option is turned on.

Write...

opens The Select File Dialog Box (p. 907), in which you can save the XY plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

Pulse

animates the position of particles. If **Pulse Mode** is set to **Continuous**, particles are reintroduced at the seed positions repeatedly. If the mode is **Single**, a single wave of particles moves through the domain.

The label of this button changes to **Stop !** when the animation is in progress. Click **Stop !** to stop pulsing (and the label goes back to **Pulse**).

Compute

computes the **Min** and **Max** for the field chosen in **Color by**.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to customize the XY plot axes. This item appears when the **XY Plot** option is turned on.

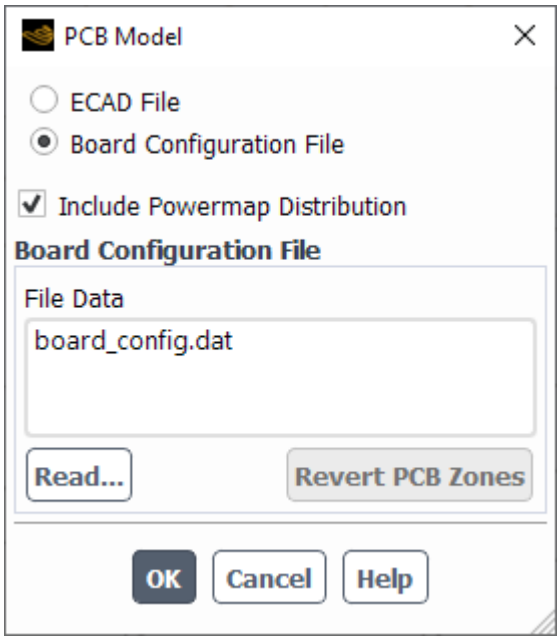
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Curves...

opens the Curves Dialog Box (p. 5262), which allows you to customize the curves used in the XY plot. This item appears when the **XY Plot** option is turned on.

51.2.90. PCB Model Dialog Box

The **PCB Model** dialog box allows you to model printed circuit boards (PCB) that vary considerably due to their layered construction and highly variable metal fraction at any particular location. See Thermal Analysis of Printed Circuit Boards (p. 2283) for details about the items below.



Controls

Board Configuration File

contains the options for the PCB model described below:

Read..

reads the board configuration file produced by Ansys Icepak.

File Data

displays the name of the board configuration file.

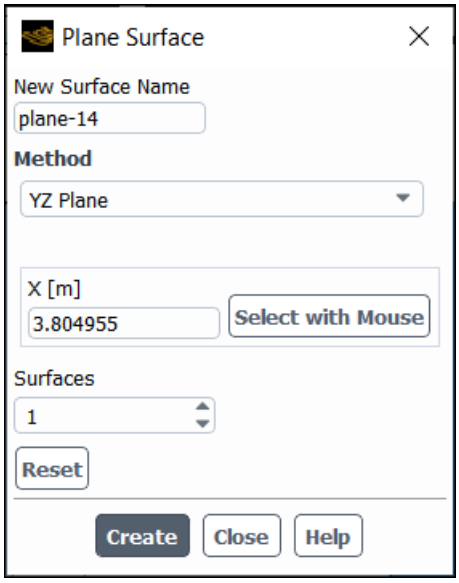
Include Powermap Distribution

select to include powermap distribution as part of the analysis from additional files generated by Ansys Icepak.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.91. Plane Surface Dialog Box

The **Plane Surface** dialog box allows you to interactively create one or more planar surfaces that cut through the domain. See Plane Surfaces (p. 3810) for details about the items below.



Controls

New Surface Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Name Format

[Creating multiple YZ, ZX, XY planes only] indicates how Fluent will name the surfaces.

The field will look something like `plane-x={x:+.6f}`. This naming format results in plane names that reflect the coordinates of the plane. For example, if you create three YZ planes, with a spacing of 0.05m, starting from X=2.325m, the planes will be named `plane-x=+2.325000`, `plane-x=+2.375000`, and `plane-x=+2.425000`. You can control how many significant digits are included in the plane name by varying the value represented by 6 in the example name format. The `f` in the example name indicates that the output is a float. Changing the `f` to an `e` results in the coordinate being represented as an exponential.

Method

displays the selected plane creation method.

YZ Plane

create a plane surface in the YZ plane.

ZX Plane

create a plane surface in the ZX plane.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

XY Plane

create a plane surface in the XY plane.

Point and Normal

create a plane surface based on a point and its normal. Normal can optionally be computed from a surface or the current view.

Three Points

create a plane surface based on three points.

Normal

settings related to specifying the normal direction for a **Point and Normal** plane surface.

iX, iY, iZ

designates the coordinates of the end point of the normal vector (the start point being 0, 0, 0).

Compute from Surface

computes values for the **Normal** based on the surface selected from the drop-down above.

Compute from View Plane

computes values for the **Normal** based on the current view orientation in the graphics window.

Options

contains options for defining the plane surface.

Bounded

enables the creation of a bounded parallelepiped, 3 of whose 4 corners are the 3 points that define the plane equation (or the 4 corners of the **Plane Tool**).

Sample Points

enables the specification of a point density along the 2 directions (of the parallelepiped). This creates a uniformly distributed set of points on the plane. (This item is available only when the **Bounded** option is enabled.)

Sample Density

specifies the density of points when the **Sample Points** option is enabled.

Edge 1, Edge 2

sets the point density along the two directions of the plane. (Edge 1 extends from point 0 to point 1, and edge 2 extends from point 1 to point 2.)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Select with Mouse

allows you to select points with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See Controlling the Mouse Button Functions (p. 3989) for information about setting mouse button functions.)

Point 1

designates the coordinates of the first point.

Point 2

designates the coordinates of the second point.

Point 3

designates the coordinates of the third point.

Surfaces

lists the number of surfaces that will be created at once.

Spacing

specifies the distance between surfaces.

Reset

resets the plane tool to its default position.

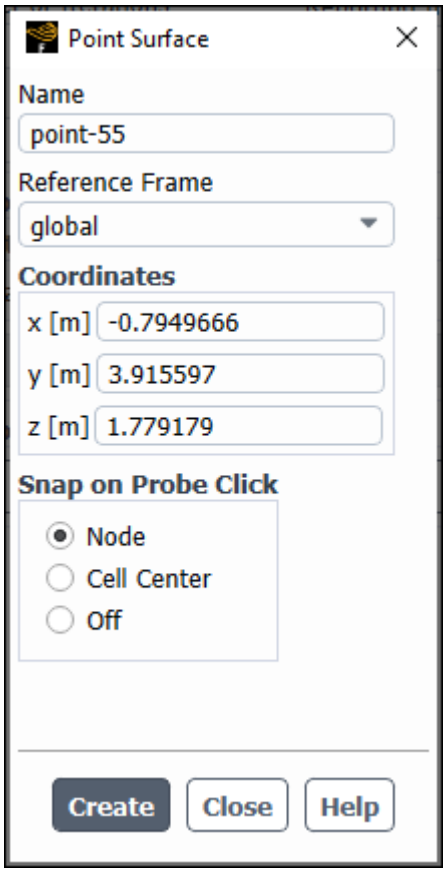
Create

creates the surface.

51.2.92. Point Surface Dialog Box

The **Point Surface** dialog box allows you to interactively create point surfaces (surfaces containing a single data point). See Point Surfaces (p. 3801) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Reference Frame

allows you to specify a local reference frame (if defined) for the point surface.

Coordinates

designates the coordinates of the point in the surface (**x0**, **y0**, **z0**).

Snap on Probe Click

updates the coordinates of the point to the closest **Node** or **Cell Center** when you click on the model in the graphics window using the probe tool—*that is, either by right-clicking or setting the left-mouse-button to probe (* *)*.

You can disable automatic snapping by selecting **Off**.

Create

creates the surface.

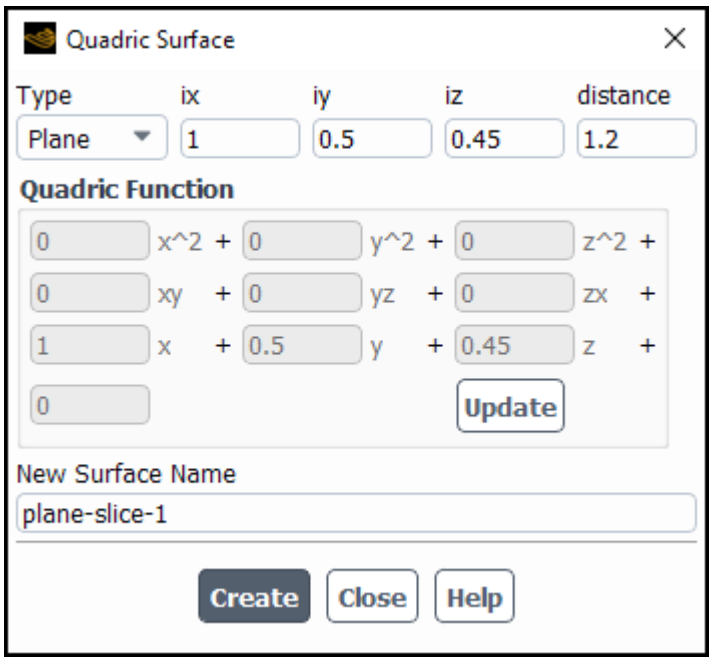
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.93. Quadric Surface Dialog Box

The **Quadric Surface** dialog box allows you to interactively define quadric functions and create surfaces from them. Lines and circles are commonly used types of quadric functions, so additional support is provided for defining them. See Quadric Surfaces (p. 3816) for details about using the items below.

Important:

Note that your inputs for the quadric function must be in SI units.



Controls

Type

selects the type of quadric function. Presently, you may select **Line/Plane**, **Circle/Sphere** or a general **Quadric**. Some of the control buttons take on different meanings for each of the three quadric function types.

Line/Plane

specifies that the surface will consist of all points on the domain that satisfy the equation $ix*x+iy*y+iz*z=distance$, where

ix

is the coefficient of x in the quadric function.

iy

is the coefficient of y in the quadric function.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

iz

is the coefficient of z in the quadric function.

distance

is the distance of the line/plane from the origin.

When you click the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

Circle/Sphere

specifies that the surface will consist of all points in the domain that satisfy the equation $(x-x0)^2+(y-y0)^2+(z-z0)^2=r^2$, where

x0,y0,z0

are the x,y,z coordinates of the center.

r

is the radius.

When you click the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

Quadric

specifies that the surface will consist of all points in the domain that satisfy the quadric function $Q=value$, where Q is the quadric function you define as shown below. You will enter **value** to the right of the **Type** entry, but the coefficients in the quadric function are entered directly in the **Quadric Function** box. Note that in 2D problems the z entries are ignored.

x^2, y^2, z^2, xy, yz, zx, x, y, z

are the coefficients of the corresponding terms in the quadric function.

Quadric Function

contains the display of the quadric function and the **Update** button. If you select **Line/Plane** or **Circle/Sphere** as the **Type**, the coefficients of the quadric function will be updated here when you click the **Update** button. You will not be able to edit the values in the **Quadric Function** box directly. If you select **Quadric** as the **Type**, you will enter the coefficients directly in this box, and the **Update** button will be inactive.

Update

updates the coefficients in **Quadric Function** to reflect the current input.

New Surface Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create

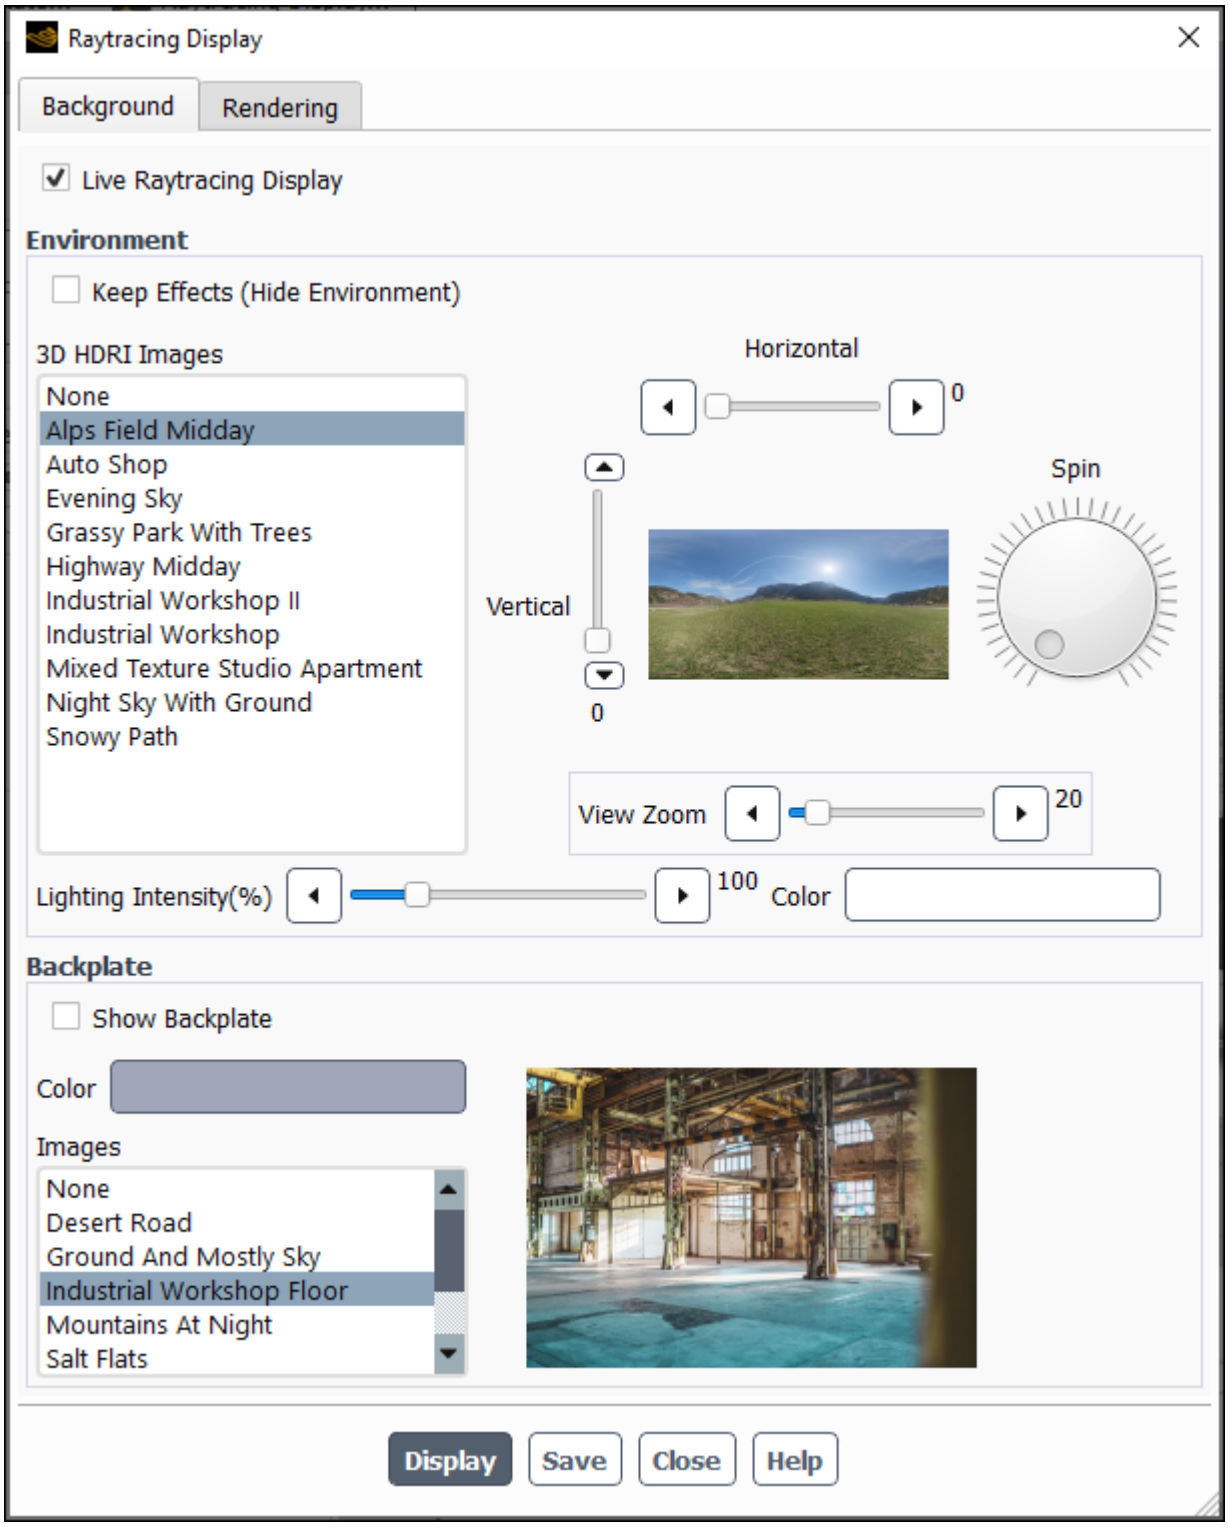
creates the surface.

51.2.94. Raytracing Display Dialog Box

The **Raytracing Display** dialog box allows you to create a realistic display that can incorporate lighting effects from an environment or lights defined in the case, and show your model in an environment with a backplate image or color. For information on how to use this dialog box, refer to Realistic Rendering Using Raytracing (p. 3965).

View → Graphics → Raytracing Display...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Background

tab that contains settings for the environment and backplate, which can be used to provide lighting effects and a background to the displayed model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Live Raytracing Display

allows for changes made to controls in the **Background** tab to be immediately reflected in the raytracing window (which is only seen after you click **Display**). *Changes made to settings on the **Background** tab while this option is enabled are automatically saved without the need to click **Save**.*

Environment

group box containing options that control the environment that can be used to affect the appearance of the model.

Keep Effects (Hide Environment)

this option keeps the effects of the environment on the model without showing the model in the environment. The background will be the same as the standard graphics display, unless you enable the **Show Backplate** option (in the **Backplate** group box).

3D HDRI Images

lists the available environments that you can use for your raytracing display. The light sources in these environments affect the appearance of the displayed model. A preview of each environment is shown in the image window to the right of the list.

Vertical

slider that controls the orientation of the environment. Adjusting this slider moves the environment vertically.

Horizontal

slider that controls the orientation of the environment. Adjusting this slider moves the environment horizontally.

Spin

rotation control that controls the orientation of the environment. Adjusting the spin control rotates the environment either clockwise or counterclockwise.

Lighting Intensity

slider controlling the intensity of the lighting for the selected environment. Moving the slider to the right increases the intensity of the light and moving it to the left decreases it.

Color

specifies the color that will be used to color the environment lighting.

View Zoom

slider that controls the overall zoom level of the raytracing window (sometimes referred to as "field view"). Zooming in/out with this control changes the zoom level of the entire raytracing display window, including the environment and the model. You can then re-

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

adjust the zoom level of the model by zooming in/out on the model in the original active window containing the interactive model display that is being raytraced.

Backplate

group box containing options that control the backplate that can be displayed behind the model.

Show Backplate

controls whether or not a backplate is displayed behind the model in the raytracing window. *When this option is enabled, the **Color** will be used unless you select an image from the **Images** list. The backplate will always be displayed "over top" of any selected environment.*

Color

specifies the color that will be displayed as the background behind the model when **Show Backplate** is enabled and **Images** is set to **None**.

Images

lists the available 2D backplates that you can use for your raytracing display. The selected image will be displayed as the background behind the model when **Show Backplate** is enabled. A preview of each image is shown in the window to the right of the list.

Rendering

tab that contains settings controlling how the raytracer functions and how pictures or hardcopies are saved.

CPU Threads

specifies how many processors are used by the raytracer in rendering the image. *If the number of **CPU Threads** specified is greater than the number of cores on the machine, the raytracer will use the maximum number available.*

Quality

specifies how "good" an image looks when rendered and saved as hardcopy picture. Better quality renderings are more expensive, that is they require more machine resources and take longer to render.

Save Picture...

opens the **Save Picture** dialog box (Save Picture Dialog Box (p. 5200)), allowing you to capture a hardcopy of the raytracer rendering.

Max. Rendering Time Before Image Capture [s]

specifies how long Fluent waits for the raytracer to render the display to the specified **Quality** before capturing the image.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Display

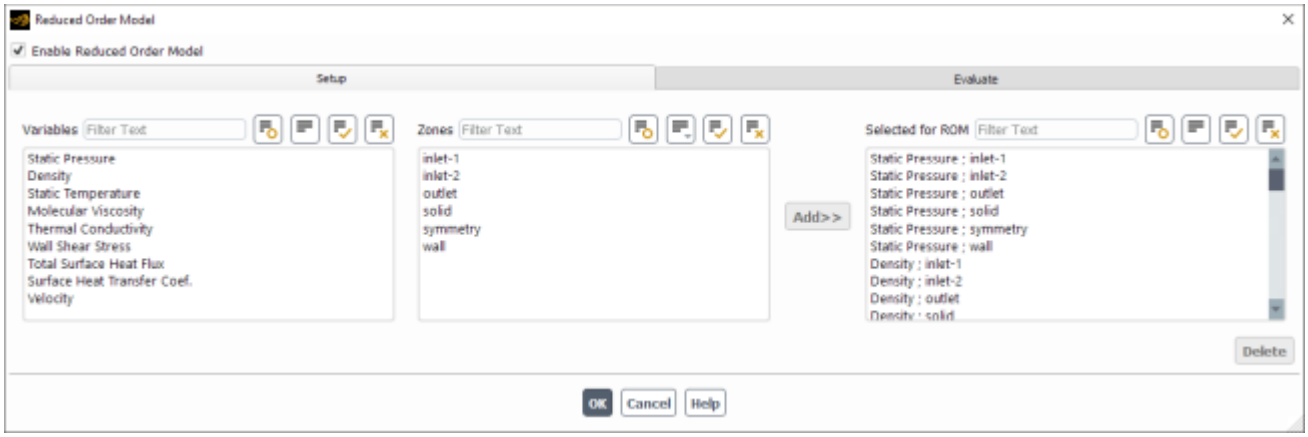
saves the current settings and displays the raytracer rendering of the active graphics window according to the specified settings.

Save

saves the raytracer settings. *This allows you to define a raytracer rendering and save a picture without displaying it in the graphics window first.*

51.2.95. Reduced Order Model Dialog Box

The **Reduced Order Model** dialog box allows you to enable the reduced order model (ROM) and select which variables and zones to include in the ROM—refer to Creating Reduced Order Models (ROMs) (p. 3547) additional information. You can also use it to evaluate a produced ROM as discussed in Reduced Order Model (ROM) Evaluation in Fluent (p. 3549).



Controls

Setup tab

Variables

lists the variables that are available for creating the ROM.

Zones

lists all of the zones in your case. You can select from this list to tell the ROM where the selected variables in the **Variables** list will be evaluated.

Add>>

adds the selected variables and zones to the ROM.

Selected for ROM

lists all of the selected variables and their associated locations for the ROM.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Delete

removes the selected variables and zones from the **Selected for ROM** list.

Evaluate tab

Parameters used for ROM creation:

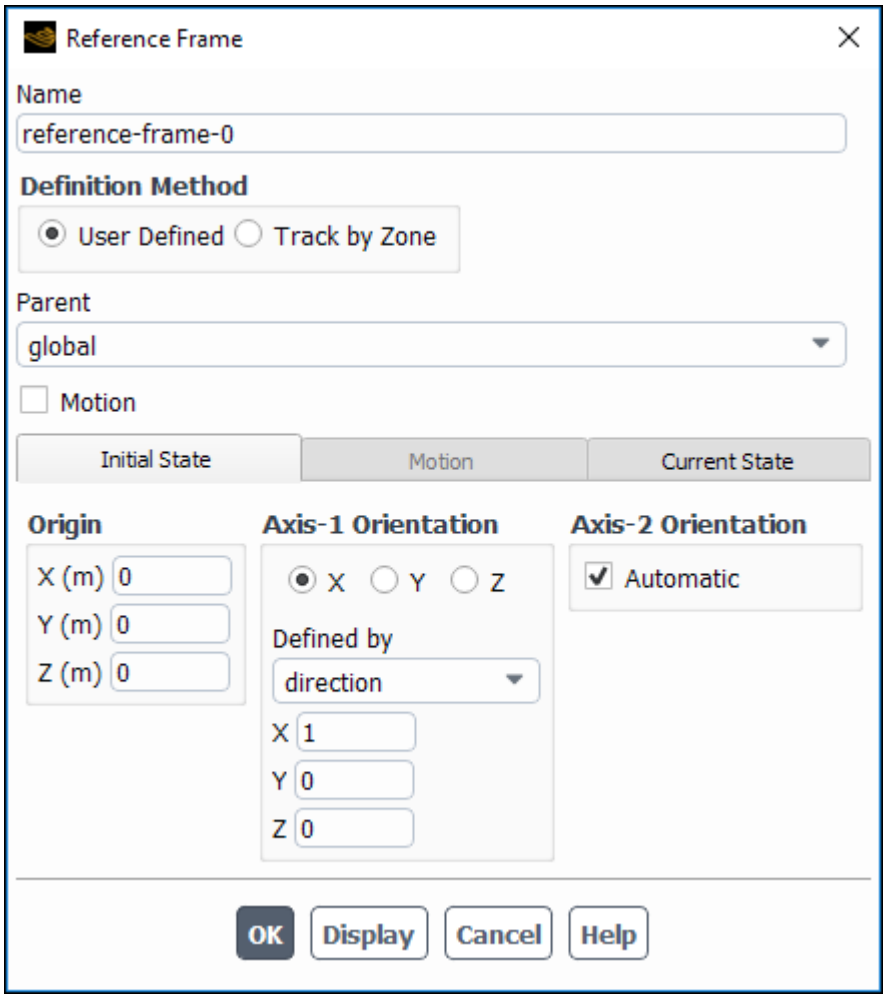
lists all of the variables that were used in creation of the reduced order model (ROM). The **Min-Max Range** on the right of the fields lists the accepted input ranges for the number entry fields.

Evaluate

evaluates the case using the values you specify for the listed parameters.

51.2.96. Reference Frame Dialog Box

The **Reference Frame** dialog box allows you to create local reference frames either with the coordinates and orientation that you specify or by tracking a cell zone. Refer to Reference Frames (p. 1140) additional information.



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Definition Method

specifies how you want to define the reference frame.

Parent (User Defined only)

specifies the parent reference frame.

Zone (Track by Zone only)

specifies which cell zone this reference frame will track.

Motion (User Defined Only)

allows you to specify a motion for this reference frame (accomplished in the **Motion** tab.

Linear Velocity (Motion tab)

is the linear velocity with respect to the parent reference frame orientation.

Rotational Velocity (Motion tab)

is the rotational velocity with respect to the parent reference frame orientation.

Rotation Axis

is the axis about which the rotational velocity will be applied.

Origin

specifies the origin of the reference frame.

Axis-1 Orientation

specifies the orientation of the selected axis.

Axis-2 Orientation

specifies the orientation of the second axis. By default Fluent does this automatically, however you can disable **Automatic** and specify the orientation manually.

Current State (tab)

shows you the current origin and axes directions of the reference frame with respect to the global reference frame.

51.2.97. Replace Cell Zone Dialog Box

The **Replace Cell Zone** dialog box allows you to replace a single cell zone or multiple zones. See Replacing Zones (p. 1252) for details.

Domain → **Zones** → **Replace Zone...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Case/Mesh File

allows you to specify a mesh file from which you want to replace the zone.

Existing Zones

contains a list of cell zones from which you can select the zone to be replaced.

Replace with

contains a list of cell zones from which you can select the zone to replace the zone selected in **Existing Zones** list.

Interpolate Data

allows you to enable/disable data interpolation if data already exists.

Replace

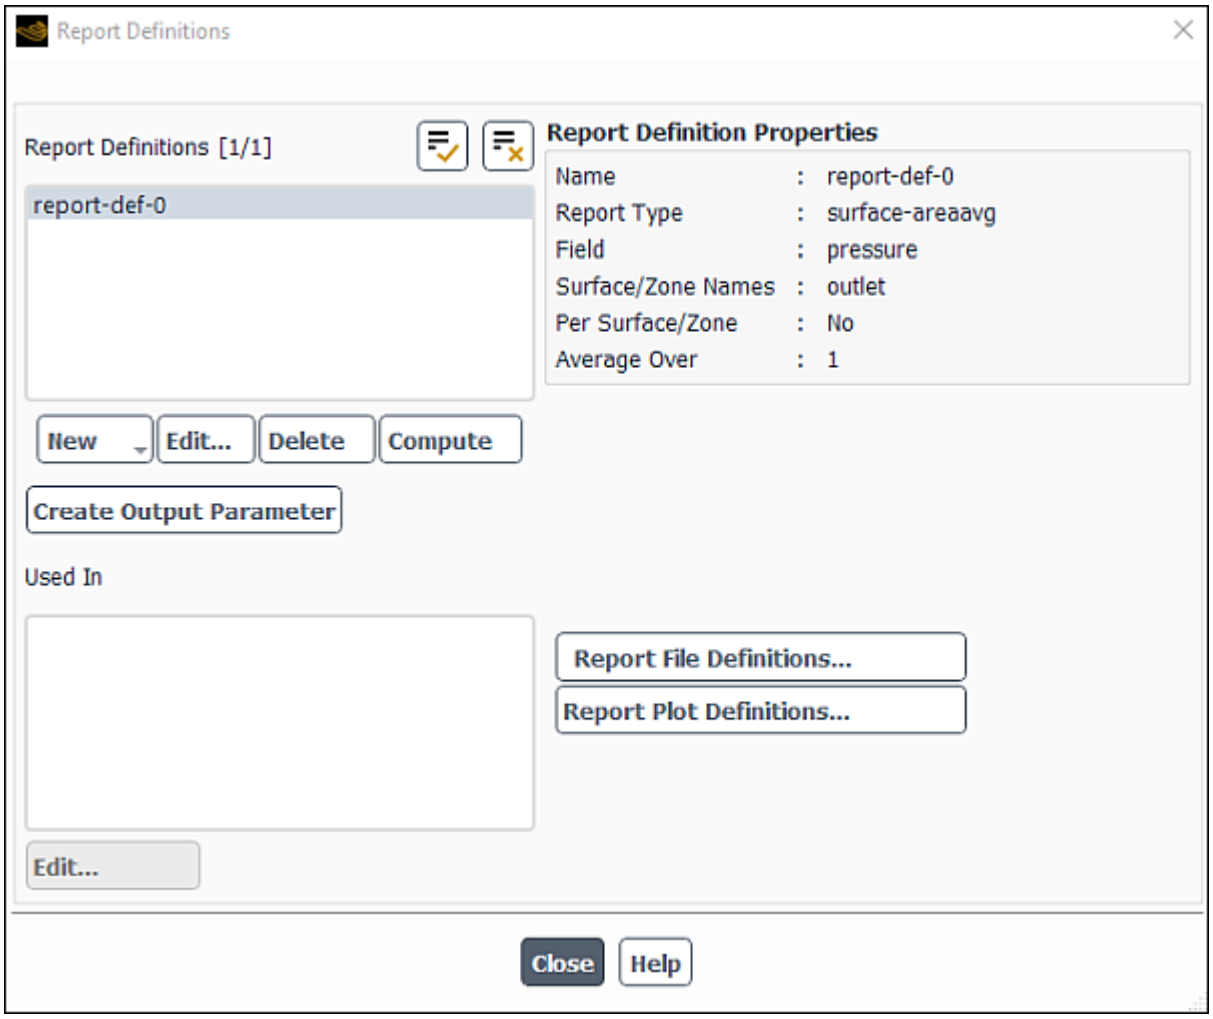
replaces the selected cell zone.

51.2.98. Report Definitions Dialog Box

Solution → **Reports** → **Definitions** → **Edit...**

For information on creating report definitions, see Monitoring and Reporting Solution Data (p. 4064).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Report Definitions

lists all of the existing report definitions.

New

drop-down list allowing you to create new report definitions (surface, volume, force, flux, mesh, aeromechanics, dpm, expression, and user-defined).

Edit...

allows you to edit the properties of the selected report definition.

Delete

deletes the selected report definition.

Compute

computes the value of the selected report definition and prints to the console.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create Output Parameter

creates an output parameter for the selected report definition(s) with the name `<report definition name>-op`.

Used In

lists the report files and report plots that contain the selected report definition.

Edit... (button)

opens the report file/plot dialog box for the report file/plot selected in the **Used In** list.

Report Definition Properties

displays the properties of the selected report definition in the **Report Definition** list.

Report File Definitions...

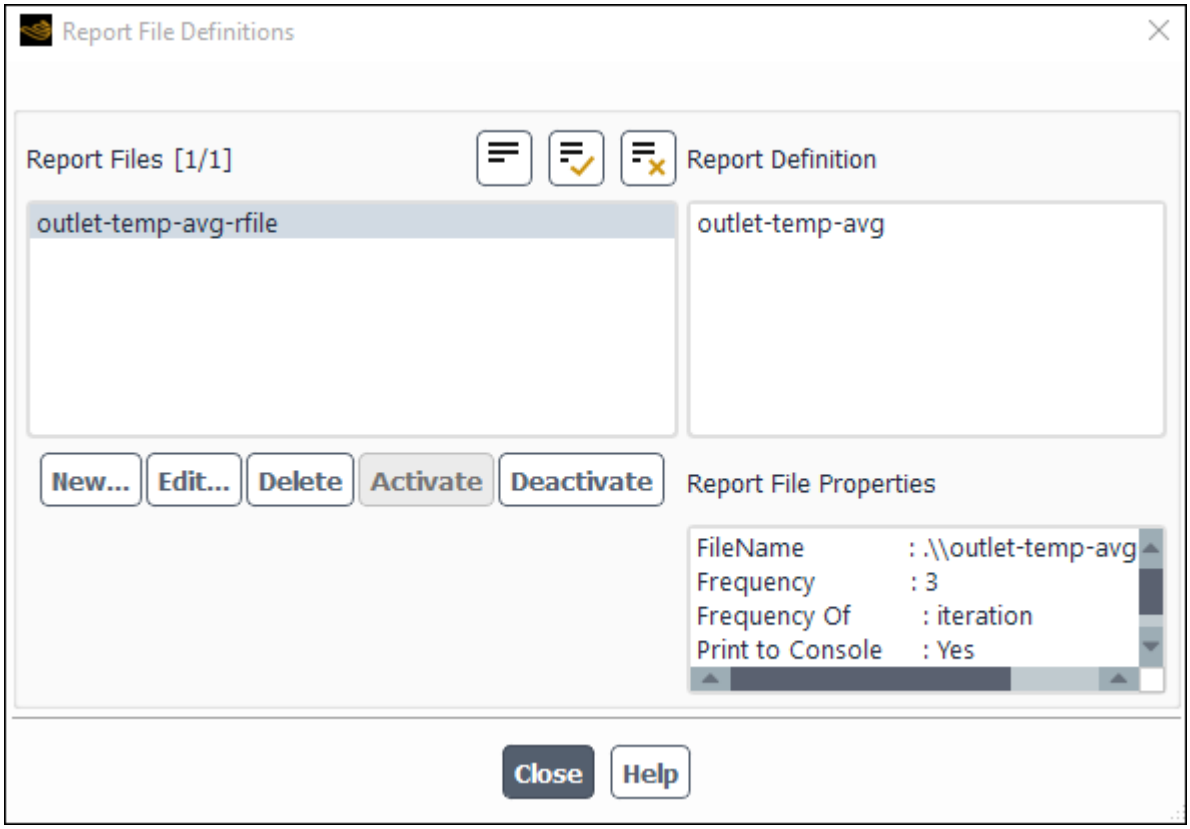
opens the Report File Definitions Dialog Box (p. 5538).

Report Plot Definitions

opens the Report Plot Definitions Dialog Box (p. 5539).

51.2.99. Report File Definitions Dialog Box

Solution → Reports → File...



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Report Files

lists all of the existing report files.

New...

opens the New Report File Dialog Box (p. 5493).

Edit...

allows you to edit the properties of the selected report file in the Edit Report File Dialog Box (p. 5400).

Delete

deletes the selected report file.

Activate

activates the selected (previously deactivated) report file for writing during the solution calculation.

Deactivate

deactivates the writing of the selected report file during the solution calculation.

Report Definition

lists the report definitions included in the selected report file.

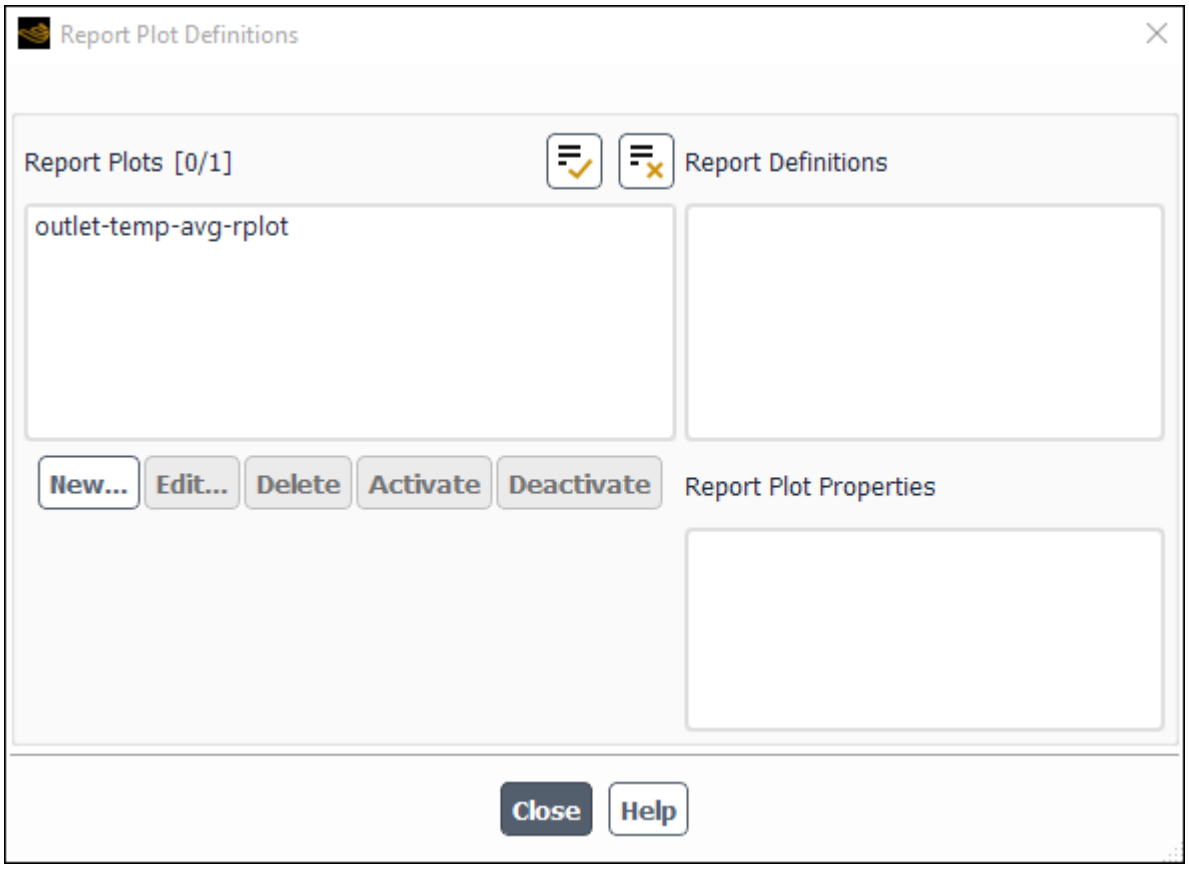
Report File Properties

lists the properties of the selected report file.

51.2.100. Report Plot Definitions Dialog Box

Solution → Reports → Plot...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Report Plots

lists all of the existing report plots.

New...

opens the New Report Plot Dialog Box (p. 5495).

Edit...

allows you to edit the properties of the selected report plot in the Edit Report Plot Dialog Box (p. 5402).

Delete

deletes the selected report plot.

Activate

activates the selected (previously deactivated) report plot for plotting during the solution calculation.

Deactivate

deactivates the plotting of the selected report plot during the solution calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Report Definition

lists the report definitions included in the selected report plot.

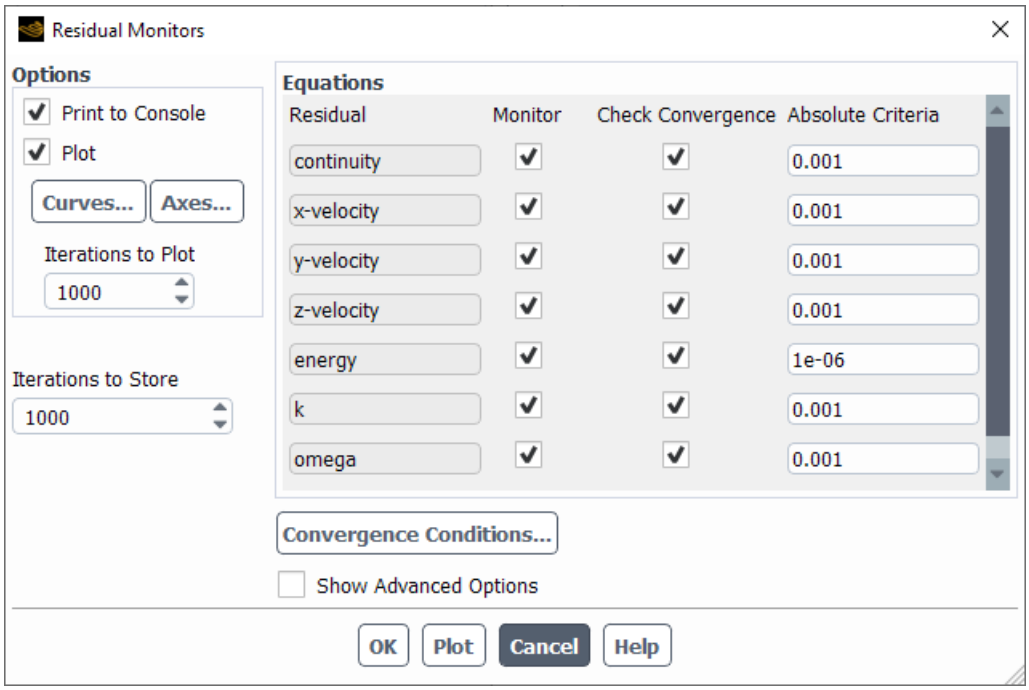
Report Plot Properties

lists the properties of the selected report plot.

51.2.101. Residual Monitors Dialog Box

You can use the **Residual Monitors** dialog box to control the residual information that Fluent reports. See Monitoring Residuals (p. 3670) for details about the items below.

Solution → Reports → Residuals...



Controls

Options

selects any combination of the following methods for reporting residuals. See Printing and Plotting Residuals (p. 3675) for details.

Print to Console

specifies whether or not to print residuals in the text window after each iteration.

Plot

specifies whether or not to plot residuals in the graphics window after each iteration. See Plot Parameters (p. 3680) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Iterations to Plot

is the number of history points to display on the residual plot.

Axes...

opens the Axes Dialog Box (p. 5259), which allows you to modify the attributes of the axes.

Curves...

opens the Curves Dialog Box (p. 5262), which allows you to modify the attributes of the residual curves.

Iteration to Store

sets the number of residual history points to be stored in the data file. Due to the compaction algorithm used, saving 1000 points does not result in just the last 1000 iterations being saved; the history reaches back quite a bit further than that, but does not save a point at every iteration. Further back in the iteration history, the spacing between saved iterations grows larger. See Storing Residual History Points (p. 3676) for details.

Convergence Conditions...

opens the Convergence Conditions Dialog Box (p. 5361).

Residual

indicates the name of each variable for which residual information is available.

Monitor

indicates whether or not the residuals for each variable are to be monitored. You can toggle monitoring on and off for each variable by turning the corresponding check box in the **Monitor** list on or off.

Normalization Factor

shows the normalization factor for each variable. The default is the maximum residual value after the first 5 iterations. To set this value manually, enter a new value in the corresponding **Normalization Factor** field. This list will not appear if the **Normalize** option is turned off.

Check Convergence

indicates whether or not the convergence of each variable is to be monitored. If convergence is being monitored, the solution will stop automatically when each variable meets its specified convergence criterion. You can check convergence only for variables for which you are monitoring residuals. You can toggle convergence checking on and off for each variable by turning the corresponding check box in the **Check Convergence** list on or off.

Absolute Criteria, Relative Criteria

shows the residual value for which the solution of each variable will be considered to be converged. To set this value manually, enter a new value in the corresponding **Absolute Criteria**/**Relative Criteria** field.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot

displays the current residual history plot.

Show Advanced Options

Residual Values

controls the normalization and scaling of residuals. See Controlling Normalization and Scaling (p. 3676) for details.

Normalize

specifies whether or not to normalize the printed or plotted residual for each variable by the value indicated as the **Normalization Factor** for that variable. The default **Normalization Factor** is the maximum residual value after the first 5 iterations.

This option is off by default.

Iterations

sets the number of iterations for which Ansys Fluent will search for the largest residual to normalize by. (If the **Normalize** option is turned off, this item will not be editable.)

Scale

specifies whether or not to print or plot scaled residuals for each variable. This option is on by default.

Compute Local Scale

computes and stores both the locally and globally scaled residuals from subsequent iterations, for the purpose of reporting. You will select the type of residual scaling form the **Reporting Option** drop-down list. See Definition of Residuals for the Pressure-Based Solver (p. 3670) and Definition of Residuals for the Density-Based Solver (p. 3672) for more information.

Reporting Option

gives you the choice of plotting or printing to the console the **global scaling** or **local scaling** of residuals.

Renormalize

sets the normalization factors to the maximum values in the residual histories. **Renormalize** should be used to renormalize the residual plot in cases where the maximum residuals occur sometime after the first five iterations.

Convergence Criterion

consists of four options that are available for checking an equation for convergence.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

absolute

is the default and is available for steady-state cases. The residual (scaled and/or normalized) of an equation at an iteration is compared with a user-specified value. If the residual is less than the user-specified value, that equation is deemed to have converged for a time step.

relative

is where the residual of an equation at an iteration of a time step is compared with the residual at the start of the time step. If the ratio of the two residuals is less than a user-specified value, that equation is deemed to have converged for a time step.

relative or absolute

is where either the **absolute** convergence criterion or the **relative** convergence criterion is met. At that point, the equation is considered converged.

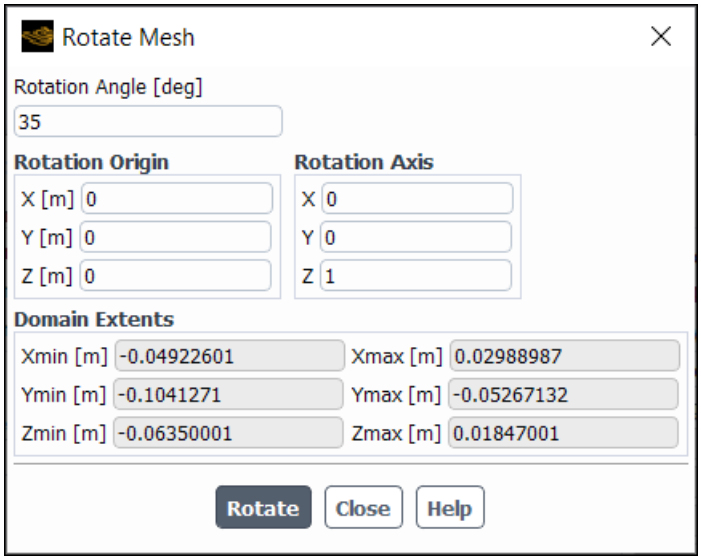
none

is used to disable convergence checking.

51.2.102. Rotate Mesh Dialog Box

The **Rotate Mesh** dialog box allows you to rotate the mesh about the required axis and rotation origin by specifying the angle of rotation. See Rotating the Mesh (p. 1266) for details.

Domain → Mesh → Transform → Rotate...



Controls

Rotation Angle

is the angle with which you want to rotate the mesh. You can enter a positive or negative real number.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Rotation Origin

defines the new origin for the mesh rotation.

Rotation Axis

defines the axis about which you want to rotate the mesh.

Domain Extents

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

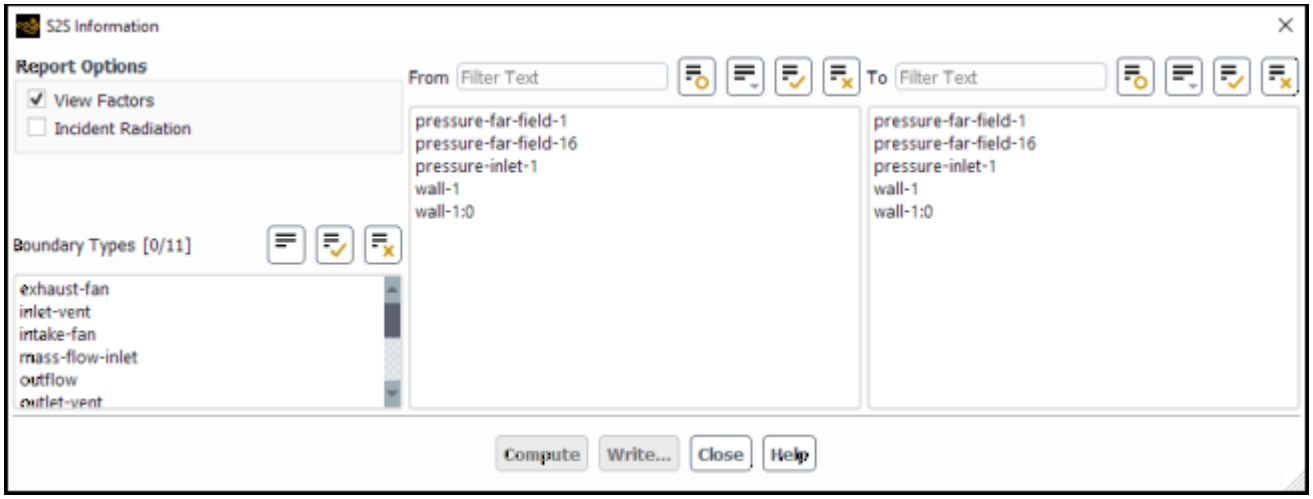
Rotate

adds the specified rotation parameters to the appropriate Cartesian coordinate of every node in the mesh.

51.2.103. S2S Information Dialog Box

The **S2S Information** dialog box allows you to report values of the view factor and radiation emitted from one zone to any other zone. See Reporting Radiation in the S2S Model (p. 2210) for details about the items below.

Results → Model Specific → S2S Information...



Controls

Report Options

contains items for which information is available for reporting.

View Factors

turns on the computation of view factors from one zone to the other.

Incident Radiation

turns on the computation of the incident radiation from one zone to the other.

Boundary Types

contains a selectable list of types of boundary zones. If you select (or deselect) an item in this list, all zones of that type will be selected (or deselected) automatically in the **From** and **To** lists.

From

contains a selectable list of boundary zones for which you would like data reported from the selected zone.

To

contains a selectable list of boundary zones for which you would like data reported to the selected zone.

Compute

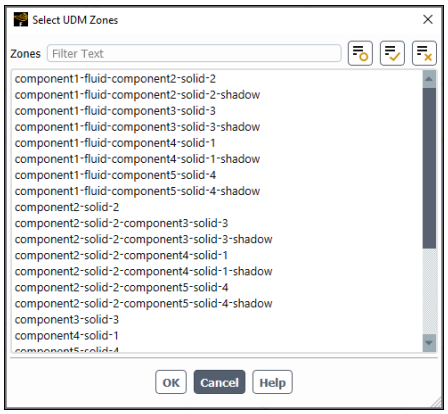
computes the view factors and/or incident radiation on the selected zones.

Write...

opens The Select File Dialog Box (p. 907), which you can use to save the data as an S2S Info File (`.sif` format).

51.2.104. Select UDM Zones Dialog Box

The **Select UDM Zones** dialog box allows you allocate user-defined memory on specific zones. This dialog box is opened by clicking **Edit...** in the User-Defined Memory Dialog Box (p. 5594).



Controls

Zones

lists the zones available for user-defined memory allocation.

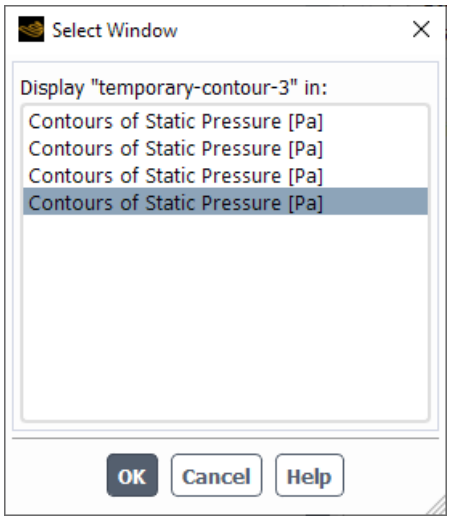
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

OK

confirms the selection of the highlighted zone(s) for user-defined memory allocation.

51.2.105. Select Window Dialog Box

The **Select Window** dialog box allows you specify the window where the specified object (accessed via right-clicking the object or boundary in the tree and selecting **Display in** → **More...** or **Add To** → **More...**) will be displayed. See Managing Multiple Graphics Windows (p. 3925) for additional information.



Controls

Display <object/boundary name> in: | Add <object/boundary name> to:

lists the available graphics windows for display. Selecting a graphics window from the list makes the window active.

OK

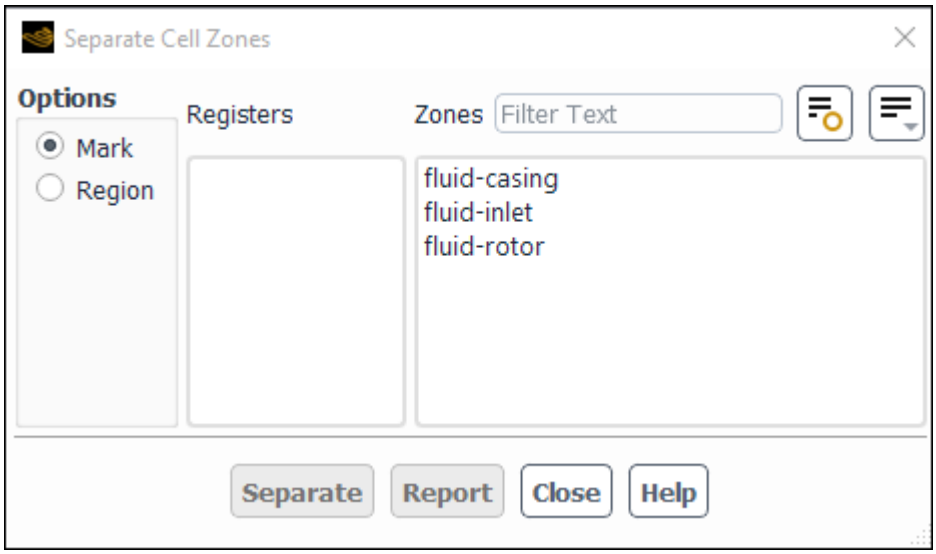
displays the specified object or boundary in the selected graphics window.

51.2.106. Separate Cell Zones Dialog Box

The **Separate Cell Zones** dialog box allows you to separate a single cell zone into multiple zones of the same type. See Separating Zones (p. 1239) for details.

Domain → **Zones** → **Separate** → **Cells...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

specifies the method on which the cell-zone separation is to be based.

Mark

indicates that the cell zone is to be separated based on the marks stored in cell registers.

Region

indicates that the cell zone is to be separated into two or more contiguous regions based on an internal boundary within the original zone.

Registers

contains a list of defined cell registers. If you are separating the cell zone by mark, select the cell register to be used in the **Registers** list. When the separation is performed, cells that are marked will be placed into a new zone.

Zones

contains a list of cell zones from which you can select the zone to be separated.

Separate

separates the selected cell zone based on the specified parameters.

Report

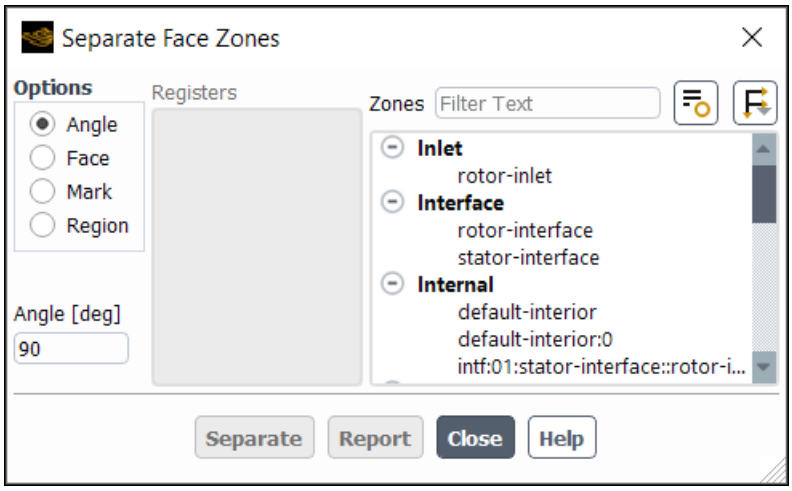
reports what the result of the separation will be without actually separating the cell zone.

51.2.107. Separate Face Zones Dialog Box

The **Separate Face Zones** dialog box allows you to separate a single face zone into multiple zones of the same type. See Separating Zones (p. 1239) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Domain → Zones → Separate → Faces...



Controls

Options

specifies the method on which the face zone separation is to be based.

Angle

indicates that the face zone is to be separated based on significant angle (specified in the **Angle** field).

Face

indicates that the face zone is to be separated by putting each face in the zone into its own zone.

Mark

indicates that the face zone is to be separated based on the marks stored in cell registers.

Region

indicates that the face zone is to be separated based on contiguous regions.

Registers

contains a list of defined cell registers. If you are separating faces by mark, select the cell register to be used in the **Registers** list. When the separation is performed, all faces of cells that are marked will be placed into a new face zone.

Zones

contains a list of face zones from which you can select the zone to be separated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Angle

specifies the significant angle to be used when you separate a face zone based on angle. Faces with normal vectors that differ by an angle greater than or equal to the specified significant angle will be placed in different zones when the separation occurs.

Separate

separates the selected face zone based on the specified parameters.

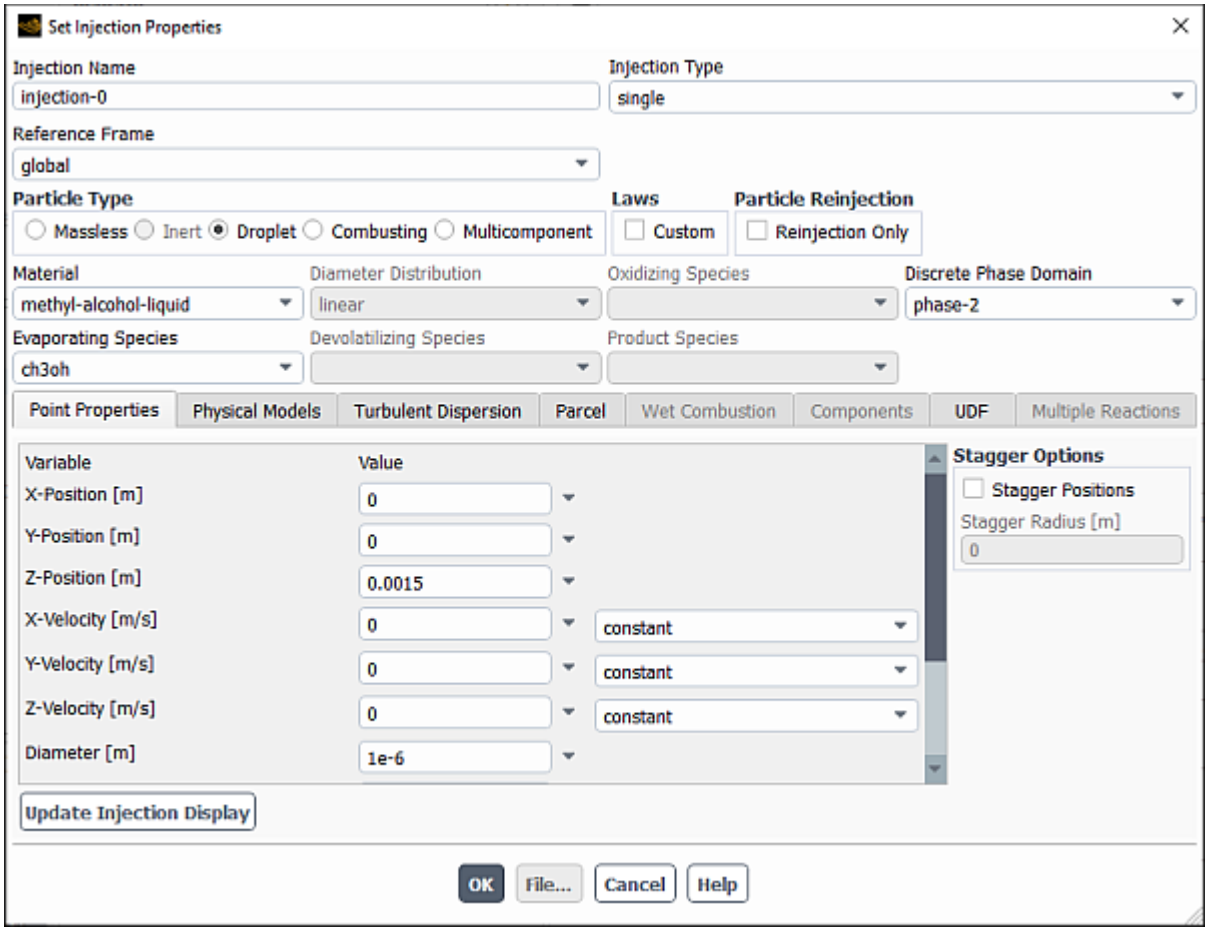
Report

reports what the result of the separation will be without actually separating the face zone.

51.2.108. Set Injection Properties Dialog Box

The **Set Injection Properties** dialog box allows you to define the properties of an existing discrete-phase injection (which was created in the Injections Dialog Box (p. 5440)). See Defining Injection Properties (p. 2753) for details about the items listed in this section.

The **Set Injection Properties** dialog box is opened from the Injections Dialog Box (p. 5440).



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Injection Name

sets the name of the injection.

Injection Type

contains a drop-down list of the available injection types: **single**, **group**, **cone**, **surface**, **volume**, **plain-orifice-atomizer**, **pressure-swirl-atomizer**, **air-blast-atomizer**, **flat-fan-atomizer**, **effer-vescent-atomizer**, and **file**. (**cone** is not available in 2D.) These choices are described in Injection Types (p. 2718).

Number of Streams

indicates the number of particle streams in a group, cone, or atomizer injections, or surface injections with the **Randomize Starting Points** option. (This item will not appear for single, volume, or file injections, or surface injections without the **Randomize Starting Points** option.)

Reference Frame

is a drop-down list where you can select the reference frame for the injection point properties. By default, the global reference frame is used. This item is not available for surface, volume, and condensate injections.

Injection Surfaces

is where you can select the surface(s) from which the particles in a **surface** injection will be released. This item will appear only for a **surface** injection.

Release From

is where you can select either the **zone** or **bounding-geometry** particle release region. This item will appear only for a **volume** injection.

Zones

is where you can select the zone(s) from which the particles in a **volume** injection will be released. This item will appear only when **zone** is selected from the **Release From** drop-down list.

Bounding Shape

is a drop-down list where you can select **sphere**, **cylinder**, **cone**, or **hexahedron** to model the particle release region. This item will appear only when **bounding-geometry** is selected from the **Release From** drop-down list.

Shape Coordinates

designates the coordinates to define the geometry of the selected bounding shape. See Defining Injection Properties (p. 2753) for more information. This item will appear only when **bounding-geometry** is selected from the **Release From** drop-down list.

Parcel Specification

specifies the number of particle parcels to be injected. You can choose either the **number-of-starting-points** or **parcels-per-cell** specification method. See Defining Injection Properties (p. 2753)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

for details. This item appears only for a **volume** injection and is not available for DDPM cases with the **Discrete Phase Domain** setting other than **none**.

Injection Packing Limit per Cell

specifies the highest particle volume fraction that is possible in a computational cell. See Defining Injection Properties (p. 2753) for details. This item appears only for a **volume** injection when the DDPM with the **Discrete Phase Domain** setting other than **none** is used.

Particle Type

specifies the particle type as **Massless**, **Inert**, **Droplet**, **Combusting**, or **Multicomponent**. These types are described in Particle Types (p. 2720).

Laws

(not for massless particles) contains inputs for customized particle laws.

Custom

enables the specification of customized particle laws and opens the Custom Laws Dialog Box (p. 5373).

Reinjection Only

(unsteady particle tracking only) specifies whether the injection is used only for reinjecting particles as described in The **reinject** Boundary Condition (p. 2781).

Material

(not for massless particles) indicates the material for the particles. If this is the first time you have created a particle of this type, you can choose from all of the materials by copying them from the database or creating them from scratch, as discussed in Setting Discrete-Phase Physical Properties (p. 2811) and described in detail in Using the **Create/Edit Materials** Dialog Box (p. 1573).

Diameter Distribution

(not for massless particles) allows you to select one of the following interpolation methods for determining the size of the particles:

- **linear** (default, **group** injections only)
- **uniform** (default, **surface** and **volume** injections only)
- **rosin-rammler**
- **rosin-rammler-logarithmic**
- **tabulated** (**cone**, **surface** or **volume** injections only)

  Selecting **tabulated** opens the **Association of Particle Size Distribution Data** dialog box.

See Using the Rosin-Rammler Diameter Distribution Method (p. 2742) and Using the Tabulated (Discrete) Diameter Distribution (p. 2746) for more information on the Rosin-Rammler method and the tabulated method, respectively.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Evaporating Species

(for **droplet** particles) specifies the gas-phase species created by the vaporization and boiling laws (laws 2 and 3).

Devolatilizing Species

(for **combusting** particles) specifies the gas-phase species created by the devolatilization law (law 4).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

Devolatilizing Stream

(for **combusting** particles) specifies the destination stream for the gas-phase species created by the devolatilization law (law 4).

This item will appear only for two-mixture-fraction non-premixed combustion calculations.

Oxidizing Species

(for **combusting** particles) specifies the gas phase species that participates in the surface char combustion reaction (law 5).

Product Species

(for **combusting** particles) specifies the gas-phase species created by the surface char combustion reaction (law 5).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

Product Stream

(for **combusting** particles) specifies the destination stream for the gas-phase species created by the surface char combustion reaction (law 5).

This item will appear only for two-mixture-fraction non-premixed combustion calculations.

Discrete Phase Domain

is available when using the **Dense Discrete Phase Model**, described in Including the Dense Discrete Phase Model (p. 3101).

DEM Collision Partner

is available when using the **DEM Collision** model, described in Modeling Collision Using the DEM Model (p. 2699).

Point Properties

displays the inputs for the point properties for the injection (for example, position, velocity, diameter, temperature, mass flow rate, and stagger options). These inputs are described for each injection type in Point Properties for Single Injections (p. 2722) – Point Properties for Effervescent Atomizer Injections (p. 2739).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stagger Options

allows you to set the stagger options:

Stagger Positions

enables injection-specific spatial staggering of the particles.

Stagger Radius

specifies the region from which particles are released. This item is available only for non-atomizer injections.

Stagger in Injection Plane Only

when enabled, restricts the spatial staggering of the initial particle positions to purely the radial direction of the spray. The spatial staggering clusters the initial particle positions about the outer radius of the hollow cone using a Gaussian distribution with 0 mean and +/- 2 standard deviation. This item is available only for **hollow-cone** injections.

Surface Options

(surface injections only) allows you to select the following options:

Scale Flow Rate by Face Area

scales the individual mass flow rates of the particles by the ratio of the area of the face they are released from to the total area of the surface.

Inject Using Face Normal Direction

uses the surface normal for the injection direction. When this option is selected, you need to specify only the velocity magnitude of the injection, not the individual components of the velocity magnitude.

Randomize Starting Points

when this option is selected, particles are injected from positions distributed randomly over the selected boundary surfaces.

Wallfilm

(surface injections only) is where you can select the **Inject Wallfilm Particles** option if you want to inject wall film particles from surfaces. This item is available for unsteady particle tracking only.

First Point

specifies the first point properties for the injection. This item appears only for group injections.

Last Point

specifies the last point properties for the injection. This item appears only for group injections.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Update Injection Display

applies the current point property settings to the injection graphics windows so that you can preview the effect of modified settings before saving the injection. This item is not available for **surface**, **volume**, **file**, and **condensate** injection types.

Use Mass Instead of Flow Rate

When selected, you can specify the **Total Mass** instead of the default **Total Flow Rate** of the parcel to be injected into the particle release region. This item is available only for the **volume** injection type.

Physical Models

displays the inputs for injection-specific physics models.

Drag Parameters

allows the setting of the drag law used in calculating the force balance on the particles. See Particle Force Balance in the Theory Guide for details on the items below.

Drag Law

is a drop-down list containing the available choices for the drag law:

spherical

assumes that the particles are smooth spheres.

nonspherical

assumes that the particles are not spheres, but are all identically shaped. The shape is specified by the **Shape Factor**.

Stokes-Cunningham

is for use with sub-micron particles. A **Cunningham Correction** is added to Stokes' drag law to determine the drag.

high-Mach-number

is similar to the spherical law with corrections to account for a particle Mach number greater than 0.4 or a particle Reynolds number greater than 20.

Ishii-Zuber

is used in gas-liquid flows. This drag law is only available if the magnitude and direction of the gravity vector are specified in the **Operating Conditions** dialog box. See Ishii-Zuber Drag Model in the *Fluent Theory Guide* for details.

Grace

is used in gas-liquid flows. This drag law is only available if the magnitude and direction of the gravity vector are specified in the **Operating Conditions** dialog box. See Grace Drag Model in the *Fluent Theory Guide* for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

dynamic-drag

accounts for the effects of droplet distortion. This drag law is available only when one of the droplet breakup models is used in conjunction with unsteady tracking. See Dynamic Drag Model Theory in the Theory Guide for details.

Shape Factor

specifies the shape of the particles when **nonspherical** is selected as the **Drag Law** (φ in Equation 12.52 in the Theory Guide). It is the ratio of the surface area of a sphere having the same volume as the particle to the actual surface area of the particle. The shape factor value cannot be greater than 1.

Cunningham Correction

(C_c in Equation 12.55 in the Theory Guide) is used with Stokes' drag law to determine the force acting on the particles when the particles are sub-micron size. It appears when **Stokes-Cunningham** is selected as the **Drag Law**.

Wen-Yu

uses the fluid-solid drag function of Wen and Yu described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this option. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Gidaspow

uses the Gidaspow formulation described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Huilin-Gidaspow

uses the Huilin-Gidaspow function described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Syamlal-OBrien

uses the Syamlal-O'Brien model described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Gibilaro

uses the Gibilaro model described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EMMS

uses the energy-minimization multi-scale (EMMS) drag model described in Fluid-Solid Exchange Coefficient in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Filtered

uses the filtered Two-Fluid Model (TFM) described in The Filtered Two-Fluid Model in the *Fluent Theory Guide*. See Specifying the Drag Function (p. 3070) for recommendations on the usage of this drag law. This drag law is available only when the dense discrete phase model (DDPM) is enabled.

Heat Transfer Coefficient

is a drop-down list from which you can select the heat transfer model for your simulation. See Heat Transfer Coefficient (p. 2763) for a full description of available models and their usage.

Particle Rotation

contains settings for the modeling of particle rotation when the **Enable Rotation** check box is selected (see Wall-Particle Reflection Model Theory in the *Fluent Theory Guide*).

Rotational Drag Law

is a drop-down list of available rotational drag law models:

Dennis-et-al

uses Equation 12.67 in the *Fluent Theory Guide* to calculate the rotational drag coefficient C_ω.

none

implies zero torque, that is, it excludes the influence of the fluid on the rotational particle motion.

Magnus Lift Law

is a drop-down list of available Magnus lift law models:

Oesterle-Bui-Dinh

uses Oesterle and Bui Dinh's formulation (Equation 12.18 in the *Fluent Theory Guide*).

Tsuji-et-al

is based on the particle spin rate (Equation 12.19 in the *Fluent Theory Guide*).

Rubinow-Keller

uses a linear dependence of the rotational lift coefficient C_{RL} on the spin rate (Equation 12.21 in the *Fluent Theory Guide*).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

none

implies that the Magnus lift will not be included in your simulation.

Brownian Motion

enables the incorporation of the effects of Brownian motion. This option is available only when the **Energy** equation is enabled (in the **Models** group) and the **Stokes-Cunningham** drag law is selected from the **Drag Law** drop-down list. See Brownian Force in the Theory Guide for details.

Breakup

contains parameters that control droplet breakup and collision. (This section of the dialog box appears only if **Unsteady Tracking** is enabled in the Discrete Phase Model Dialog Box (p. 4793).) See Breakup (p. 2766) for more information.

Enable Breakup

enables breakup for this injection.

Breakup Model

is a drop-down list containing parameters that control droplet breakup. (This item appears only if **Enable Breakup** is selected.)

TAB

enables the Taylor Analogy Breakup (TAB) model, which is applicable to many engineering sprays. This method is based upon Taylor's analogy between an oscillating and distorting droplet and a spring mass system. See Taylor Analogy Breakup (TAB) Model in the Theory Guide for details.

For the **TAB** model, you must specify the following constants:

y0

is the constant y_0 in Equation 12.408 in the Theory Guide.

Breakup Parcels

is the number of child parcels the droplet is split into, as described in Velocity of Child Droplets in the Theory Guide.

Wave

enables the Wave breakup model, which considers the breakup of the injected liquid to be induced by the relative velocity between the gas and liquid phases. See Wave Breakup Model for details.

For the **Wave** model, you must specify the following constants:

B0

is the constant B_0 in Equation 12.435 in the Theory Guide.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B1

is the constant B_1 in Equation 12.437 in the Theory Guide.

KHRT

enables the Kelvin-Helmholtz Rayleigh-Taylor breakup model, which considers the two competing effects of aerodynamic breakup and instabilities due to droplet acceleration. See KHRT Breakup Model in the Theory Guide for details.

For the **KHRT** model, you must specify the following constants:

B0

is the constant B_0 in Equation 12.435 in the Theory Guide.

B1

is the constant B_1 in Equation 12.437 in the Theory Guide.

Ctau

is the constant C_τ in Equation 12.442 in the Theory Guide.

CRT

is the constant C_{RT} in Equation 12.443 in the Theory Guide.

CL

is the constant C_L in Equation 12.438 in the Theory Guide.

SSD

enables the stochastic secondary droplet breakup model, where the probability of breakup is independent of the parent droplet size and the secondary droplet size is sampled from an analytical solution of the Fokker-Planck equation for the probability distribution. See Stochastic Secondary Droplet (SSD) Model in the Theory Guide for details.

For the **SSD** model, you must specify the following constants:

Critical We

is the critical Weber number in Equation 12.444 in the Theory Guide.

Core B1

is B in Equation 12.445 in the Theory Guide.

Target Np

is the average number in parcels for daughter parcels.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Xi

is $\langle \xi \rangle$ in Equation 12.446 in the Theory Guide.

Madabhushi

Enables the Madabhushi breakup model. This model is available only with single, group, or cone (solid cone) injections. Solid cone injection is recommended. For more information about the Madabhushi breakup model, see Madabhushi Breakup Model in the *Fluent Theory Guide*.

For the **Madabhushi** model, you must specify the following constants:

B0

is the constant B_0 in Equation 12.435 in the Theory Guide. The recommended value is 2.44.

B1

is the constant B_1 in Equation 12.437 in the Theory Guide. The recommended value is 10.

Jet Diameter

is the nozzle orifice exit diameter.

Ligament Factor

Adjusts the diameter of the child droplets arising from the column breakup mechanism

C0

is the column breakup time constant. The value recommended for the Madabhushi breakup model is 3.44.

Column Drag Cd

is the constant drag coefficient for calculating the drag force acting on droplets within the liquid column.

Breakup Max Generation

is the maximum number of child parcel generations.

Subsequent Statistical Breakup

when enabled, the droplet breakup mechanism switches to the subsequent statistical breakup model after the **Breakup Max Generation** is reached. No child parcels are created during the breakup mechanism. Instead, the particle number in the parcel is increased, and the particle diameter is adjusted in such a way as to conserve the full filling mass of the parent parcel.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Schmehl

Enables the Schmehl breakup model. For more information about the Schmehl breakup model, see Schmehl Breakup Model in the *Fluent Theory Guide*.

For this model, you can specify the following settings:

Breakup Parcels

is the number of child parcels generated after splitting the droplet as described in Schmehl Breakup Model in the *Fluent Theory Guide*.

Breakup Max Generation

is the maximum number of child parcel generations.

Subsequent Statistical Breakup

when enabled, the droplet breakup mechanism switches to the subsequent statistical breakup model after the **Breakup Max Generation** is reached.

Turbulent Dispersion

displays the inputs for stochastic tracking.

Stochastic Tracking

controls the stochastic tracking for turbulent flows. Stochastic tracking includes the effect of turbulent velocity fluctuations on the particle trajectories using the DRW model described in Stochastic Tracking in the Theory Guide. See Stochastic Tracking (p. 2769) for details about the items below.

Discrete Random Walk Model

includes the effect of instantaneous turbulent velocity formulations on the particle trajectories through stochastic method.

Random Eddy Lifetime

specifies that the characteristic lifetime of the eddy is to be random.

Number of Tries

controls the inclusion of turbulent velocity fluctuations.

An input of 1 or greater tells Ansys Fluent to include turbulent velocity fluctuations in the particle force balance.

Time Scale Constant

is C_L in Equation 12.24 in the Theory Guide. The default is 0.15; if you use the RSM, a value of 0.3 is recommended.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parcel

displays the inputs for controlling the discrete phase parcels. This tab is not available for volume injections when the DDPM with the **Discrete Phase Domain** option is used.

Parcel Definitions

contains settings for how parcels are defined

Parcel Release Method

specifies the method for releasing parcels. Available settings are **standard**, **constant-number**, **constant-mass**, and **constant-diameter**. See Steady/Transient Treatment of Particles (p. 2677) for details about these settings.

Wet Combustion

displays the inputs for the wet combustion model.

Wet Combustion Model

allows the combusting particles to include an evaporating/boiling material.

Liquid Material

contains a drop-down list of liquid materials that can be chosen as the evaporating/boiling material to be included with the combusting particles.

Liquid Fraction

sets the volume fraction of the liquid present in the particle.

Components

contains the inputs for the **Multicomponent** particle type. For details on the following items, see Defining Injection Properties (p. 2753). This item is available only when **Multicomponent** is selected as **Particle Type**.

Multicomponent Settings

contains the multicomponent injections.

Component

specifies the component that is a part of the multicomponent species.

Mass Fraction

specifies the mass fraction of the component in a multicomponent species.

Evaporating Species

specifies the gas-phase species to be evaporated.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Evaporating Stream

specifies the source stream from which the species will be evaporated. This item appears only when the non/partially-premixed model is used in the case setup.

UDF

displays the inputs for **User-Defined Functions** for use in the definition of the particle injection. For details about user-defined functions, see the separate Fluent Customization Manual.

Initialization

contains a drop-down list of available user-defined functions. The UDF that you choose will be used to modify the injection properties at the time the particles are injected into the domain.

Heat/Mass Transfer

allows you to select the user-defined function that defines the heat or mass transfer.

Multiple Reactions

displays the inputs for **Multiple Surface Reactions**. See Combusting Particle Surface Reactions (p. 2404) for details about this model.

Species Mass Fractions

specify the combustible fraction of the combusting particle if you have defined more than one particle surface species. See Using the Multiple Surface Reactions Model for Discrete-Phase Particle Combustion (p. 2406) for details.

File...

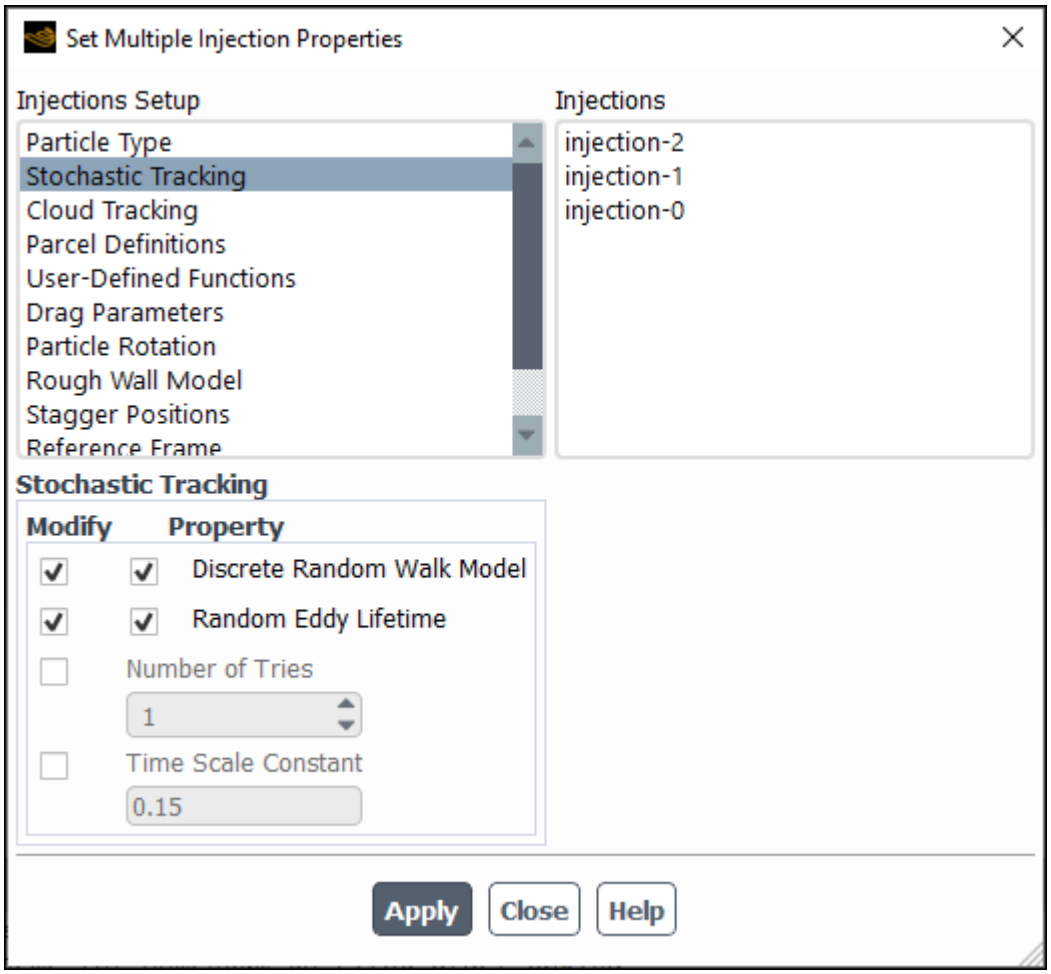
opens The Select File Dialog Box (p. 907), in which you can select a file containing the injection definition (when **file** is selected as the **Injection Type**).

51.2.109. Set Multiple Injection Properties Dialog Box

The **Set Multiple Injection Properties** dialog box allows you to set properties that are common to multiple injections. See Defining Properties Common to More than One Injection (p. 2772) for details about the items below.

The **Set Multiple Injection Properties** dialog box is opened from the Injections Dialog Box (p. 5440).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Injections Setup

contains a list of the categories of injection properties that you can set for the injections in the **Injections** list. These categories correspond to the categories of inputs in the Set Injection Properties Dialog Box (p. 5550). When you select an item in the **Injections Setup** list, the dialog box will expand to show the relevant inputs, which are the same as those in the **Set Injection Properties** dialog box.

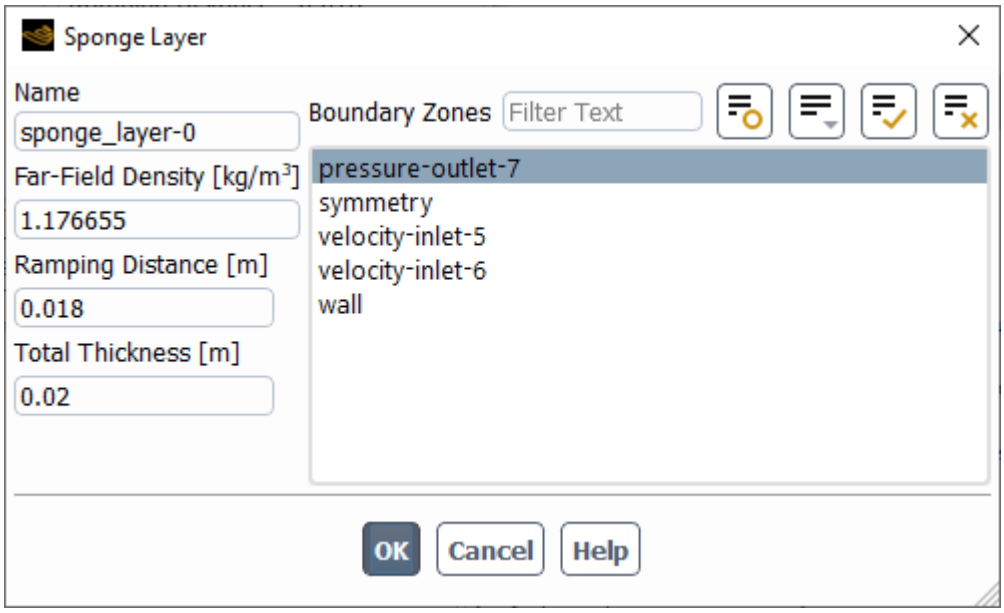
Injections

displays an informational list of the injections for which you are setting common properties. These are the injections that you selected in the Injections Dialog Box (p. 5440).

51.2.110. Sponge Layer Dialog Box

The **Sponge Layer** dialog box creates or edits a sponge layer definition, which can be used to eliminate non-physical pressure wave reflections from boundary zones in transient simulations of compressible flows with the pressure-based solver, by blending the density from the value calculated by the solver to a user-specified far-field value in the domain near one or more specified boundary zones. It is opened by clicking **New...** or by making a selection from the **Sponge Layers** list and clicking **Edit...** in the Manage Sponge Layers Dialog Box (p. 5463). For further details, see Sponge Layers (p. 2665).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the sponge layer definition.

Far-Field Density

specifies a value of density that is used for blending with the solver value within the sponge layer. It is recommended that you use the average density at the boundaries throughout the simulation.

Ramping Distance

specifies a distance within the sponge layer over which the density changes from the solver value to the far-field value. It is recommended that this distance is 80–100% of the **Total Thickness**.

Total Thickness

specifies the total thickness of the sponge layer, a distance from the selected boundaries to the interior boundary of the sponge layer. It is recommended that this thickness is at least twice the wavelength of the expected pressure waves.

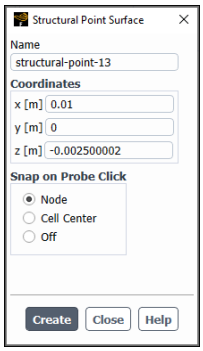
Boundary Zones

contains a list of available boundary zones on which the sponge layer can be applied.

51.2.111. Structural Point Surface Dialog Box

The **Structural Point Surface** dialog box allows you to interactively create structural point surfaces (surfaces containing a single data point). See Structural Point Surfaces (p. 3805) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Reference Frame

allows you to specify a local reference frame (if defined) for the point surface.

Coordinates

designates the coordinates of the point in the surface (**x0**, **y0**, **z0**).

Snap on Probe Click

updates the coordinates of the point to the closest **Node** or **Cell Center** when you click on the model in the graphics window using the probe tool—*that is, either by right-clicking or setting the left-mouse-button to probe (* *)*.

You can disable automatic snapping by selecting **Off**.

Create

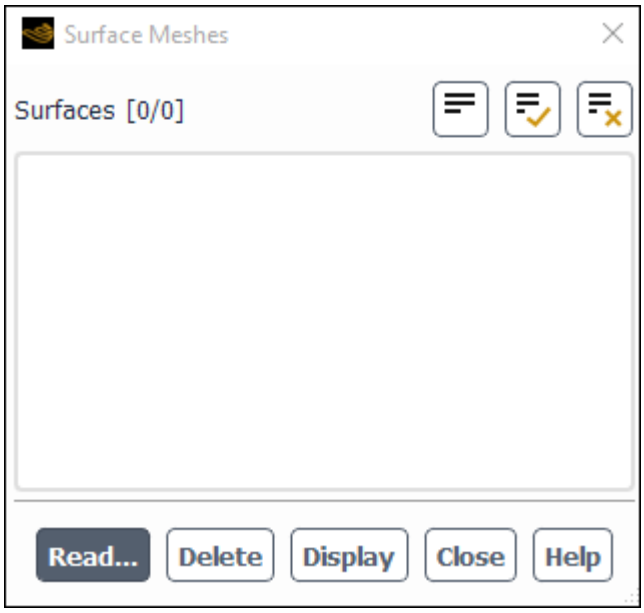
creates the surface.

51.2.112. Surface Meshes Dialog Box

The **Surface Meshes** dialog box allows you to read the surface meshes in Ansys Fluent (See Reading Surface Mesh Files (p. 1138) for details on reading surface meshes.)

The **Surface Meshes** dialog box is opened from the Geometry Based Adaption Dialog Box (p. 5435).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Surfaces

contains a list of the surfaces available in the surface mesh you read.

*You can select/deselect the surfaces listed under **Surfaces**.*

Read...

opens the **Select File** dialog box in which you can select the surface mesh you want to read.

Delete

allows you to delete the selected surfaces under **Surfaces** area.

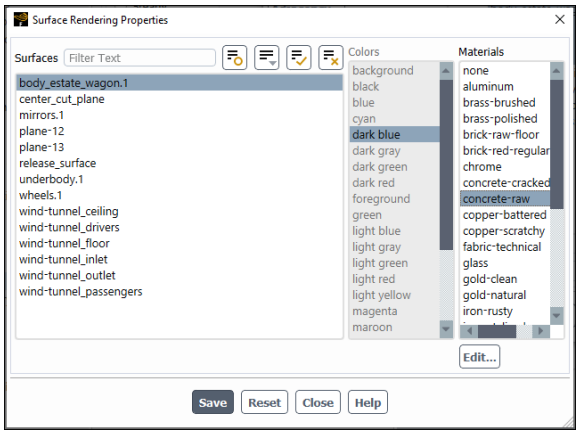
Display

allows you to display the selected surfaces under **Surfaces**.

51.2.113. Surface Rendering Properties Dialog Box

The **Surface Rendering Properties** dialog box is opened by clicking **Edit...** when **By Surface** is selected for **Coloring** in the Mesh Display Dialog Box (p. 4636).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Surfaces

contains a list of the surfaces where you can specify a color and/or material for rendering purposes.

Colors

contains a list of the colors that you can apply to the surfaces selected in the **Surfaces** list.

Materials

lists the available materials that may be used to color the surfaces selected in the **Surfaces** list. Click **Edit** if you want to modify a material's color or other properties. *See Creating Custom Realistic Materials (p. 3867) for additional information.*

Edit

opens the Material Editor Dialog Box (p. 5465).

Save

Saves all specified surface and color/material assignments.

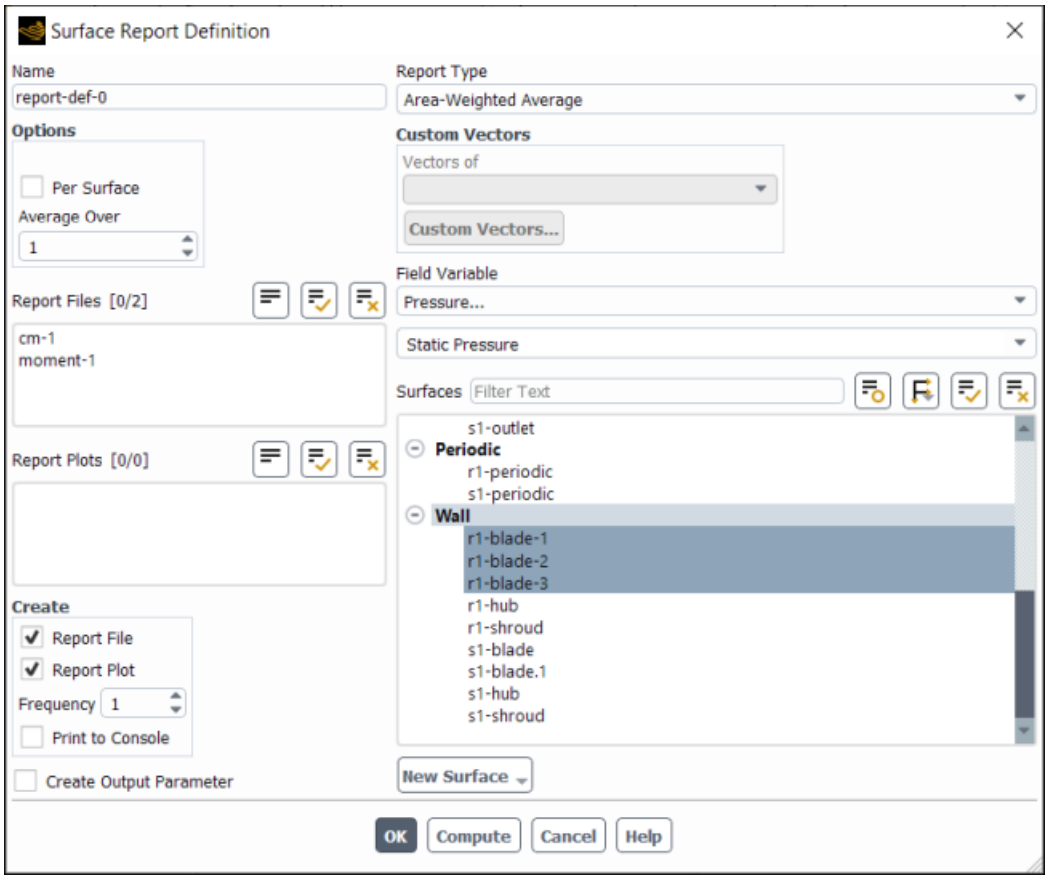
Reset

Resets all color and/or material assignments back to the default colors.

51.2.114. Surface Report Definition Dialog Box

Solution → Reports → Definitions → New → Surface Report

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

Per Surface

specifies whether or not the chosen field variable is calculated from all of the selected surfaces combined (default) or individually on each of the selected surfaces.

Average Over

(optional) To have Fluent calculate a running average for the **Surface Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than `1`. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Report Type

selects the integration method used on the selected surfaces. The available report types are the same as those in the Surface Integrals Dialog Box (p. 5271). See Surface Integration (p. 4116) for details.

Custom Vectors

allows you to specify a vector if you selected **Custom Vector Based Flux**, **Custom Vector Flux** or **Custom Vector Weighted Average** from the **Report Type** drop-down list.

Field Variable

contains a list of solution variables that can be monitored on the selected surfaces. This list will not be available if you select **Mass Flow Rate** or **Volume Flow Rate** as the **Report Type**.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Phase

contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Surfaces

contains a selectable list of the current surfaces.

New Surface

is a drop-down list button that contains a list of surface options:

Point

opens the Point Surface Dialog Box (p. 5525).

Line/Rake

opens the Line/Rake Surface Dialog Box (p. 5458).

Plane

opens the Plane Surface Dialog Box (p. 5523).

Quadric

opens the Quadric Surface Dialog Box (p. 5527).

Iso-Surface

opens the Iso-Surface Dialog Box (p. 5445).

Iso-Clip

opens the Iso-Clip Dialog Box (p. 5444).

Structural Point

opens the Structural Point Surface Dialog Box (p. 5565).

OK

creates the report definition.

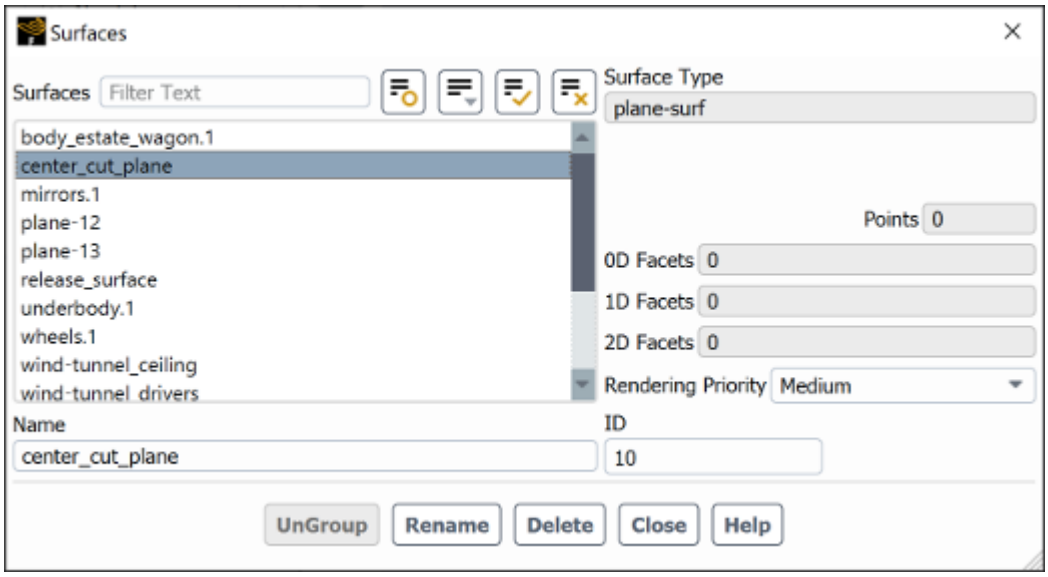
Compute

computes the value of the report definition at the selected surface(s) and prints to the console.

51.2.115. Surfaces Dialog Box

The **Surfaces** dialog box allows you to interactively group, rename, and delete surfaces and obtain information about their components. See Grouping, Prioritizing, Editing, Renaming, and Deleting Surfaces (p. 3827) for details about the items below.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Surfaces

contains a list of existing surfaces from which you can select the surface(s) of interest.

Name

displays the name of the selected surface. You can edit the text field to modify the surface name. (If more than one surface is selected, the name of the first one you selected will be displayed.)

Surface Type

displays the type of surface that is selected (for example, `zone-surf` if one surface is selected, or `Multiple Surfaces` if more than one surface is selected).

Points, 0D Facets, 1D Facets,

and **2D Facets** display the number of points and facets in the selected surface. If more than one surface is selected, the sum over all selected surfaces is displayed for each quantity.

Note that if you want to check these statistics for a surface that was read from a case file, you will need to first display it.

Rendering Priority

specifies the rendering priority for the selected surface, which determines which surface will be seen when there are coincident surfaces within a display.

ID

displays the ID of the selected surface. You cannot change this value.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UnGroup

ungroups the selected surface. This button is available only if the selected surface was created by **Group**ing two or more surfaces together.

Rename

renames the selected surface in **Surfaces** with the name specified in **Name**. This button is available when just one surface is selected. (If two or more surfaces are selected, it becomes the **Group** button.)

Group

groups two or more selected surfaces and gives the group the name entered in **Name**. This button replaces the **Rename** button when two or more surfaces are selected.

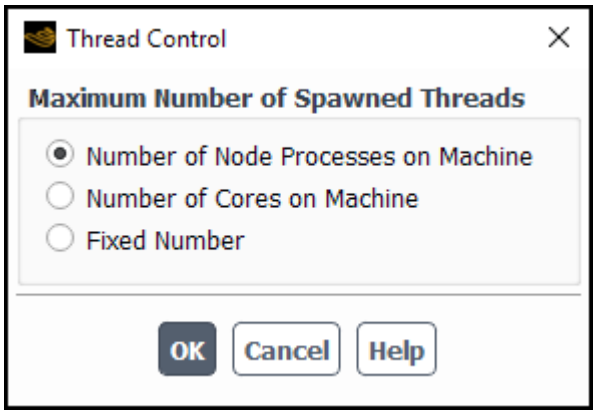
Delete

deletes the selected surface(s).

51.2.116. Thread Control Dialog Box

The **Thread Control** dialog box allows you to control the maximum number of threads on each machine, as described in Controlling the Threads (p. 4311).

Parallel → General → Thread Control...



Controls

Maximum Number of Spawned Threads

contains a list of options for defining the maximum number of threads on each machine.

Number of Node Processes on Machine

specifies that the maximum number of threads on each machine is equal to the number of Ansys Fluent node processes on each machine.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Cores on Machine

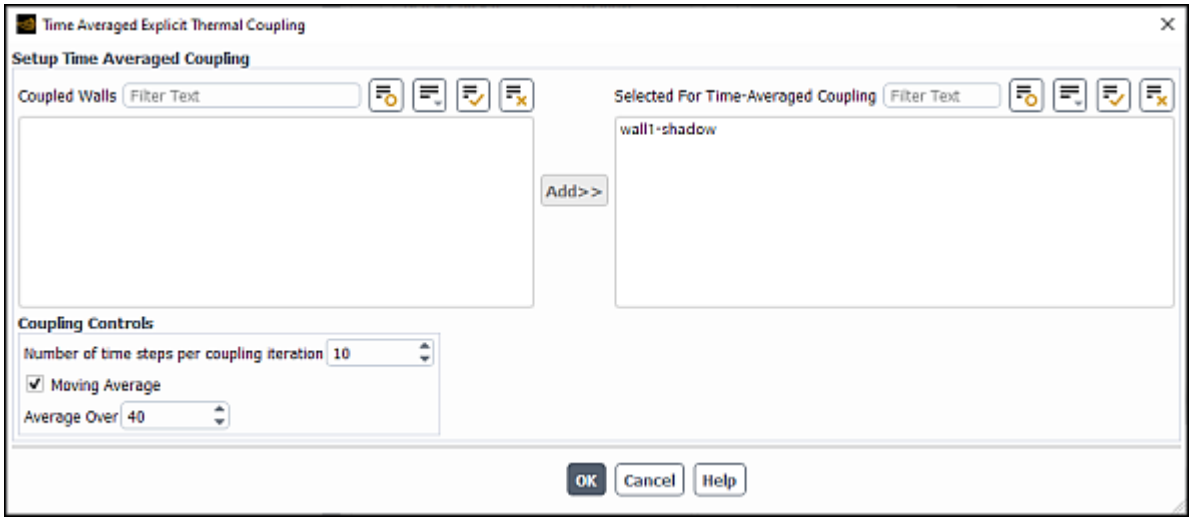
specifies that the maximum number of threads on each machine is equal to the number of cores on the machine. Ansys Fluent obtains the number of cores from the OS.

Fixed Number

specifies that the maximum number of threads that can be spawned on each machine is equal to the number you provide in the number-entry box below **Fixed Number**.

51.2.117. Time Averaged Explicit Thermal Coupling Dialog Box

The **Time Averaged Explicit Thermal Coupling** dialog box specifies transient conjugate heat transfer. Each coupling cycle is specified for a number of time steps at which the exchange of thermal boundary condition quantities occurs. See Time Averaged Explicit Thermal Coupling (p. 2141) for details about the items below.



Controls

Coupled Walls

list of coupled walls available for CHT.

Selected for Time-Averaged Coupling

list of walls selected for CHT.

Coupling Controls

contains options for the thermal coupling.

Number of time steps per coupling iteration

specifies the number of time steps between coupling iterations.

Moving Average

enables a moving average for the explicit coupling.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

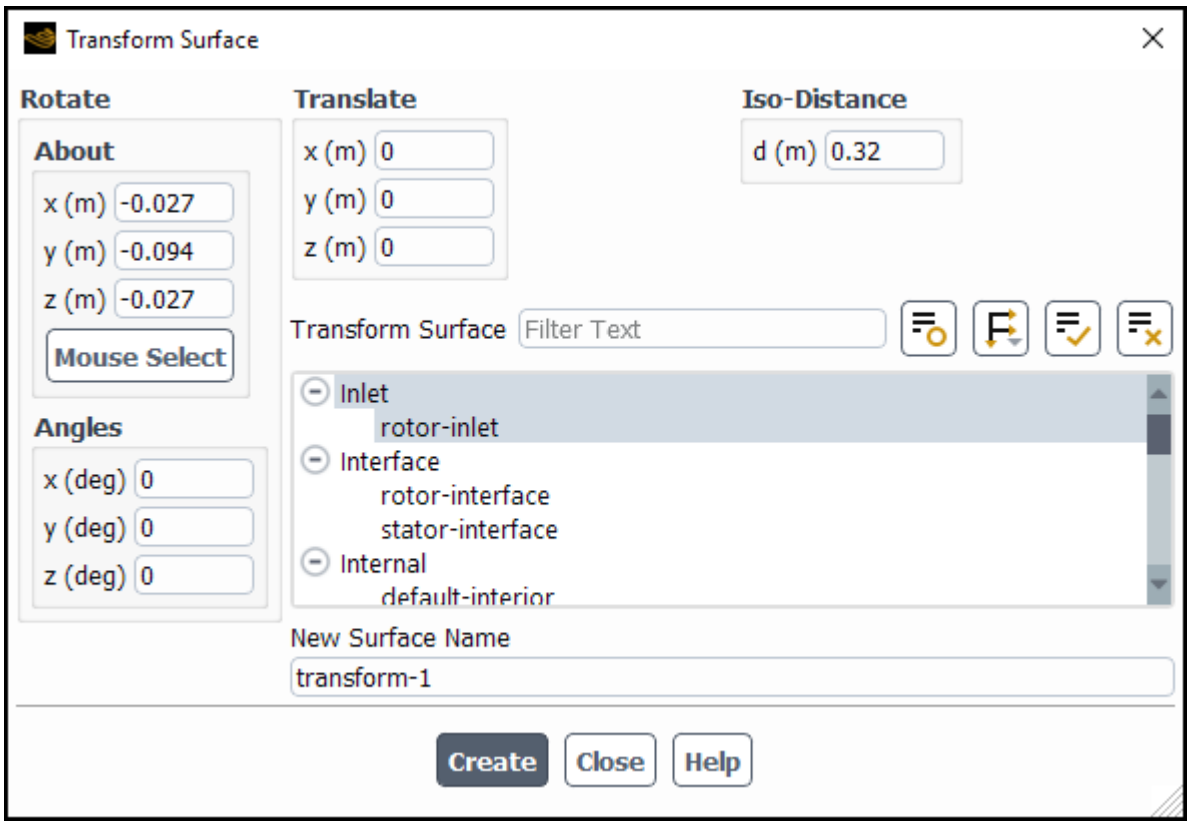
Average Over

specifies the number of times steps over which the data is averaged for explicit coupling.

51.2.118. Transform Surface Dialog Box

The **Transform Surface** dialog box allows you to create a new data surface by rotating and/or translating an existing surface, and/or by specifying a constant normal distance from it. See Transforming Surfaces (p. 3823) for details about the items below.

Domain → Surface → Create → Transform...



Controls

Rotate

contains the transformation parameters for rotation.

About

defines the origin about which the surface is rotated. You will specify a point, and the origin of the coordinate system for the rotation will be set to the specified point. For example, if you specified the point (1,0) in 2D, rotation would be about the z axis anchored at (1,0). You can either enter the point's coordinates in the **x,y,z** fields or click the **Mouse Select** button and select a point in the graphics window using the mouse.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Angles

define the angles about the **x**, **y**, and **z** axes (that is, the axes of the coordinate system with the origin defined under **About**) by which the surface is rotated. For 2D problems, you can specify rotation about the **z** axis only.

Translate

contains the transformation parameters for translation.

x,y,z

define the distance by which the surface is translated in each direction.

Iso-Distance

contains the transformation parameters for "isodistancing."

d

sets the normal distance between the original surface and the transformed surface.

Transform Surface

contains a list of existing surfaces from which you can select the surface to be transformed. The selected surface will remain unchanged; the transformation will create a new surface.

New Surface Name

designates the name of the new surface. The default is the concatenation of the transformation type (that is, iso-distance, rotate, or translate) and an integer which is the new surface ID.

Create

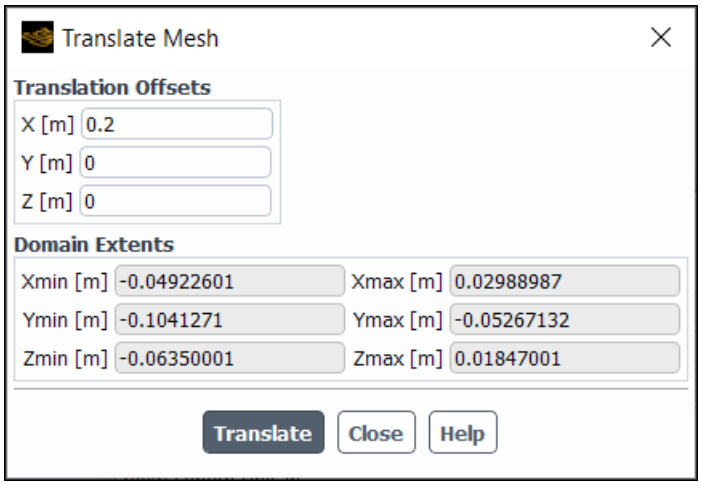
creates the surface.

51.2.119. Translate Mesh Dialog Box

The **Translate Mesh** dialog box allows you to change the origin of the mesh. See Translating the Mesh (p. 1265) for details.

Domain → Mesh → Transform → Translate...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Translation Offsets

contains the desired changes in the mesh coordinates (that is, the desired delta in the axes origin). You can enter a positive or negative real number.

X,Y,Z

defines the deltas in the x, y, and z directions, in the current units of length.

Domain Extents

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

Xmin, Ymin, Zmin

shows the minimum values of Cartesian coordinates in the mesh.

Xmax, Ymax, Zmax

shows the maximum values of Cartesian coordinates in the mesh.

Translate

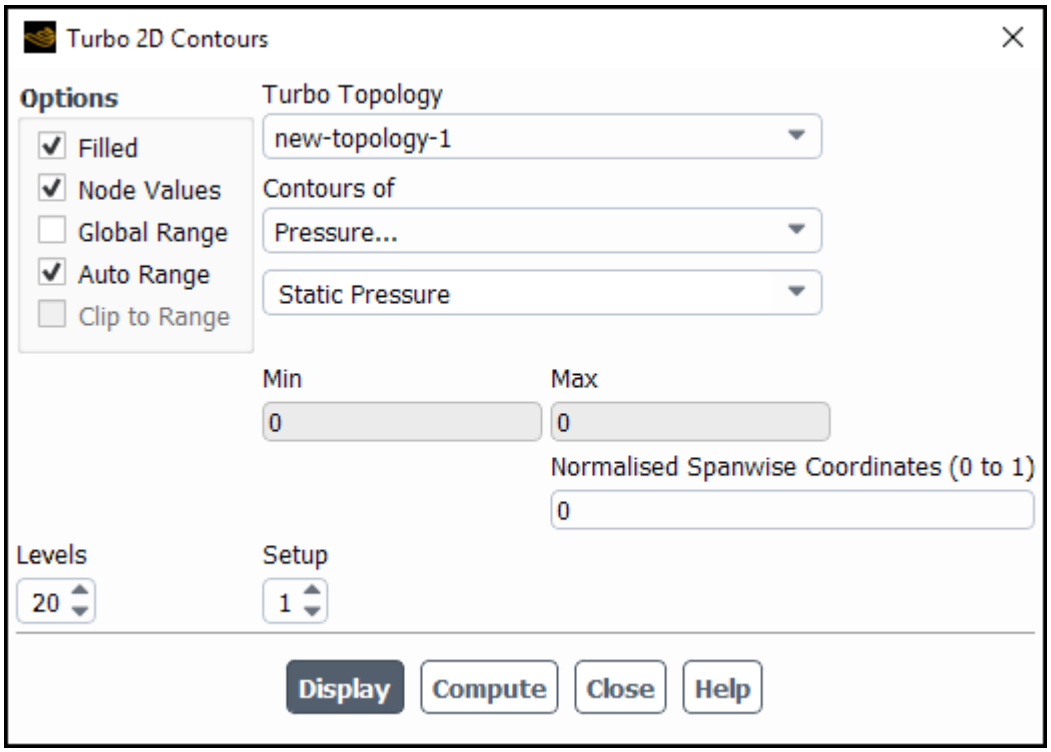
adds the specified translation offsets to the appropriate Cartesian coordinate of every node in the mesh.

51.2.120. Turbo 2D Contours Dialog Box

The **Turbo 2D Contours** dialog box enables you to display turbomachinery-specific contours of variables on surfaces of constant pitchwise, spanwise, or meridional coordinates, projected onto a plane. See Displaying Turbomachinery 2D Contours (p. 2019) for details.

Results → Model Specific → Turbo Topology → 2D Contours...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Turbo Topology

contains a list of defined topologies. Select from the list to display the values for the selected topology.

Options

contains the check buttons that set various contour display options.

Filled

toggles between filled contours and line contours.

Node Values

toggles between using scalar field values at nodes and at cell centers for computing the contours.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Clip to Range

determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See Specifying the Range of Magnitudes Displayed (p. 3880) for details.

Levels

sets the number of contour levels that are displayed.

Setup

indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the dialog box. See Storing Contour Plot Settings (p. 3883) for details.

Contours of

contains a list from which you can select the scalar field to be contoured.

Min

shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max

shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Normalised Spanwise Coordinates (0 to 1)

enables you to specify the coordinate for the spanwise surface you want to create.

Display

displays the contours in the active graphics window.

Compute

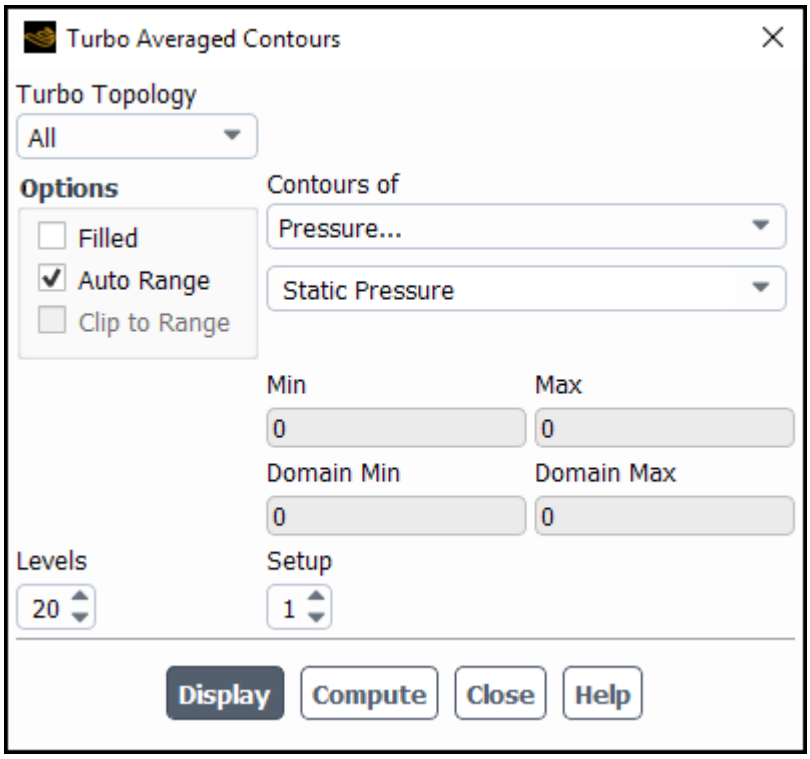
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

51.2.121. Turbo Averaged Contours Dialog Box

The **Turbo Averaged Contours** dialog box enables you to display turbomachinery-specific circumferentially averaged contours of variables projected on an r- z plane. See Displaying Turbomachinery Averaged Contours (p. 2017) for details.

Results → Model Specific → Turbo Topology → Averaged Contours...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Turbo Topology

contains a list of defined topologies. Select from the list to display the values for the selected topology.

Options

contains the check buttons that set various contour display options.

Filled

toggles between filled contours and line contours.

Auto Range

toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Clip to Range

determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See Specifying the Range of Magnitudes Displayed (p. 3880) for details.

Levels

sets the number of contour levels that are displayed.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setup

indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the dialog box. See Storing Contour Plot Settings (p. 3883) for details.

Contours of

contains a list from which you can select the scalar field to be contoured.

Min

shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max

shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Domain Min

shows the global minimum value of the scalar field for the entire domain.

Domain Max

shows the global maximum value of the scalar field for the entire domain.

Display

displays the contours in the active graphics window.

Compute

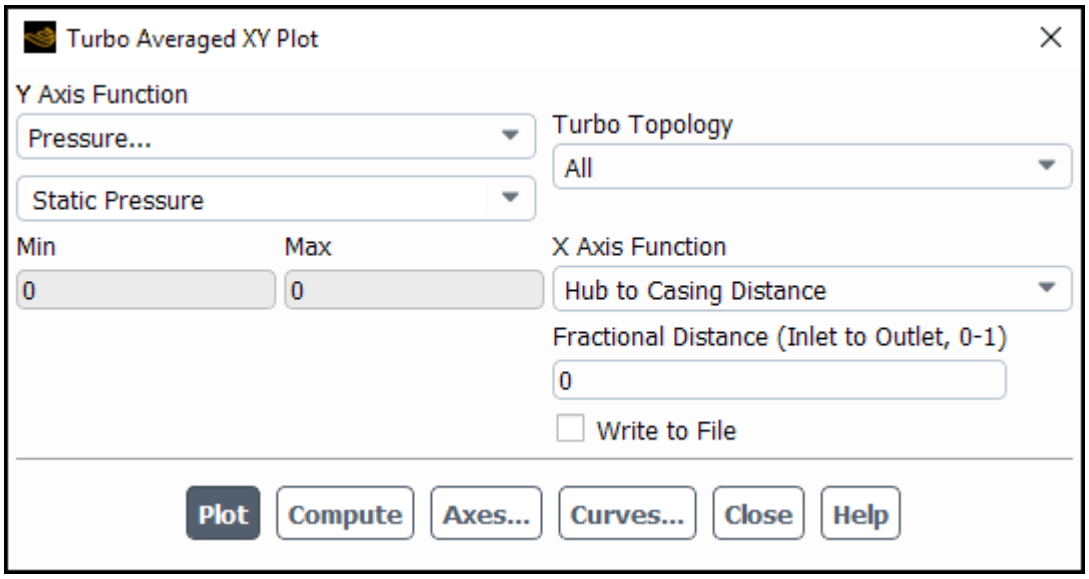
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

51.2.122. Turbo Averaged XY Plot Dialog Box

The **Turbo Averaged XY Plot** dialog box enables you to display data in an XY plot format as a function of either the meridional or the spanwise coordinate. See Generating Averaged XY Plots of Turbomachinery Solution Data (p. 2021) for details.

Results → Model Specific → Turbo Topology → Averaged XY Plot...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Y Axis Function

contains a list of solution variables that can be used for the y axis of the plot.

Min

shows the minimum value of the scalar field.

Max

shows the maximum value of the scalar field.

Turbo Topology

contains a list of defined topologies. Select from the list to display the values for the selected topology.

X Axis Function

enables you to select the coordinate to be used for the x axis of the plot. The choices are **Hub to Casing Distance** (spanwise coordinate), and **Meridional Distance** (meridional coordinate).

Fractional Distance

sets a fractional value (0 to 1) for either the spanwise **Hub to Casing** distance or the meridional **Inlet to Outlet** distance, depending on your selection for **X Axis Function**.

Write to File

enables the file-writing option. When this option is selected, the **Plot** button will change to **Write...**. Clicking on the **Write...** button will open The Select File Dialog Box (p. 907), in which you can specify a name and save a file containing the plot data. The format of this file is described in XY Plot File Format (p. 4038).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot

plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the **Write to File** option is turned on, this button becomes the **Write...** button.

Write...

opens The Select File Dialog Box (p. 907), in which you can save the plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

Compute

calculates the scalar field and updates the **Min** and **Max** values.

Axes...

opens the Axes Dialog Box (p. 5259), which enables you to customize the plot axes.

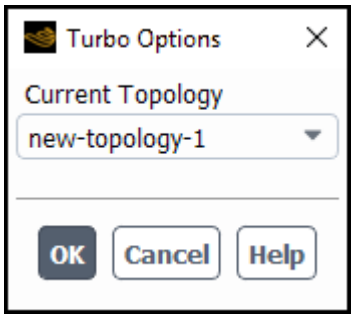
Curves...

opens the Curves Dialog Box (p. 5262), which enables you to customize the curves used in the XY plot.

51.2.123. Turbo Options Dialog Box

The **Turbo Options** dialog box enables you to globally set the turbomachinery topology for your model. See Globally Setting the Turbomachinery Topology (p. 2023) for details.

Results → **Model Specific** → **Turbo Topology** → **Options...**



Controls

Current Topology

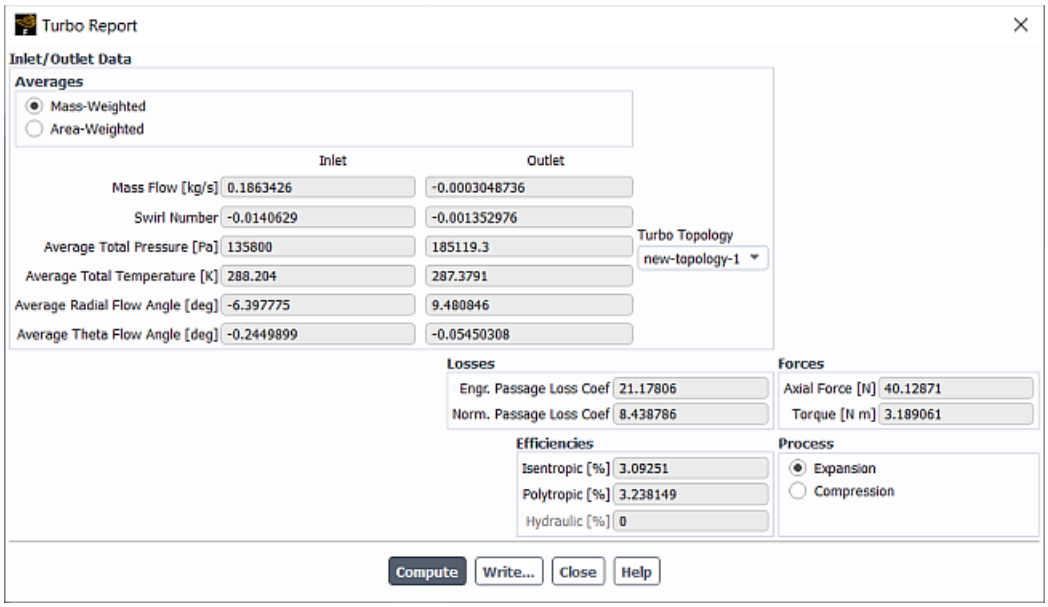
contains a list of predefined turbo topologies.

51.2.124. Turbo Report Dialog Box

The **Turbo Report** dialog box allows you to calculate turbomachinery-specific quantities and integrals. See Generating Reports of Turbomachinery Data (p. 2009) for details.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Results → Model Specific → Turbo Topology → Report...



Controls

Inlet/Outlet Data

contains quantities that can be calculated at inlets and outlets.

Averages

allows you to choose between **Mass-Weighted** and **Area-Weighted** averages for all applicable computed quantities. These quantities are calculated for the **Inlet** and **Outlet** topologies where applicable.

Turbo Topology

contains a list of defined topologies. Select from the list to display the values for the selected topology.

Mass Flow

is the mass flow rate through a surface as defined in Equation 13.19 (p. 2010).

Swirl Number

is the swirl number as defined in Equation 13.20 (p. 2010).

Average Total Pressure

is the area-averaged or mass-averaged total pressure as defined in Equation 13.21 (p. 2011) or Equation 13.22 (p. 2011).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Average Total Temperature

is the area-averaged or mass-averaged total temperature as defined in Equation 13.23 (p. 2011) or Equation 13.24 (p. 2011).

Average Radial Flow Angle

is the area-averaged or mass-averaged radial flow angle as defined in Equation 13.25 (p. 2012) or Equation 13.27 (p. 2012).

Average Theta Flow Angle

is the area-averaged or mass-averaged tangential flow angle as defined in Equation 13.26 (p. 2012) or Equation 13.28 (p. 2012).

Losses

contains the values of loss-related coefficients.

Engr. Passage Loss Coef

is the engineering loss coefficient as defined in Equation 13.29 (p. 2012).

Norm. Passage Loss Coef

is the normalized loss coefficient as defined in Equation 13.30 (p. 2012).

Forces

contains the axial force and the torque on the rotating parts.

Axial Force

is the axial force on the rotating parts as defined in Equation 13.31 (p. 2013).

Torque

is the torque on the rotating parts as defined in Equation 13.32 (p. 2013).

Efficiencies

contains the values of isentropic, polytropic and hydraulic efficiencies.

Isentropic

is the isentropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in Equation 13.37 (p. 2015) or Equation 13.43 (p. 2017).

Polytropic

is the polytropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in Equation 13.38 (p. 2015) or Equation 13.44 (p. 2017).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Hydraulic

is the hydraulic efficiency for a pump or a hydraulic turbine (motor) calculated in the presence of an incompressible working fluid as defined in Equation 13.33 (p. 2014) or Equation 13.39 (p. 2016).

Process

specifies whether to compute the efficiency for the flow **Expansion** (for example, in a turbine) or **Compression** (for example, in a pump or compressor).

Compute

starts the calculation of the quantities in all the fields in the **Turbo Report** dialog box. Note that this process may take some time for a large problem.

Write...

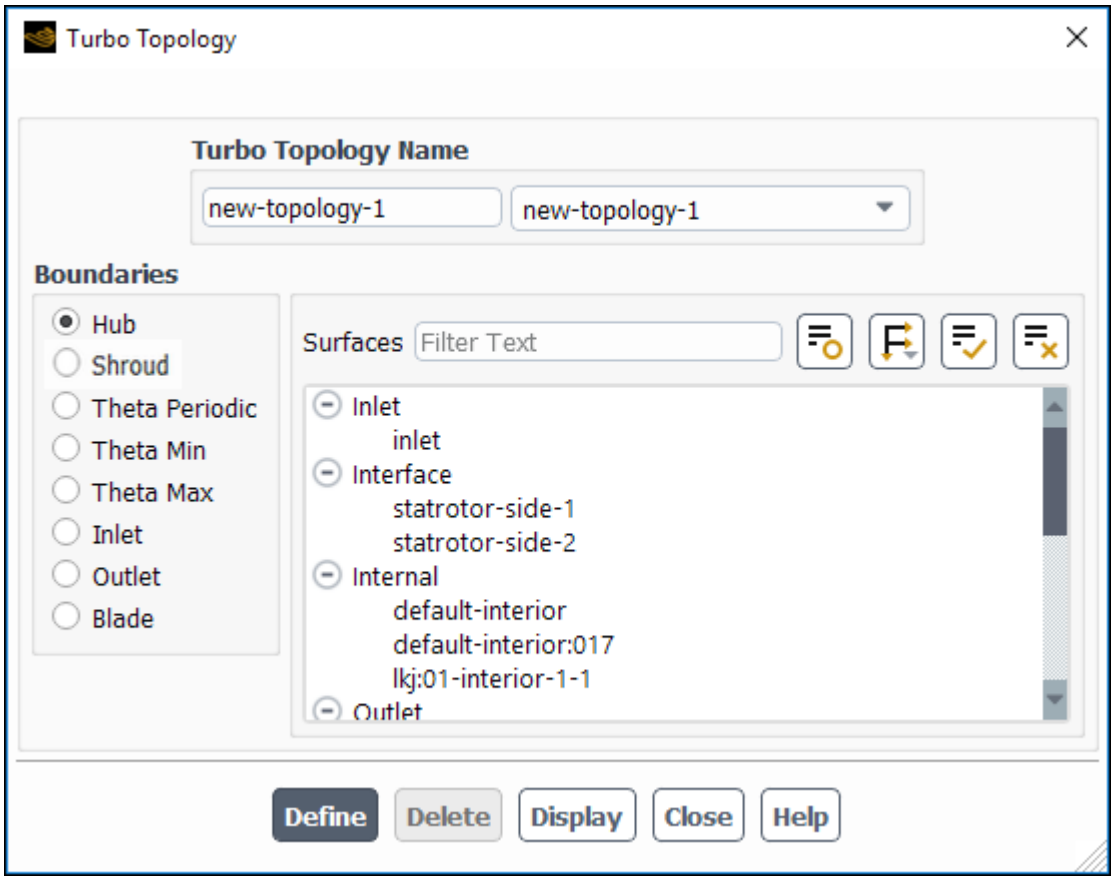
opens the **Select File** dialog box, which you can use to save the reported values to a file.

51.2.125. Turbo Topology Dialog Box

The **Turbo Topology** dialog box allows you to define the topology for a turbomachinery application, so that you can use the turbomachinery-specific postprocessing features described in Turbomachinery Postprocessing (p. 1997). See Defining the Turbomachinery Topology (p. 1997) for details about the items below.

Domain → Mesh Models → Turbo Topology...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Turbo Topology Name

specifies the name of the new topology.

Boundaries

contains radio buttons for the topology boundaries to be defined.

Hub

specifies the definition for the wall zone(s) forming the lower boundary of the flow passage (generally toward the axis of rotation of the machine).

, Shroud

specifies the definition of the wall zone(s) forming the upper boundary of the flow passage (away from the axis of rotation of the machine).

Theta Periodic

specifies the definition of the periodic boundary zone(s) on the circumferential boundaries of the flow passage.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Theta Min, Theta Max

specify the definition of the wall zones at the minimum and maximum angular (θ) positions on a circumferential boundary.

Inlet

specifies the definition of the inlet zone(s) through which the flow enters the passage.

Outlet

specifies the definition of the outlet zone(s) through which the flow exits the passage.

Blade

specifies the definition of the wall zone(s) that defines the blade(s) (if any). Note that these zones cannot be attached to the circumferential boundaries. For this situation, use **Theta Min** and **Theta Max** to define the blade.

Surfaces

contains a selectable list of the available surfaces, from which you can select the surface(s) that represent the boundary selected under **Boundaries**.

Define

defines the new topology. If you have selected an existing topology the **Define** button is replaced by the **Modify** button.

Display

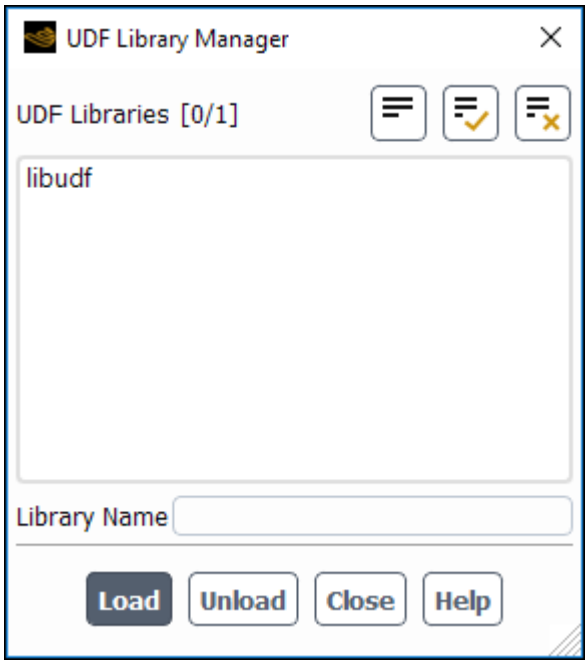
displays the defined topology in the active graphics window.

51.2.126. UDF Library Manager Dialog Box

The **UDF Library Manager** dialog box allows you to load/unload the user-defined function libraries. See the separate Fluent Customization Manual for details.

User Defined → **User Defined** → **Functions** → **Manage...**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

UDF Libraries

lists the user-defined function libraries that are loaded in Ansys Fluent.

Library Name

specifies the name of the library to be loaded/unloaded.

Load

opens the specified library and loads the user-defined function.

Unload

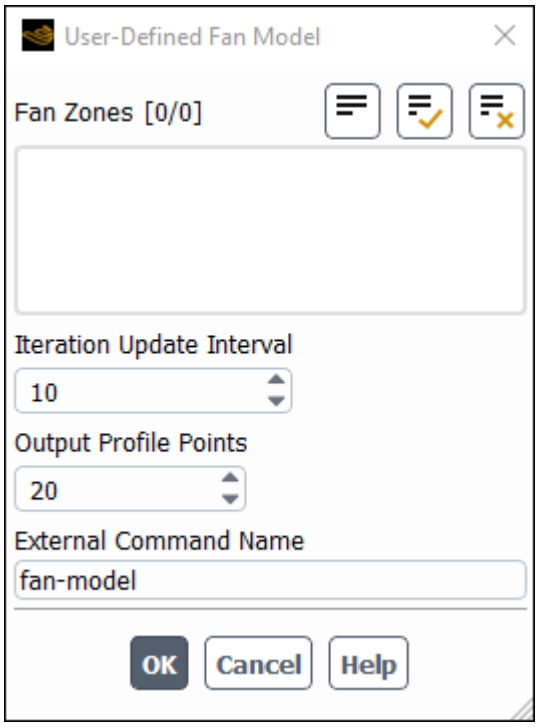
unloads the specified library.

51.2.127. User-Defined Fan Model Dialog Box

The **User-Defined Fan Model** dialog box allows you to periodically regenerate a profile file that can be used to specify the characteristics of a fan, including pressure jump across the fan, and radial and swirling components of velocity generated by the fan. See User-Defined Fan Model (p. 1532) for details about this feature and how to use this dialog box.

User Defined → Model Specific → Fan Model...

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Fan Zones

contains a list from which you can select the fan zone(s) on which your executable will operate.

Iteration Update Interval

specifies how often the executable will be called on to update the fan profile file.

Output Profile Points

specifies the number of points in the profile file to be written by Ansys Fluent.

External Command Name

specifies the name of the executable.

51.2.128. User-Defined Function Hooks Dialog Box

The **User-Defined Function Hooks** dialog box allows you to specify user-defined functions (UDFs) connected to a number of models and procedures in Ansys Fluent. See the separate Fluent Customization Manual for details.

Important:

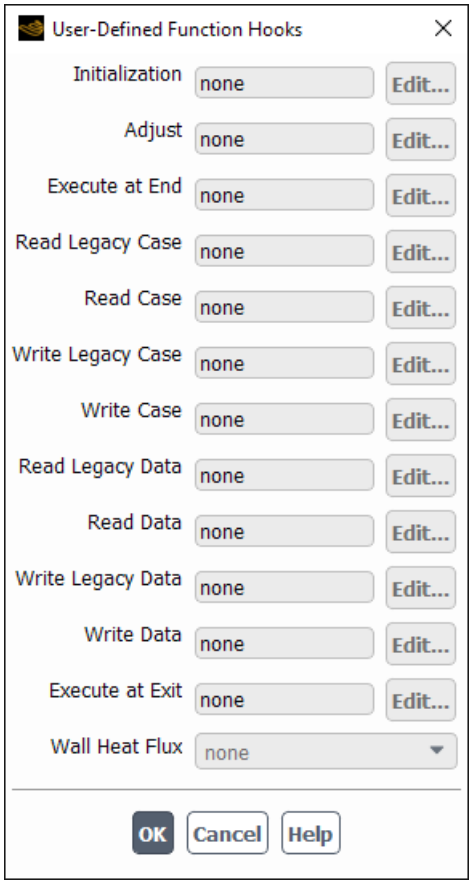
You can hook multiple UDFs to the following functions:

- **Initialization**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Adjust**
- **Execute At End**
- **Read Legacy Case**
- **Read Case**
- **Write Legacy Case**
- **Write Case**
- **Read Legacy Data**
- **Read Data**
- **Write Legacy Data**
- **Write Data**
- **Execute at Exit**

User Defined → User Defined → Function Hooks...



Controls

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Initialization

selects a UDF that is called immediately after you initialize your flow field.

Adjust

selects a UDF that is called at the beginning of an iteration before solution of velocities, pressure, and other quantities begins.

Execute At End

selects a UDF that is called at the end of an iteration or time-step.

Read Legacy Case

selects a UDF that defines a customized section that is to be read from the legacy case file.

Read Case

selects a UDF that defines a customized section that is to be read from the case file.

Write Legacy Case

selects a UDF that defines a customized section that is to be written to the legacy case file.

Write Case

selects a UDF that defines a customized section that is to be written to the case file.

Read Legacy Data

selects a UDF that defines a customized section that is to be read from the legacy data file.

Read Data

selects a UDF that defines a customized section that is to be read from the data file.

Write Legacy Data

selects a UDF that defines a customized section that is to be written to the legacy data file.

Write Data

selects a UDF that defines a customized section that is to be written to the data file.

Execute at Exit

selects a UDF that is called when exiting an Ansys Fluent session.

Wall Heat Flux

selects a UDF that modifies the way that the solver computes the heat flux between a wall and the neighboring fluid cells.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Net Reaction Rate

selects a UDF that defines the net reaction rate.

Volume Reaction Rate

selects a UDF that defines a volumetric reaction rate.

Surface Reaction Rate

selects a UDF that defines a surface reaction rate.

Particle Reaction Rate

selects a UDF that defines a particle reaction rate.

Turbulent Premixed Source

selects a UDF that defines the turbulent flame speed and source term for the premixed or partially premixed combustion model.

Chemistry Step

selects a UDF that defines the chemistry step function.

Spray Collide

selects a UDF that defines the spray collide function.

Cavitation Mass Rate

selects a UDF that defines the cavitation rate.

DO Source

selects a UDF that defines the discrete ordinate source function.

DO Diffuse Reflectivity

selects a UDF that defines the diffuse reflectivity function for the DO radiation model.

DO Specular Reflectivity

selects a UDF that defines the specular reflectivity function for the DO radiation model.

Emissivity Weighting Factor

selects a UDF that defines the emissivity weighting factor for the non-gray DO radiation model or the non-gray P-1 radiation model.

Thickened Flame Model Parameters

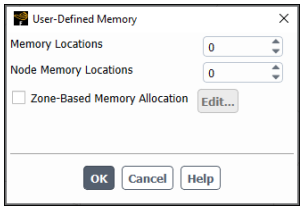
selects a UDF that defines the parameters for the Thickened Flame Model.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

51.2.129. User-Defined Memory Dialog Box

The **User-Defined Memory** dialog box allows you to allocate memory for user-defined storage variables. See the separate Fluent Customization Manual for details.

User-Defined → User Defined → Memory...



Controls

Memory Locations

specifies the number of memory locations to be allocated.

Node Memory Locations

specifies the number of node memory locations to be allocated.

Zone-Based Memory Allocation

specifies that the user-defined memory will only be allocated to the specified zones, rather than the whole domain.

Edit...

opens the Select UDM Zones Dialog Box (p. 5546).

Important:

When writing data files in the legacy format (`.dat` files), you must select the UDM quantities using the **Data File Quantities** dialog box in order to postprocess them in CFD-Post. Alternatively, you have the option of exporting the desired quantities to a `.cdat` file. This will ensure that all the UDM quantities are available for postprocessing in CFD-Post. Refer to the Ansys CFD-Post manual for more information.

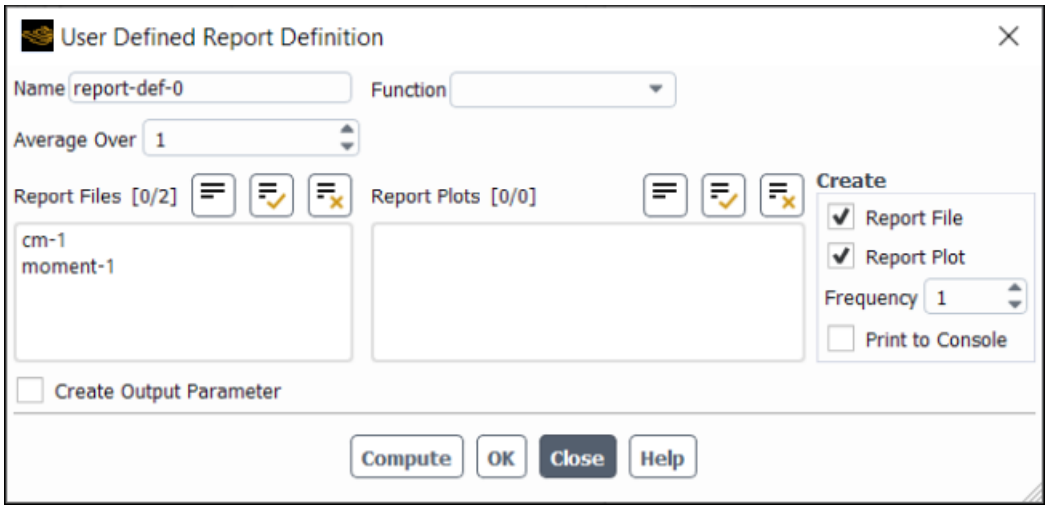
51.2.130. User Defined Report Definition Dialog Box

Solution → Reports → Definitions → New → User Defined...

or

Solution → Report Definitions → New → User Defined

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Function

drop-down list where you can select the function that you loaded for this report definition.

Average Over

(optional) To have Fluent calculate a running average for the **User Defined Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than 1. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

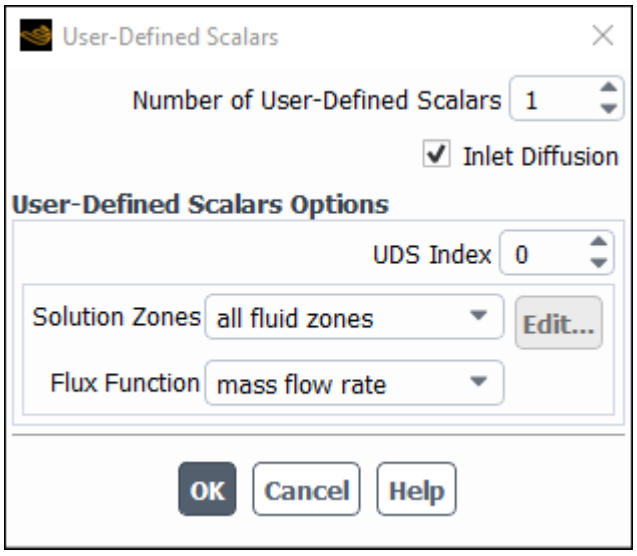
Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

51.2.131. User-Defined Scalars Dialog Box

The **User-Defined Scalars** dialog box allows you to include user-defined scalar transport equations in your calculation. See User-Defined Scalar (UDS) Transport Equations (p. 1709) for details.

User Defined → User Defined → Scalars...



Controls

Number of User-Defined Scalars

specifies how many additional scalar transport equations you would like to include in the calculation.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Inlet Diffusion

when enabled allows you to include the diffusion term in the UDS transport equation for all inflow and outflow boundaries.

User-Defined Scalars Options

contains settings that define the scalar transport equation.

UDS Index

when set to 0 marks the first user-defined scalar equation.

Solution Zones

specifies in which zone the scalar equation will be solved: **all fluid zones**, **all solid zones**, **all zones** (fluid and solid) or **selected zones**.

Flux Function

is a drop-down list containing available functions for the convection term of the user-defined scalar transport equation(s).

none

(the default) indicates that there is no convection term included in the scalar transport equation(s); that is, you want to solve a Poisson equation instead of a convection/diffusion equation.

mass flow rate

indicates that the convection term in the scalar transport equation(s) is equal to the mass flow rate $\rho\vec{v}\cdot\vec{A}$.

Note that the **none** and **mass flow rate** options will apply to all solved user-defined scalars. A user-defined flux function must be supplied if a different convective flux is desired for each user-defined scalar.

Unsteady Function

is a drop-down list containing available functions for the unsteady term of the user-defined scalar transport equation(s).

51.2.132. Vectors Dialog Box

The **Vectors** dialog box controls the display of vector plots. See Displaying Vectors (p. 3886) for details about the items below.

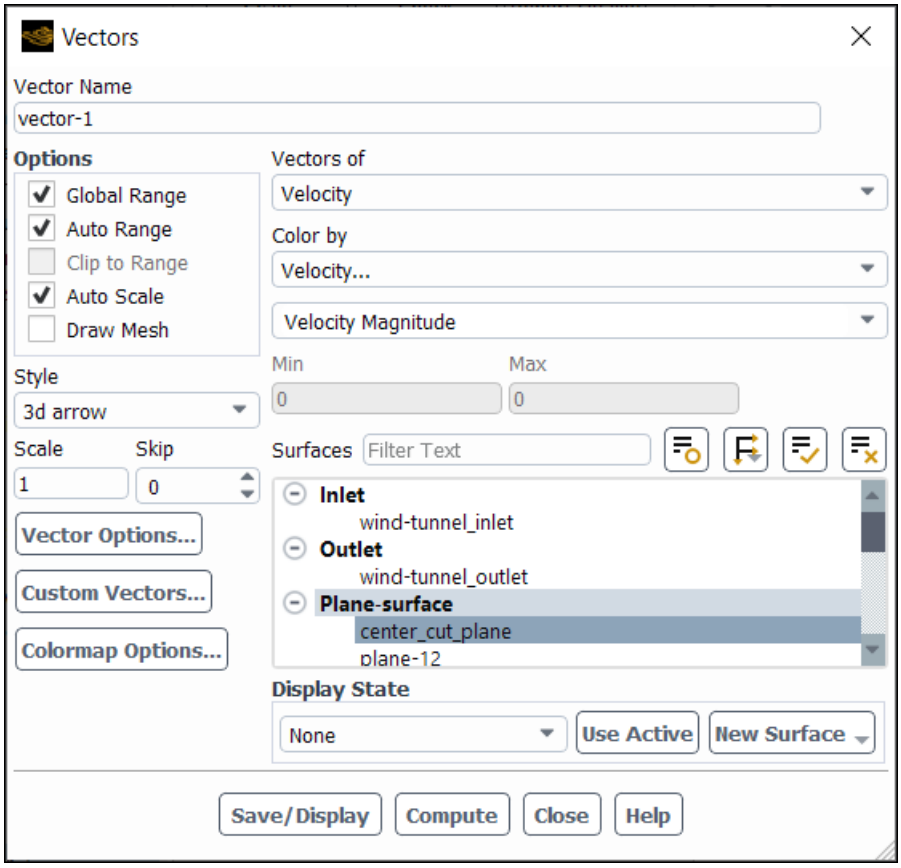
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Results → Graphics → Vectors → New...

Note:

- The "global"/non-persistent form of graphics objects is hidden by default. If this interrupts your workflow, you can make them available by enabling the **Expose legacy non-persistent graphics** option in the **Graphics** branch of **Preferences** (accessed via **File**>**Preferences...**).
- (When you click **Edit...** instead of **New...**, it opens the "global"/non-persistent version of the **Vectors** dialog box. This version of the dialog box does not have a **Name** field and it is not saved with the case file.

  You are encouraged to use the persistent version that is accessed by clicking **New...**.



Controls

Vector Name

is the name for a vector plot definition. You can specify a name or use the default name **`vector-id`**. This control appears only for vector plot definitions.

Options

contains check buttons that set various display options.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the range of scalar field values.

Clip to Range

controls the display of vectors that have a value outside the range specified by **Min** and **Max**. When on, no vectors are displayed outside the range. When off, vectors are displayed outside the range using the colors at the top and bottom of the color scale. This option is applicable only when **Auto Range** is off. See Specifying the Range of Magnitudes Displayed (p. 3891) for details.

Auto Scale

enables the scaling of all vectors in the domain such that when the **Scale** is 1, there will be minimal overlap of vectors.

Draw Mesh

toggles between displaying and not displaying the mesh. The Mesh Display Dialog Box (p. 4636) is opened when **Draw Mesh** is selected.

Style

selects the style in which the vectors are drawn. Available styles are **3d arrow**, **3d arrowhead**, **cone**, **filled-arrow**, **arrow**, **harpoon**, and **headless**.

Scale

sets the factor by which the vectors should be scaled. See Scaling the Vectors (p. 3889) for details.

Skip

allows you to "thin" or "sample" the vectors that are displayed. See Skipping Vectors (p. 3889) for details.

Vector Options...

opens the Vector Options Dialog Box (p. 5185), in which you can set additional options for vector displays. (This button is not available for vector plot definitions.)

Custom Vectors...

opens the Custom Vectors Dialog Box (p. 5186), in which you can define your own vector fields.

Colormap Options...

opens the Colormap Dialog Box (p. 5226), allowing you to customize the colormap for this graphics object.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Vectors of

contains a list from which you can select the vector field to be plotted.

Color by

contains a list from which you can select the scalar field by which the vectors are colored.

Phase

(Multiphase only) specifies the phase where the postprocessing operations are being applied.

Min

shows the value to which the lower end of the color scale is mapped. You can set this value manually if **Auto Range** is off.

Max

shows the value to which the upper end of the color scale is mapped. You can set this value manually if **Auto Range** is off.

Surfaces

contains a list from which you can select the surfaces on which to display vectors. In 2D, vectors are displayed on the entire domain if no surface is selected.

Display State

specifies the display state that is associated with this graphics object.

drop-down list of display states

selectable list of all the existing display states associated with this case.

Use Active

creates a display state that matches the settings of the active graphics window and assigns it to this graphics object (this association is only saved after you click **Save/Display**).

New Surface

is a drop-down list button that contains a list of surface options:

Point

opens the Point Surface Dialog Box (p. 5525).

Line/Rake

opens the Line/Rake Surface Dialog Box (p. 5458).

Plane

opens the Plane Surface Dialog Box (p. 5523).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Quadric

opens the Quadric Surface Dialog Box (p. 5527).

Iso-Surface

opens the Iso-Surface Dialog Box (p. 5445).

Iso-Clip

opens the Iso-Clip Dialog Box (p. 5444).

Structural Point

opens the Structural Point Surface Dialog Box (p. 5565).

Display

displays the vectors in the active graphics window.

Compute

calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

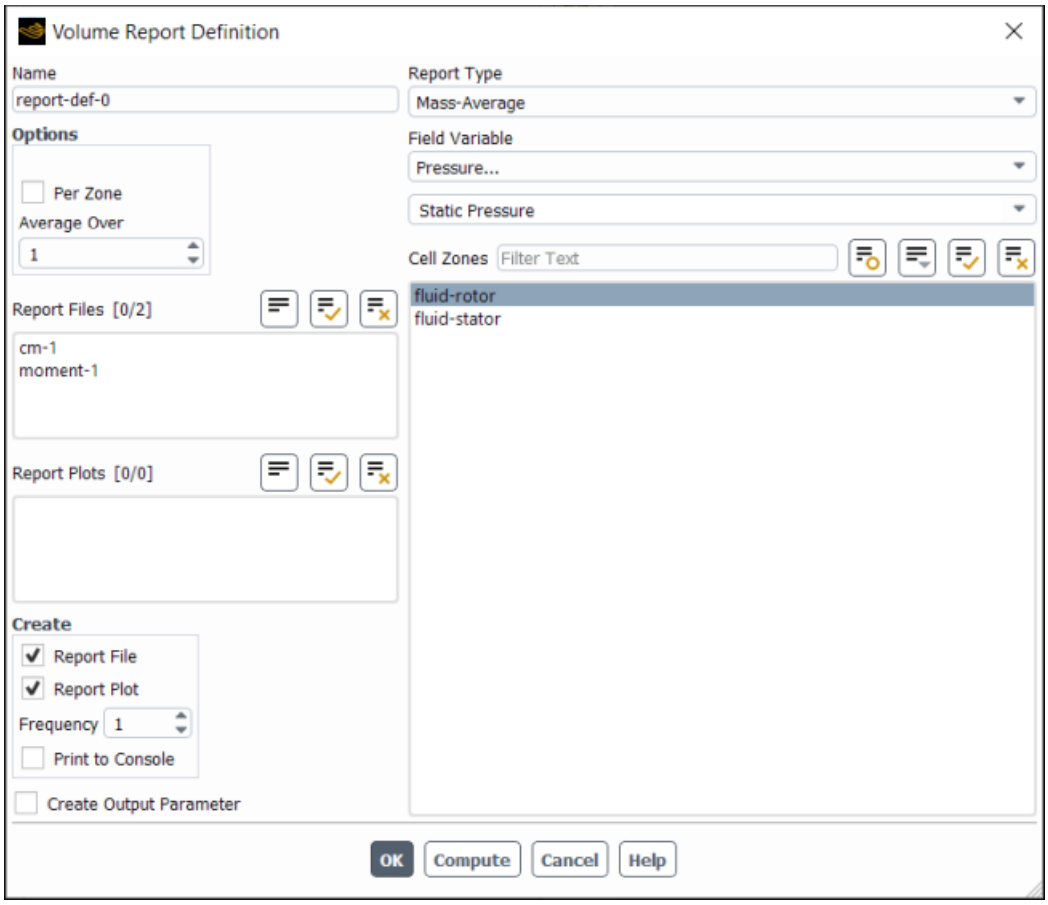
Save/Display

plots the vectors in the active graphics window and saves the vector plot definition. This button appears only for vector plot definitions and replaces the **Display** button.

51.2.133. Volume Report Definition Dialog Box

Solution → **Reports** → **Definitions** → **New** → **Volume Report**

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the report definition.

Options

Per Zone

specifies whether or not the chosen field variable is calculated from all of the selected cell zones combined (default) or individually on each of the selected cell zones.

Average Over

(optional) To have Fluent calculate a running average for the **Volume Report Definition** you can enter a positive integer greater than 1 (the default) for **Average Over**.

Specifying a number greater than 1 means that Fluent will print, plot, and write the running average value of the selected variable instead of the current value of the same variable.

The value reported is averaged over the last N *iterations/time steps, where* N *is your specified* ***Average Over*** *value. When the iteration/time step number is lower than* N*, Fluent calculates the average of the available variable values.*

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Retain Instantaneous Values

appears when **Average Over** is set to a value greater than `1`. If enabled when you are creating a new report definition, it ensures that all instantaneous values are saved in the new report file that is being created for this report definition. It also results in the **Plot Instantaneous Values** option being enabled in the newly created report plot.

Report Files

lists all of the report files where you can write the report definition data.

Report Plots

lists all of the report plots where you can plot the report definition data (assuming this report has the same units as the other report definitions included in the selected report plot).

Create

Report File

creates a new report file that includes this report definition.

Report Plot

creates a new report plot that includes this report definition.

Frequency

specifies how frequently the report definition is written, plotted, or printed to the console.

Print to Console

prints the value of the report definition to the console.

Create Output Parameter

creates an output parameter for this report definition with the name `<report definition name>-op`.

Report Type

selects the integration method used on the selected cell zones. The available report types are the same as those in the Volume Integrals Dialog Box (p. 5275). See Volume Integration (p. 4119) for details.

Field Variable

contains a list of solution variables that can be monitored on the selected cell zones. This list will not be available if you select **Volume** as the **Report Type**.

Phase

contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cell Zones

contains a selectable list of the current cell zones.

OK

creates the report definition.

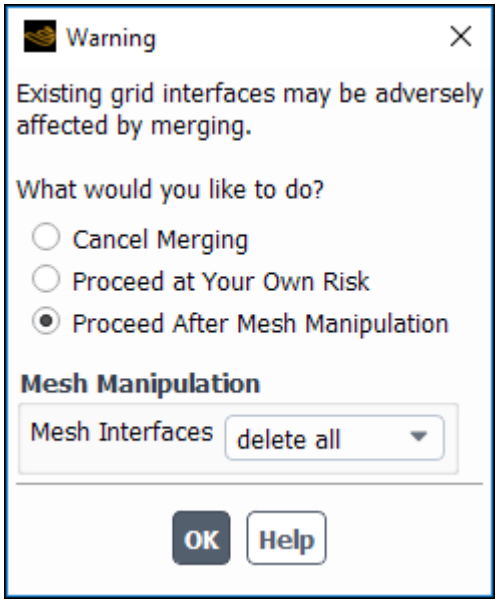
Compute

computes the value of the report definition at the selected zone(s) and prints to the console.

51.2.134. Warning Dialog Box

The **Warning** dialog box allows you to specify whether existing dynamic zones and/or mesh interfaces are deleted when you are using the **Merge Zones** dialog box to merge multiple zones of the same type into a single zone (see Merge Zones Dialog Box (p. 5467) for details). Note that dynamic zones and mesh interfaces that exist at the time of the merge may be adversely affected by the merge.

The **Warning** dialog box opens automatically when you click **Merge** in the Merge Zones Dialog Box (p. 5467) if your case has dynamic zones or mesh interfaces.



Controls

Cancel Merging

returns you to the **Mesh Zones** dialog box when you click **OK**, without initiating the merge.

Proceed at Your Own Risk

allows the merge to proceed when you click **OK**, without deleting the existing dynamic zones and mesh interfaces beforehand.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Proceed After Mesh Manipulation

deletes the existing dynamic zones and/or mesh interfaces (based on the settings in the **Mesh Manipulation** group box) and then merges the zones when you click **OK**.

Mesh Manipulation

allows you to specify whether the existing dynamic zones and/or mesh interfaces are deleted prior to the initiation of the merge. This group box is only available when **Proceed After Mesh Manipulation** is selected.

Dynamic Zones

specifies whether all existing dynamic zones are deleted prior to the merge.

Mesh Interfaces

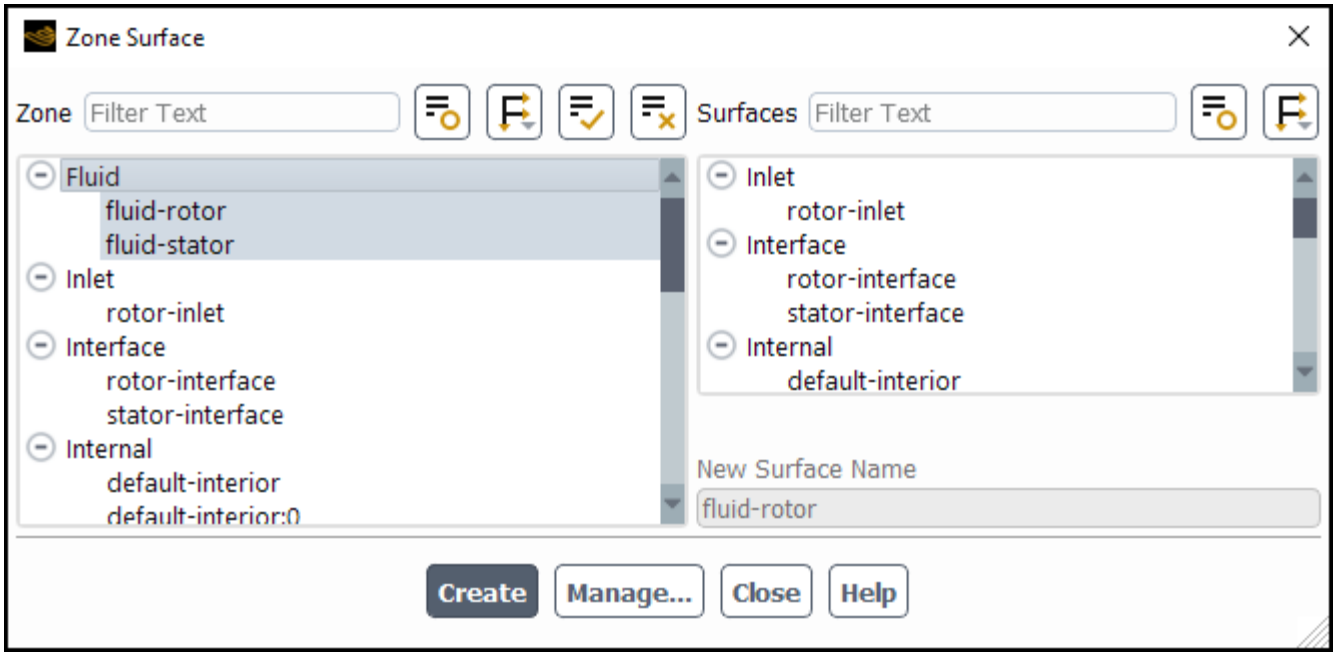
specifies whether all existing mesh interfaces are deleted prior to the merge.

Note that selecting **keep all** from both drop-down lists in the **Mesh Manipulation** group box is the equivalent of selecting **Proceed at Your Own Risk**.

51.2.135. Zone Surface Dialog Box

The **Zone Surface** dialog box allows you to interactively create surfaces from face and cell zones in the domain. See Zone Surfaces (p. 3795) for details about the items below.

Domain → Surface → Create → Zone...



Controls

Zone

lists zones that you can select for creating zone surfaces.

Surfaces

displays an informational list of existing surfaces.

New Surface Name

designates the name of the surface to be created. The default is the zone name.

Create

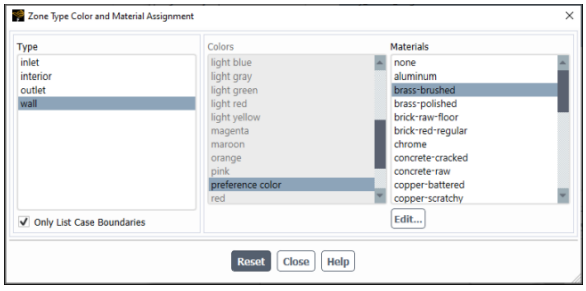
creates the surface.

Manage...

opens the Surfaces Dialog Box (p. 5571) in which you can rename and delete surfaces and determine their sizes.

51.2.136. Zone Type Color and Material Assignment Dialog Box

The **Zone Type Color and Material Assignment** dialog box allows you to control the mesh coloring for meshes displayed using the Displaying the Mesh (p. 3850) with **By Type** selected for **Coloring**. It is opened by clicking **Edit...** next to **By Type** in the Mesh Display Dialog Box (p. 4636) See Zone Surfaces (p. 3795) for details about the items below.



Controls

Type

contains a selectable list of zone types. Select a **Type** to set its color and/or material.

Only List Case Boundaries

limits the **Type** list to only include zone types that are included in the current case file.

Colors

lists the available colors that may be used to color the selected zone type.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Materials

lists the available materials that may be used to color the selected zone type. Click **Edit** if you want to modify a material's color. *See Creating Custom Realistic Materials (p. 3867) for additional information.*

Edit

opens the Material Editor Dialog Box (p. 5465).

Reset

resets the mesh colors and material assignments to the default selections for all zone types.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

Appendix A. Ansys Fluent Model Compatibility

The following tables summarize the compatibility of several Ansys Fluent model categories:

- Multiphase Models (see Modeling Multiphase Flows (p. 2911))
- Moving Domain Models (See Modeling Flows with Moving Reference Frames (p. 1741))
- Turbulence Models (See Modeling Turbulence (p. 2025))
- Combustion Models (See Chapters Modeling Species Transport and Finite-Rate Chemistry (p. 2353) – Modeling Engine Ignition (p. 2569))

Note that a ✓ indicates that two models are compatible with each other, while the absence of a ✓ indicates that two models are not compatible with each other.

Table 1: Moving Domain Models vs. Multiphase Models

Appendix B. Ansys Fluent File Formats

This appendix provides information about the following:

B.1. CFF File Format
B.2. Legacy Case and Data File Formats
B.3. Mesh Morpher/Optimizer File Formats
B.4. Conduction Settings File Format
B.5. 3D Fan Curve File Format

B.1. CFF File Format

By default, Ansys Fluent writes case and data files in the Common Fluids Format (CFF). CFF files offer greatly improved read and write performance compared to legacy files and can be postprocessed in CFD-Post and EnSight, as well as in third-party products. A case file contains a mesh and settings for your specific problem. Solution data are typically saved in a separate data file related to the case file where the mesh and settings are stored.

The CFF format is based on the HDF5 format, which is an open-source hierarchical data format and a library of APIs that provides a near-random access to any dataset in both serial and parallel processing environments. All settings are saved as formatted strings in multiple groups of CFF files. Heavy-weight data are stored as a 1D or 2D array in the HDF5 dataset. Additional light-weight data (such as minimum and maximum IDs, total number of elements/subgroups, and so on) are added to the groups and dataset as attributes.

Information is presented in the following sections:

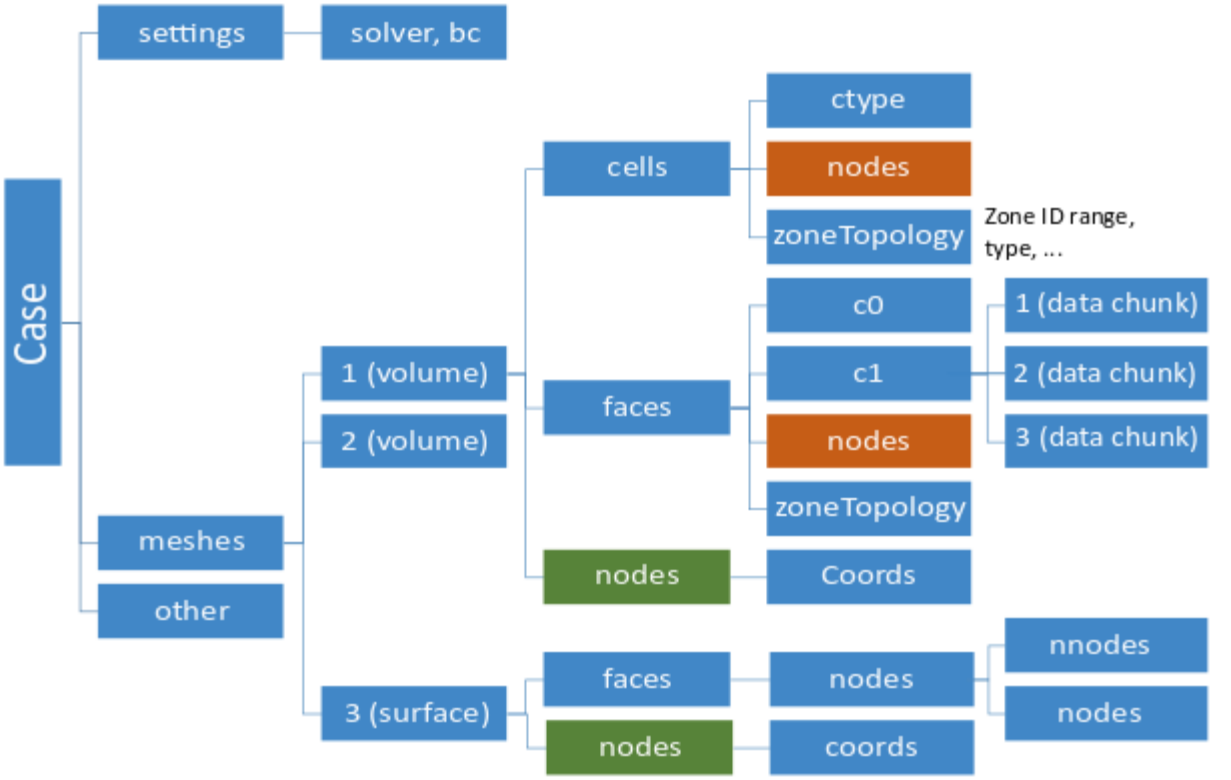
B.1.1. CFF Case File Layout
B.1.2. CFF Solution Data File Layout
B.1.3. Variable Sized Data on Collected Element / Node Sets

B.1.1. CFF Case File Layout

Figure 1: The CFF Case File Layout (p. 5614) schematically shows a structure of a CFF case file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 1: The CFF Case File Layout



A case file contains the following groups:

- `meshes`

  The `meshes` group stores mesh data and can host multiple meshes. Each mesh is stored in a separate subgroup with an integer ID as the section name. The ID is currently not used, and only one section is expected (ID = 1). The connectivities of faces, cells and nodes are each stored in separate sections called `faces`, `cells`, and `nodes`, respectively. The connectivity is local to each mesh. All these settings are saved as formatted strings in multiple file sections. Any lightweight settings are stored within a specific section.

- `settings`

  The `settings` group stores information about case settings, which include:

  – Physical models

  – Solver settings

  – Boundary conditions

  – Materials

  Each solver can write its settings in its native format as strings that can be read back natively.

- `other` (optional)

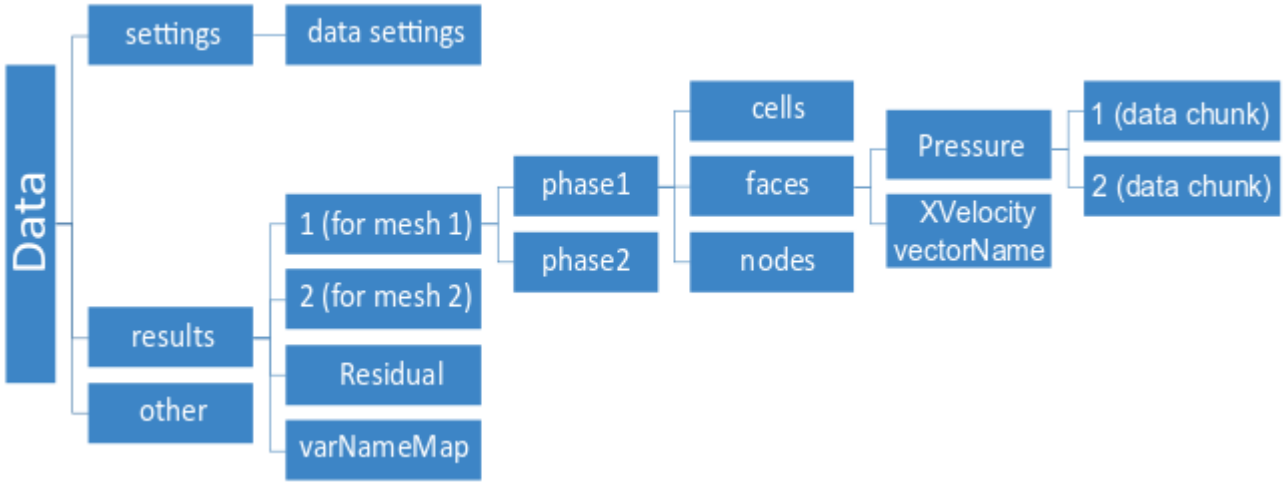
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The `other` group is used by specific solvers to save any mesh-related data other than those stored in the `meshes` group. These data will normally be consumed by the original solver that wrote it. If it is consumed by other parties, a certain agreement will be used between the parties involved.

B.1.2. CFF Solution Data File Layout

Figure 2: The CFF Data File Layout (p. 5615) schematically shows a structure of a CFF data file.

Figure 2: The CFF Data File Layout



A CFF data file contains the following groups:

- `results`

  The `results` group stores solution data. This group hosts results for multiple meshes, each related to the same mesh ID used in the `meshes` group in the case file. For a multiphase problem, each `results` group has a `phase` subgroup under each mesh (for example `results/1/phases-1/`) that stores the results for this specific phase. The name of the node (for example `phase-1`, `phase-2`, and so on) is synchronized with the phase ID attribute. Under each `phase` subgroup, one or more zone type sections are defined; each zone type contains a list of relevant variables. Lists of variables for different zone types can be different. A data section `fields` lists all available variables as a string for each zone type.

- `settings`

  The `settings` group stores solution-specific settings (such as time step, solver time, and so on). The group contains lightweight data. Each solver writes its settings in its native format as strings that can be read back natively.

- `other` (optional)

  The `other` group stores any solution data associated with meshes in the corresponding case file. These data will normally be consumed by the original solver (usually by Ansys Fluent).

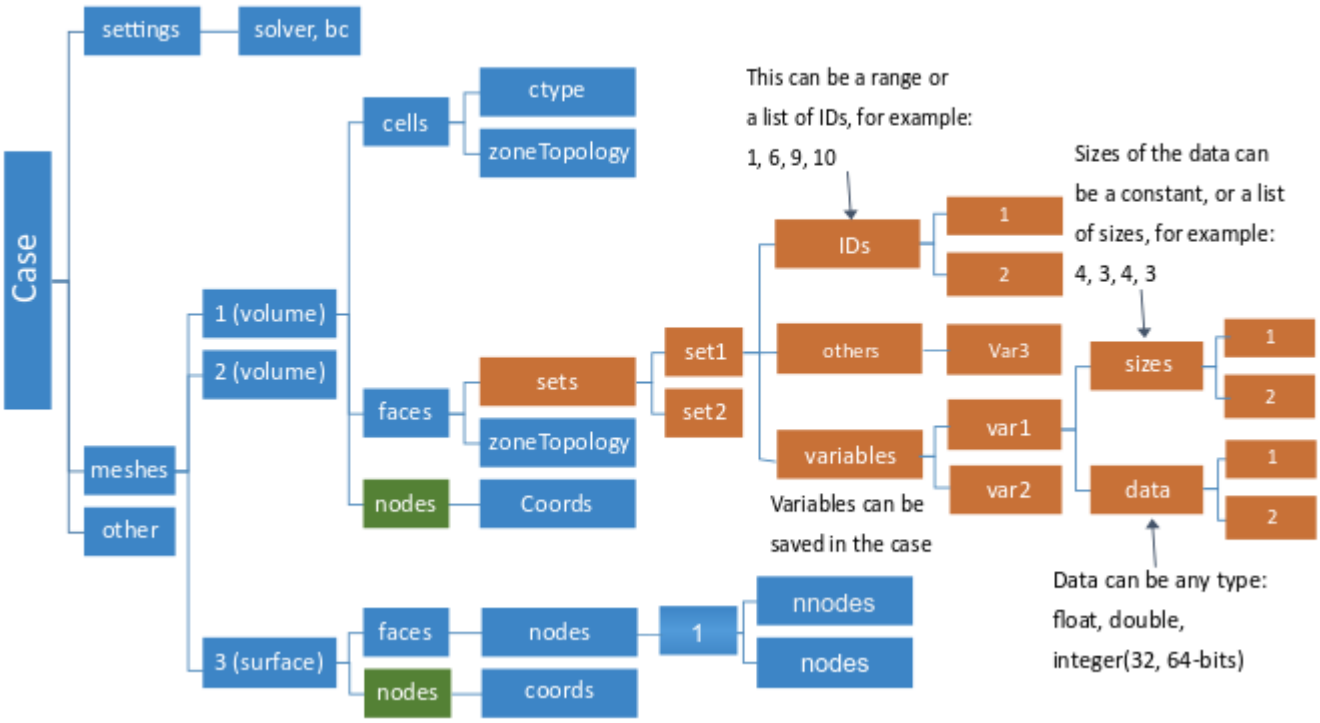
Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B.1.3. Variable Sized Data on Collected Element / Node Sets

Other special data only store information related to specific models (such as the radiation model). They are organized in sets that hold data on a collection of cells/faces/nodes, where their IDs may not be contiguous. With these sets, any data can be saved as needed. The set data will be appended to the case or data files under corresponding zone group.

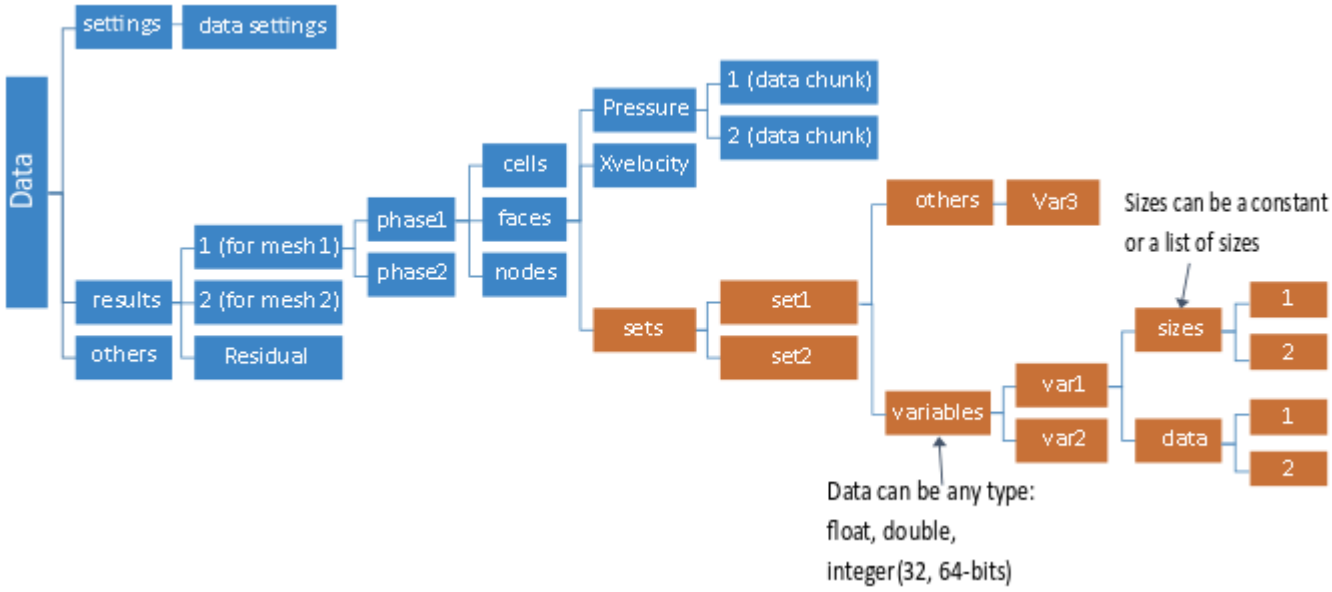
The data associated with elements can be of either a constant or variable length. For the variable length data, the sizes and data are saved in two separate 1D arrays (see Figure 3: Variable Sized Data Appended to the Case File (p. 5616) and Figure 4: Variable Sized Data Appended to the Data File (p. 5617)).

Figure 3: Variable Sized Data Appended to the Case File



Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Figure 4: Variable Sized Data Appended to the Data File



B.2. Legacy Case and Data File Formats

This section describes the contents and formats of Ansys Fluent legacy case and data files. After discussing the Guidelines (p. 5617) and Formatting Conventions in Binary and Formatted Files (p. 5618), the section descriptions are grouped according to function:

- Grid Sections (p. 5618) : Creating grids for Ansys Fluent.
- Other (Non-Grid) Legacy Case Sections (p. 5630)
- Data Sections (p. 5633) : Importing solutions into another postprocessor.

The legacy case and data files may contain other sections that are intended for internal use only.

B.2.1. Guidelines

The Ansys Fluent legacy case and data files are broken into several sections according to the following guidelines:

- Each section is enclosed in parentheses and begins with a decimal integer indicating its type. This integer is different for formatted and binary files (Formatting Conventions in Binary and Formatted Files (p. 5618)).
- All groups of items are enclosed in parentheses. This makes skipping to ends of (sub)sections and parsing them very easy. It also allows for easy and compatible addition of new items in future releases.
- Header information for lists of items is enclosed in separate sets of parentheses preceding the items, and the items are enclosed in their own parentheses.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B.2.2. Formatting Conventions in Binary and Formatted Files

For formatted files, examples of file sections are given in Grid Sections (p. 5618) and Other (Non-Grid) Legacy Case Sections (p. 5630). For binary files, the header indices described in this section (for example, `10` for the node section) are preceded by `20` for single-precision binary data, or by `30` for double-precision binary data (for example, `2010` or `3010` instead of `10`). The end of the binary data is indicated by `End of Binary Section 2010` or `End of Binary Section 3010` before the closing parenthesis of the section.

An example with the binary data represented by periods is as follows:

```
(2010 (2 1 2aad 2 3)(
 .
 .
 .
 )
 End of Binary Section 2010)
```

B.2.3. Grid Sections

Grid sections are stored in the legacy case file. A grid file is a subset of a legacy case file, containing only those sections pertaining to the grid. The currently defined grid sections are:

- Comment (See Comment (p. 5618))
- Header (See Header (p. 5619))
- Dimensions (See Dimensions (p. 5619))
- Nodes (See Nodes (p. 5619))
- Periodic Shadow Faces (See Periodic Shadow Faces (p. 5620))
- Cells (See Cells (p. 5621))
- Faces (See Faces (p. 5623))
- Face Tree (See Face Tree (p. 5625))
- Cell Tree (See Cell Tree (p. 5625))
- Interface Face Parents (See Interface Face Parents (p. 5626))

The section ID numbers are indicated in both symbolic and numeric forms. The symbolic representations are available as symbols in a Scheme source file (`xfile.scm`), which is available from Ansys, Inc., or as macros in a C header file (`xfile.h`), which is located in your installation area.

B.2.3.1. Comment

Index:	0
Scheme symbol:	`xf-comment`
C macro:	`XF_COMMENT`
Status:	optional

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Comment sections can appear anywhere in the file (except within other sections) as:

```
(0 "comment text")
```

You should precede each long section, or group of related sections, by a comment section explaining what is to follow.

Example:

```
(0 "Variables:")
 (37 (
 (relax-mass-flow 1)
 (default-coefficient ())
 (default-method 0)
 ))
```

B.2.3.2. Header

Index:	1
Scheme symbol:	`xf-header`
C macro:	`XF_HEADER`
Status:	optional

Header sections can appear anywhere in the file (except within other sections). The following is an example:

```
(0 "fluent24.1.0 build-id: 0")
```

The purpose of this section is to identify the program that wrote the file. Although it can appear anywhere, it is one of the first sections in the file. Additional header sections indicate other programs that may have been used in generating the file. It provides a history mechanism showing where the file came from and how it was processed.

B.2.3.3. Dimensions

Index:	2
Scheme symbol:	`xf-dimension`
C macro:	`XF_DIMENSION`
Status:	optional

The dimensions of the grid appear as:

```
(2 ND)
```

where ND is 2 or 3. This section is supported as a check that the grid has the appropriate dimension.

B.2.3.4. Nodes

Index:	10
Scheme symbol:	`xf-node`

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C macro:	XF_NODE
Status:	required

Format:

```
(10 (zone-id first-index last-index type ND)(
 x1 y1 z1
 x2 y2 z2
 .
 .
 .
 ))
```

- If zone-id is zero, this provides the total number of nodes in the grid. first-index will then be one, last-index will be the total number of nodes *in hexadecimal*, type is equal to 1, ND is the dimensionality of the grid, and there are no coordinates following (the parentheses for the coordinates are omitted as well).

  For example: (10 (0 1 2d5 1 2))

- If zone-id is greater than zero, it indicates the zone to which the nodes belong. first-index and last-index are the indices of the nodes in the zone, *in hexadecimal*. The values of last-index in each zone must be less than or equal to the value in the declaration section. **Type** is always equal to 1.

  ND is an optional argument that indicates the dimensionality of the node data, where ND is 2 or 3.

  If the number of dimensions in the grid is two, as specified by the node header, then only x and y coordinates are present on each line.

The following is an example of a 2D grid:

```
(10 (1 1 2d5 1 2)(
 1.500000e-01 2.500000e-02
 1.625000e-01 1.250000e-02
   .
   .
   .
 1.750000e-01 0.000000e+00
 2.000000e-01 2.500000e-02
 1.875000e-01 1.250000e-02
 ))
```

Because the grid connectivity is composed of integers representing pointers (see Cells and Faces), using hexadecimal conserves space in the file and provides for faster file input and output. The header indices are in hexadecimal so that they match the indices in the bodies of the grid connectivity sections. The zone-id and type are also in hexadecimal for consistency.

B.2.3.5. Periodic Shadow Faces

Index:	18
Scheme symbol:	xf-periodic-face
C macro:	XF_PERIODIC_FACE
Status:	required only for grids with periodic boundaries

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This section indicates the pairings of periodic faces on periodic boundaries. Grids without periodic boundaries do not have sections of this type. The format of the section is as follows:

```
(18 (first-index last-index periodic-zone shadow-zone)(
 f00 f01
 f10 f11
 f20 f21
 .
 .
 .
 ))
```

where

`first-index` = index of the first periodic face pair in the list

`last-index` = index of the last periodic face pair in the list

`periodic-zone` = zone ID of the periodic face zone

`shadow-zone` = zone ID of the corresponding shadow face zone

These are in hexadecimal format. The indices in the section body (`f*`) refer to the faces on each of the periodic boundaries (in hexadecimal), the indices being offsets into the list of faces for the grid.

Note:

In this case, `first-index` and `last-index` do *not* refer to face indices. They refer to indices in the list of periodic pairs.

Example:

```
(18 (1 2b a c) (
 12 1f
 13 21
 ad 1c2
 .
 .
 .
 ))
```

B.2.3.6. Cells

Index:	12
Scheme symbol:	`xf-cell`
C macro:	`XF_CELL`
Status:	required

The declaration section for cells is similar to that for nodes.

```
(12 (zone-id first-index last-index type element-type))
```

Again, `zone-id` is zero to indicate that it is a declaration of the total number of cells. If `last-index` is zero, then there are no cells in the grid. This is useful when the file contains only a surface

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

mesh to alert Ansys Fluent that it cannot be used. In a declaration section, the `type` has a value of zero and the `element-type` is not present.

For example,

```
(12 (0 1 3e3 0))
```

It states that there are 3e3 (hexadecimal) = 995 cells in the grid. This declaration section is required and must precede the regular cell sections.

The `element-type` in a regular cell section header indicates the type of cells in the section, as follows:

`element-type`	***description***	***nodes/cell***	***faces/cell***
0	mixed		
1	triangular	3	3
2	tetrahedral	4	4
3	quadrilateral	4	4
4	hexahedral	8	6
5	pyramid	5	5
6	wedge	6	5
7	polyhedral	NN	NF

where NN and NF will vary, depending on the specific polyhedral cell.

Regular cell sections have no body, but they have a header of the same format where `first-index` and `last-index` indicate the range for the particular zone, `type` indicates whether the cell zone is an active zone (solid or fluid), or inactive zone (currently only parent cells resulting from hanging node adaption). Active zones are represented with `type`=1, while inactive zones are represented with `type`=32.

In the earlier versions of Ansys Fluent, a distinction was made between solid and fluid zones. This is now determined by properties (that is, material type).

A `type` of zero indicates a dead zone and will be skipped by Ansys Fluent. If a zone is of mixed type (`element-type`=0), it will have a body that lists the `element-type` of each cell.

Example:

```
(12 (9 1 3d 0 0)(
 1 1 1 3 3 1 1 3 1
 .
 .
 .
 ))
```

Here, there are 3D (hexadecimal) = 61 cells in cell zone 9, of which the first 3 are triangles, the next 2 are quadrilaterals, and so on.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B.2.3.7. Faces

Index:	13
Scheme symbol:	`xf-face`
C macro:	XF_FACE
Status:	required

The format for face sections is as follows:

```
(13 (zone-id first-index last-index bc-type face-type))
```

where

`zone-id` = zone ID of the face section
`first-index` = index of the first face in the list
`last-index` = index of the last face in the list
`bc-type` = ID of the boundary condition represented by the face section
`face-type` = ID of the type(s) of face(s) in the section

The current valid boundary condition types are defined in the following table:

`bc-type`	*description*
2	interior
3	wall
4	pressure-inlet, inlet-vent, intake-fan
5	pressure-outlet, exhaust-fan, outlet-vent
7	symmetry
8	periodic-shadow
9	pressure-far-field
10	velocity-inlet
12	periodic
14	fan, porous-jump, radiator
20	mass-flow-inlet, mass-flow-outlet
24	interface
31	parent (hanging node)
36	outflow
37	axis

The faces resulting from the intersection of non-conformal grids are placed in a separate face zone, where a factor of 1000 is added to the `bc-type` (for example, 1003 is a wall zone).

The current valid face types are defined in the following table:

`face-type`	*description*	*nodes/face*

0	mixed	
2	linear	2
3	triangular	3
4	quadrilateral	4
5	polygonal	NN

where NN will vary, depending on the specific polygonal face.

A `zone-id` of zero indicates a declaration section, which provides a count of the total number of faces in the file. Such a section omits the `bc-type` and is not followed by a body with further information.

A nonzero `zone-id` indicates a regular face section, and will be followed by a body that contains information about the grid connectivity. Each line of the body will describe one face and will have the following format:

```
n0 n1 n2 c0 c1
```

where,

`n*` = defining nodes (vertices) of the face

`c*` = adjacent cells

This is the format for a 3D grid with a triangular face format. The actual number of nodes depends on the `face-type`. The order of the cell indices is important, and is determined by the right-hand rule: if you curl the fingers of your right hand in the order of the nodes, your thumb will point toward `c0`.

For 2D grids, `n2` is omitted. `c1` is determined by the cross product of two vectors, $\hat{r}$ and $\hat{k}$. The $\hat{r}$ vector extends from `n0` to `n1`, whereas the $\hat{k}$ vector has its origin at `n0` and points out of the grid plane toward the viewer. If you extend your right hand along $\hat{r}$ and curl your fingers in the direction of the angle between $\hat{r}$ and $\hat{k}$, your thumb will point along $\hat{r}\times\hat{k}$ toward `c1`.

If the face zone is of mixed type (`face-type`= 0) or of polygonal type (`face-type`= 5), each line of the section body will begin with a reference to the number of nodes that make up that particular face, and has the following format:

```
x n0 n1 ... nf c0 c1
```

where,

`x` = the number of nodes (vertices) of the face

`nf` = the final node of the face

All cells, faces, and nodes have positive indices. If a face has a cell only on one side, then either `c0` or `c1` is zero. For files containing only a surface mesh, both these values are zero.

For information on face-node connectivity for various cell types in Ansys Fluent, refer to Face-Node Connectivity in Ansys Fluent (p. 1110).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B.2.3.8. Face Tree

Index:	59
Scheme symbol:	`xf-face-tree`
C macro:	XF_FACE_TREE
Status:	only for grids with hanging node adaption

This section indicates the face hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```
 (59 (face-id0 face-id1 parent-zone-id child-zone-id)
 (
 number-of-kids kid-id-0 kid-id-1 ... kid-id-n
.
.
.
 ))
```

where,

`face-id0` = index of the first parent face in the section

`face-id1` = index of the last parent face in the section

`parent-zone-id` = ID of the zone containing parent faces

`child-zone-id` = ID of the zone containing children faces

`number-of-kids` = the number of children of the parent face

`kid-id-n` = the face IDs of the children

These are in hexadecimal format.

B.2.3.9. Cell Tree

Index:	58
Scheme symbol:	`xf-cell-tree`
C macro:	XF_CELL_TREE
Status:	only for grids with hanging node adaption

This section indicates the cell hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```
 (58 (cell-id0 cell-id1 parent-zone-id child-zone-id)
 (
 number-of-kids kid-id-0 kid-id-1 ... kid-id-n
.
.
.
 ))
```

where,

`cell-id0` = index of the first parent cell in the section

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

`cell-id1` = index of the last parent cell in the section

`parent-zone-id` = ID of the zone containing parent cells

`child-zone-id` = ID of the zone containing children cells

`number-of-kids` = the number of children of the parent cell

`kid-id-n` = the cell IDs of the children

These are in hexadecimal format.

B.2.3.10. Interface Face Parents

Index:	61
Scheme symbol:	`xf-face-parents`
C macro:	`XF_FACE_PARENTS`
Status:	only for grids with non-conformal interfaces

This section indicates the relationship between the intersection faces and original faces. The intersection faces (children) are produced from intersecting two non-conformal surfaces (parents) and are some fraction of the original face. Each child will refer to at least one parent. The format of the section is as follows:

```
(61 (face-id0 face-id1)
(
parent-id-0 parent-id-1
.
.
.
))
```

where,

`face-id0` = index of the first child face in the section

`face-id1` = index of the last child face in the section

`parent-id-*` = index of parent faces

These are in hexadecimal format.

If you set up and save a non-conformal mesh in the solution mode of Fluent and then read it using the meshing mode of Fluent, this section will be skipped; consequently, all the information necessary to preserve the non-conformal interface will not be maintained. When you switch to or read the mesh back into the solution mode, you will need to recreate the interface.

B.2.3.11. Example Files

B.2.3.11.1. Example 1

Figure 5: Quadrilateral Mesh (p. 5627) illustrates a simple quadrilateral mesh with no periodic boundaries or hanging nodes.

```

B.2.4. Other (Non-Grid) Legacy Case Sections

The following sections store boundary conditions, material properties, and solver control settings.

B.2.4.1. Zone

B.2.4.2. Partitions

B.2.4.1. Zone

Index:	39 or 45
Scheme symbol:	`xf-rp-tv`
C macro:	XF_RP_TV
Status:	required

There is typically one zone section for each zone referenced by the grid. Although some grid zones may not have corresponding zone sections, there cannot be more than one zone section for each zone.

A zone section has the following form:

```
(39 (zone-id zone-type zone-name domain-id)(
(condition1 . value1)
(condition2 . value2)
(condition3 . value3)
.
.
.
 ))
```

Grid generators and other preprocessors need only provide the section header and leave the list of conditions empty, as in

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
(39 (zone-id zone-type zone-name domain-id)())
```

The empty parentheses at the end are required. The solver adds conditions as appropriate, depending on the zone type. When only `zone-id`, `zone-type`, `zone-name`, and `domain-id` are specified, the index 45 is preferred for a zone section. However, the index 39 must be used if boundary conditions are present, because any and all remaining information in a section of index 45 after `zone-id`, `zone-type`, `zone-name`, and `domain-id` will be ignored.

Here the `zone-id` is in *decimal* format. This is in contrast to the use of hexadecimal in the grid sections.

The `zone-type` is one of the following:

```
axis
exhaust fan
fan
fluid
inlet vent
intake fan
interface
interior
mass-flow-inlet
mass-flow-outlet
outlet vent
outflow
periodic
porous-jump
pressure-far-field
pressure-inlet
pressure-outlet
radiator
shadow
solid
symmetry
velocity-inlet
wall
```

The `interior`, `fan`, `porous-jump`, and `radiator` types can be assigned only to zones of faces inside the domain. The `interior` type is used for the faces within a cell zone; the others are for interior faces that form infinitely thin surfaces within the domain. Ansys Fluent allows the `wall` type to be assigned to face zones both on the inside and on the boundaries of the domain. Some zone types are valid only for certain types of grid components. For example, cell (element) zones can be assigned only one of the following types:

```
fluid
 solid
```

All of the other types listed above can be used only for boundary (face) zones.

The `zone-name` is a user-specified label for the zone. It must be a valid Scheme symbol [1] and is written without quotes. The rules for a valid `zone-name` (Scheme symbol) are as follows:

- The first character must be a lowercase letter [2] or a special-initial.

[1] See Revised (4) Report on the Algorithmic Language Scheme, William Clinger and Jonathan Rees (Editors), 2 November 1991, Section 7.1.1.

[2] The Standard actually only requires that case be insignificant; the Ansys Fluent implementation accomplishes this by converting all uppercase input to lowercase.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- Each subsequent character must be a lowercase letter, a special-initial, a digit, or a special-subsequent.

where a special-initial character is one of the following:

```
! $ % & * / : < = > ? ~ _ ^
```

and a special-subsequent is one of the following:

```
. + -
```

Examples of valid zone names are `inlet-port/cold!—`, `eggs/easy`, and `e=m*cˆ2`.

Some examples of zone sections produced by grid generators and preprocessors are as follows:

```
(39 (1 fluid fuel 1)())
 (39 (8 pressure-inlet pressure-inlet-8 2)())
 (39 (2 wall wing-skin 3)())
 (39 (3 symmetry mid-plane 1)())
```

The `domain-id` is an integer that appears after the zone name, associating the boundary condition with a particular phase or mixture (sometimes referred to as phase-domains and mixture-domains).

B.2.4.2. Partitions

Index:	40
Scheme symbol:	`xf-partition`
C macro:	XF_PARTITION
Status:	only for partitioned grids

This section indicates each cell's partition. The format of the section is as follows:

```
(40 (zone-id first-index last-index partition-count)(
p1
p2
p3
.
.
.
pn
))
```

where,

`p1` = the partition of the cell whose ID is `first-index`

`p2` = the partition of the cell whose ID is `first-index` +1, and so on

`pn` = the partition of the cell whose ID is `last-index`

`partition-count` = the total number of partitions

Partition IDs must be between 0 and one less than `partition-count`.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

B.2.5. Data Sections

The following sections store iterations, residuals, and data field values.

B.2.5.1. Grid Size
B.2.5.2. Data Field
B.2.5.3. Residuals

B.2.5.1. Grid Size

Index:	33
Scheme symbol:	`xf-grid-size`
C macro:	`XF_GRID_SIZE`
Status:	optional

This section indicates the number of cells, faces, and nodes in the grid that corresponds to the data in the file. This information is used to check that the data and grid match. The format is

```
(33 (n-elements n-faces n-nodes))
```

where the integers are written in decimal.

B.2.5.2. Data Field

Index:	300
Scheme symbol:	`xf-rf-seg-data`
C macro:	`XF_RF_SEG_DATA`
Status:	required

This section lists a flow field solution variable for a cell or face zone. The data are stored in the same order as the cells or faces in the legacy case file. Separate sections are written out for each variable for each face or cell zone on which the variable is stored. The format is

```
(300 (sub-section-id zone-id size n-time-levels
 n-phases first-id last-id)
 ( data for cell or face with id = first-id
 data-for-cell-or-face with id = first-id+1
 ..
 data-for-cell-or-face with id = last-id
 ))
```

where `sub-section-id` is a (decimal) integer that identifies the variable field (for example, 1 for pressure, 2 for velocity). The complete list of these is available in the header file (`xfile.h`), which is located in your installation area.

where,

`zone-id` = the ID number of the cell or face zone

`size` = the length of the variable vector

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

zone-id matches the ID used in legacy case file. size is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species). n-time-levels currently are not used.

A sample legacy data file section for the velocity field in a cell zone for a steady-state, single-phase, 2D problem is shown below:

```
(300 (2 16 2 0 0 17 100)
(8.08462024e-01 8.11823010e-02
 8.78750622e-01 3.15509699e-02
 1.06139672e+00 -3.74040119e-02
...
 1.33301604e+00 -5.04243895e-02
 6.21703446e-01 -2.46118382e-02
 4.41687912e-01 -1.27046436e-01
 1.03528820e-01 -1.01711005e-01
 ))
```

The variables that are listed in the legacy data file depend on the models active at the time the file is written. Variables that are required by the solver based on the current model settings but are missing from the legacy data file are set to their default values when the legacy data file is read. Any extra variables that are present in the legacy data file but are not relevant according to current model settings are ignored.

B.2.5.3. Residuals

Index:	302
Scheme symbol:	xf-rf-scaled-residuals
C macro:	XF_RF_SCALED_RESIDUALS
Status:	optional

This section lists the values of the residuals for a particular data field variable at each iteration:

```
(302 (n residual-section-id size domain-id)
(
iteration_number unscaled_residual scaling_factor
 .
 .
 .
 ))
```

where,

n = the number of residuals

size = the length of the variable vector

residual-section-id = an integer (decimal) indicating the equation

domain-id = domain ID

size is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species. The residual-section-id indicates the equation for which the residual is stored in the section, according to the C constants defined in a header file (xfile.h) available in your installation area, as noted in Grid Sections (p. 5618).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The equations for which residuals are listed in the legacy data file depend on the models active at the time the file is written. If the residual history is missing from the legacy data file for a currently active equation, it is initialized with zeros.

B.3. Mesh Morpher/Optimizer File Formats

This section describes the format of the ASCII text files that can be used as part of the setup for the mesh morpher/optimizer, as described in Using the Mesh Morpher/Optimizer (p. 4568).

The following is an example of a file that can be read or written from the Define Control Points Dialog Box (p. 5376):

```
Control Point Positions
CP No.        X            Y             Z
1             0.73398191   -0.048181638  5.0344162
2             0.51003051   0.52833155    5.100265
3             0.10806149   0.72560567    5.1306067
4             -0.37284759  0.62890923    5.1368165
5             -0.69803506  0.21491928    5.144598
```

The following is an example of a file that can be read or written from the Motion Settings Dialog Box (p. 5486) when **Regular** is selected from the **Control Point Distribution** list in the **Regions** tab of the Mesh Morpher/Optimizer Dialog Box (p. 5471):

```
Reg     CP      Par      X       Y       Z
def-0   2       par1     -1      0       0
def-0   4       par1     2       -1      3
def-0   2       par2     0       1       0
def-1   2       par3     0       0       1
def-1   3       par1     2       0       2
```

The following is an example of a file that can be read or written from the Motion Settings Dialog Box (p. 5486) when **Unstructured** is selected from the **Control Point Distribution** list in the **Regions** tab of the Mesh Morpher/Optimizer Dialog Box (p. 5471):

```
Motion Definition
Name        Type        Par         Dir-x       Dir-y       Dir-z       Orig-x      Orig-y      Orig-z
rad-par1-1  Rad         par-1       0           0           1           0           0           0
tra-par2-1  Trans       par-2       1           1           1
rot-par3-1  Rot         par-3       1           0           0           2           1           1

Assignment to Control Points
Name        Control Points...
rad-par1-1  1           2           3           4           5           6           7
```

When creating or editing a text file used to set up the mesh morpher/optimizer, note the following:

- The file can be created from nothing using a text editor or spreadsheet program, as long as it adheres to the formats described in this section. An easier alternative is to apply some sample definitions using the appropriate dialog box, write a file, and then edit the file using a text editor or spreadsheet program.
- The file must be a tab-delimited ASCII text file.
- The names of the deformation regions (for example, `def-0`), deformation parameters (for example, `par1`), and motions (for example, `tra-par2-1`) must correspond to those that exist in the intended case file.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- When defining control points, the coordinates must lie within a deformation region in the intended case file.
- For the motion settings, the control point numbers must range between 1 and the maximum number of available control points in the intended case file.
- The direction components and coordinates can be any real numbers.

B.4. Conduction Settings File Format

This section describes the format of the `.csv` files that can define conduction settings. The following is an example of such a file:

```
Zone ID,Zone Name,Enable-Shell? (1/0),Layer Number,Material,Layer Thickness (m),Heat Generation Rate (w/m3)
6,wall-1,1,1,aluminum,0.02,0
6,wall-1,1,2,aluminum,0.02,0
7,wall-2,1,1,aluminum,0.05,0
10,wall-6,1,1,aluminum,0.02,0
10,wall-6,1,2,aluminum,0.02,0
8,wall-4,0,1,aluminum,0.02,0
9,wall-5,0,1,aluminum,0,0
```

When creating or editing a file that defines the conduction settings, note the following:

- The file can be created from nothing using a text editor or spreadsheet program, as long as it adheres to the format described in this section. An easier alternative is to apply some sample conduction definitions using the Conduction Manager Dialog Box (p. 5356), generate a file using the **Write...** button, and then edit the file using a text editor or spreadsheet program.
- The file must be a comma-delimited ASCII file.
- The first line contains the column headings shown in the previous example, and then each of the subsequent lines define the settings for a conduction zone/shell layer.
- The zone IDs, zone names, layer numbers, and materials must correspond to those that exist in the intended case file.
- The layer thicknesses must be positive, nonzero values.
- Information will not be written for any wall that defines the heat generation rate using a UDF.
- Fluent always writes conduction files in SI units. If you are using non-SI units, Fluent will do the necessary conversions when the file in re-read.

B.5. 3D Fan Curve File Format

This section describes the format of the ASCII text files that can define the relationship between pressure and flow rate for all of the 3D fan cell zones in a case file, as described in 3D Fan Zones (p. 1350). The following is an example of such a file:

```
cell zone id
17 !CELL_ID
Pressure(Pa) Flowrate(m3/s)
-324.0 1.255
-215.0 1.162
```

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
-109.0 1.032
0.0 0.997
63.0 0.913
105.0 0.862
302.0 0.584
394.0 0.492
406.0 0.432
443.0 0.365
cell zone id
18 !CELL_ID
Pressure(Pa) Flowrate(m3/s)
-333.0 1.130
-215.0 1.122
-165.0 1.064
0.0 0.981
42.0 0.912
90.0 0.855
112.0 0.786
303.0 0.546
344.0 0.492
395.0 0.451
411.0 0.399
442.0 0.324
```

When creating or editing a file that defines the 3D fan zone curve, note the following:

- The file can be created from nothing using a text editor or spreadsheet program, as long as it adheres to the format described in this section.
- The file must be a tab-delimited ASCII file.
- A single file can define multiple cell zones, but it must be read in each of the applicable **Fluid** dialog boxes.
- For each section that defines the curve for a cell zone, the first three lines must follow the convention shown in the previous example, and then each of the subsequent lines must list the experimental results.
- The zone IDs (for example, 12) must correspond to those that exist in the intended case file.
- The units must match those in the case file.

Appendix C. Controlling CHEMKIN-CFD Solver Parameters Using Text Commands

You have access to many parameter settings that can be used to control or improve the performance and convergence behavior of the CHEMKIN-CFD solver within Ansys Fluent. These parameters are accessed through the Ansys Fluent Text User Interface (TUI), through typed text commands. This appendix describes the available parameters, their default values, and their recommended use.

In general, default settings for the CHEMKIN-CFD parameters should be sufficient for most problems. However, it may be necessary to change these settings to improve performance for specific types of problems. In particular, the most appropriate solver parameters may vary depending on the nature of the chemistry set.

For example, for chemistries with many trace species that have a large impact on solution results (that is, the chemistry is "stiff"), solution tolerances should be relatively small (for example, 1.E-9 to 1.E-12 for absolute tolerances and 1.E-4 to 1.E-5 for relative tolerances). For chemistry descriptions where all of the species included are within a few orders of magnitude in terms of mass fraction, however, much looser tolerances are more appropriate. Also, depending on the characteristic time scales of the dominant chemical reactions, you may need to adjust the maximum time-step used by the CHEMKIN-CFD solver.

```

Table 1: Summary of Basic CHEMKIN-CFD Parameters (p. 5640) and Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641) summarize basic and advanced parameters, respectively. These tables include

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

descriptions of the default values and physical units, where applicable, for each of the CHEMKIN-CFD parameters, as well as a discussion of the recommended parameter usage.

Table 1: Summary of Basic CHEMKIN-CFD Parameters

Parameter	Usage	Default Value
`Print Level`	Controls the level of diagnostic printing to the CHEMKIN-CFD diagnostic output file, where 0 indicates no printing, 1 indicates standard printing, and 2 enables a verbose level of printing that provides details about the solver operations. Note that diagnostic output can significantly contribute to compute time such that high levels of printing should be avoided unless problems are encountered that require diagnosis.	0
`Absolute Tolerance for Gas-phase Species`	Controls the smallest value of a species mass fraction that will be tracked by the CHEMKIN-CFD solver convergence algorithm. This should represent either the smallest mass fraction that is of importance in the problem or, for stiff chemistry, the smallest fraction pertaining to a species that can have a significant effect through chemical reaction on other species of interest. Typical values range from 1.E-6 to 1.E-12.	1.E-8
`Relative Tolerance for Gas-phase Species`	Controls the accuracy to which gas species mass fractions are resolved. Roughly this parameter controls the number of significant digits in the solution. However, this parameter can also be important for convergence of problems with stiff chemistry, as it is important to sufficiently resolve species that have a major impact on trace species of interest. Typical values range from 1.E-3 to 1.E-5.	1.E-4
`Absolute Tolerance for Surface Species`	Controls the smallest value of a surface species site fraction that will be tracked by the CHEMKIN-CFD solver convergence algorithm. This should represent either the smallest mass fraction that is of importance in the problem or, for stiff chemistry, the smallest fraction pertaining to a species that can have a significant effect through chemical reaction on other species of interest. Typical values range from 1.E-6 to 1.E-15.	1.E-8

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameter	Usage	Default Value
Relative Tolerance for Surface Species	Controls the accuracy to which surface species site fractions are resolved. Roughly this parameter controls the number of significant digits in the solution. However, this parameter can also be important for convergence of problems with stiff chemistry, as it is important to sufficiently resolve species that have a major impact on trace species of interest. Typical values range from 1.E-3 to 1.E-5.	1.E-4

Table 2: Summary of Advanced CHEMKIN-CFD Parameters

Parameter	Usage	Default Value
Pseudo Time-stepping Solver Option	Determines which solver to use during pseudo time-stepping used to improve the initial guess in a cell for steady-state simulations. By default, it is set to 1 and a robust solver with strict error control will be used when the steady-state algorithm requires time-stepping assistance. You may optionally revert to a less accurate time-stepping technique, which may be computationally faster but more prone to failure, by setting it to zero. See Advanced Parameters Used in the Steady-State Solution Algorithm (p. 5643) for more information. This parameter is ignored for transient simulations.	1
Pseudo Time-stepping Size	This option is only relevant if the Pseudo Time-stepping Solver Option is set to 1 (the default setting). This controls the time interval for time-stepping when time-stepping is used to assist a steady-state calculation. See Advanced Parameters Used in the Steady-State Solution Algorithm (p. 5643) for more information. A value of 1.E-4 seconds is recommended for combustion problems.	1.E-6 [seconds]
Maximum Pseudo Time-stepping Attempts	This parameter controls how many iterations between time-stepping and steady-state solution attempts can be tried before the solver gives up and registers a failure for the cell. Usually only one attempt is needed, but the maximum can be increased from this default value in difficult cases. Note that in some cases it is most efficient to ignore a small number of cell failures early on in the simulation as long as these cells recover on subsequent iterations. See Advanced Parameters Used in the Steady-State Solution Algorithm (p. 5643) for more information. A value of 10 to 100 is recommended to minimize error messages.	1
Maximum Time Step Allowed	Maximum pseudo time-step value for time integration during steady-state solution. This value is relevant to steady-state simulations only.	1.E-2 [seconds]

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Parameter	Usage	Default Value
`Minimum Time Step Allowed`	Minimum pseudo time-step value for time integration during steady-state solution. This value is relevant to steady-state simulations only.	1.E-10 [seconds]
`Initial Time Step for Solver`	Initial time-step value for use in time integration. By default, the solver will automatically choose an appropriate initial time step, which is the recommended approach. In rare cases, however, control of initial time step value may improve convergence behavior.	0 (that is, not specified) [seconds]
`Upper Bound for Gas-species Mass Fraction`	Sets the upper bounds for the gas-phase species mass fractions during steady-state solution. In some cases, it may help convergence to allow species to go slightly over the physical bounds during interim steady-state iterations rather than forcing the bounds to be one.	1.01
`Lower Bound for Gas-species Mass Fraction`	Sets the lower bounds for the gas-phase species mass fractions during steady-state solution. In some cases, it may help convergence to allow species to go slightly negative during interim steady-state iterations rather than forcing the bounds to be zero. A value as negative as about -1.E-4 may be used.	-1.E-12
`Upper Bound for Surface Site Fraction`	Sets the upper bounds for the surface species site fractions during steady-state solution. In some cases, it may help convergence to allow species to go slightly over the physical bounds during interim steady-state iterations rather than forcing the bounds to be one.	1.1
`Lower Bound for Surface Site Fraction`	Sets the lower bounds for the surface species site fractions during steady-state solution. In some cases, it may help convergence to allow species to go slightly negative during interim steady-state iterations rather than forcing the bounds to be zero.	-1.E-4
`Small Positive Value to Replace Negative Species Fractions`	This value will be used to substitute any non-positive species fractions during interim steady-state iterations. In some cases, setting this to a very small positive number may aid convergence for the steady-state solver.	1.E-12
`Enter Auxiliary Input Filename`	Currently not used. Provided for future use.	""
`Enter Arbitrary String`	Currently not used. Provided for future use.	""
`Enter Arbitrary Value`	Currently not used. Provided for future use.	0

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C.1. Advanced Parameters Used in the Steady-State Solution Algorithm

Many of the parameters listed in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641) are relevant only for steady-state solution. Here a brief description of the steady-state solution algorithm is provided in order to clarify the role of these parameters and their impact on solution convergence.

For steady-state problems, the Ansys CHEMKIN-CFD solver is called by Ansys Fluent for each cell during each Fluent iteration towards a steady state. Within each cell, the chemistry solver will attempt to determine an appropriate steady-state using a combination of a modified Newton-iteration procedure and a "pseudo" time-stepping procedure. The Newton-iteration method is used to attempt to directly iterate towards the desired solution. However, at early times in the simulation, this procedure may not succeed, especially when the initial guess is far from the actual steady solution. In such cases, the CHEMKIN-CFD module will automatically switch to a time-stepping mode to advance the initial guess closer to the physical solution. After taking a certain number of time steps, the Newton-iteration algorithm tries again. In this way, the steady-state solution is achieved with a minimum amount of time-stepping. Since time-stepping is computationally expensive, this results in a computationally efficient but robust method for achieving the steady-state solution.

You can control the number of times the CHEMKIN-CFD module is allowed to use time-stepping to advance a solution towards steady-state before reporting a failure for any individual cell (see `Maximum Pseudo Time-stepping Attempts` in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641)).

In performing the pseudo time-stepping procedure, there are two solver options - a "basic" time-stepping procedure and a "robust" time-stepping procedure (see `Pseudo Time-stepping Solver Option` in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641)). The "robust" procedure (default) uses an integration method that is very accurate with error control enforced on all solution variables. This can sometimes be more time consuming but is generally more reliable in tracking transient states towards an eventual steady condition. The "basic" solver option is much more approximate in the time-tracking technique, but is often faster and sufficiently robust for some cases.

When the "robust" time-stepping procedure is selected, you can specify the time interval used for each attempt to advance the solution using time integration (See `Pseudo Time-stepping Size` in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641)). The actual time steps used during the time integration will be automatically determined based on the rate of change of the solution variables. The time interval, however, controls the total time advanced before returning the solution to be used as the next initial guess in the Newton-iteration.method.

In addition to the pseudo time-stepping controls, you may also control certain parameters that affect the convergence behavior of the Newton-iteration algorithm itself. In particular, you can modify the solution bounds imposed during the iterations (see `Upper Bounds and Lower Bounds parameters` in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641)). By extending the bounds slightly outside of the physical limits, the Newton iteration can more easily resolve species fractions that are very near to those limits. This can be especially helpful in early iterations where variable values may be changing rapidly. It is also helpful to try to "reset" any negative species fractions to very small values between iterations, so that these values do not have unphysical effects on reaction rates. For this purpose, you can specify a small positive value, which should not exceed the specified absolute tolerance, as a replacement value for negative fractions (see `Small Positive Value to Replace Negative Species Fractions` in Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641)).

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C.2. Setting Up Monitor Cells for the Ansys CHEMKIN-CFD Chemistry Solver

At the same level of the basic-options and advanced-options in the Text User Interface, that is, under `define/models/species/CHEMKIN-CFD-parameters`, you can add, delete, and list `monitor cells`.

By specifying a `monitor cells` in the CHEMKIN-CFD options, you are requesting additional printout diagnostics for every iteration or time-step at this cell location. Such printout can add significantly to computational times and should be avoided unless there is a problem has been encountered and more diagnosis is needed.

Important:

Using monitor cells may add significantly to the job run time. It is recommended that monitor cells only be included if extra diagnosis is required to resolve a convergence problem or local mesh issue, for example.

Monitor cells are added using the `add-cell-monitor` option and providing the physical coordinates that correspond as closely as possible to the centroid location of the desired cell in the Fluent mesh. You can create more than one cell monitor and you can be delete all of them using the `delete-cell-monitor option`. You may also list the currently activated monitor cells using the `list-cell-monitor option`.

C.3. Diagnostic Files and Error Messages

In addition to the standard Ansys Fluent files produced during a run using the CHEMKIN-CFD solver, the CHEMKIN-CFD module creates special files to hold diagnostic output and error messages that may be helpful in diagnosing a problem with the pre-processing or run steps. In addition, error messages may be written in the Ansys Fluent Graphical User Interface window during run-time processing.

Table 3: Diagnostic Output Files Created During a CHEMKIN-CFD Run (p. 5644) lists additional files that may be created by the chemistry solver, the data printed to them, and an indication of where they are created in the Ansys Fluent run process. All files are created within the working directory of the simulation run. The actual names of many of the files will depend on variables, such as the chemistry-set file names, the case-file name, the cell number, iteration or time-step number, and the processor id. Such variables are indicated by < > in Table 3: Diagnostic Output Files Created During a CHEMKIN-CFD Run (p. 5644).

Table 3: Diagnostic Output Files Created During a CHEMKIN-CFD Run

Filename	When File Is Created	Contents Description
<gas_chemistry>.out	Always created during pre-processing, upon saving the CHEMKIN mechanism definition.	This file echoes back the gas-phase chemistry reaction set, species names, and elements in formatted text. In addition, detailed error messages are contained in this file in case an error is encountered while processing the gas-phase chemistry input file and gas-phase thermodynamic data.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Filename	When File Is Created	Contents Description
chem.asc	Always created during pre-processing, upon saving the CHEMKIN mechanism definition.	A "Linking File" used to transfer the pre-processed information to the CHEMKIN-CFD module at run-time. This file is typically not viewed by the user, but may occasionally be requested by Technical Support during problem diagnosis.
<surface_chemistry>.out	Created during pre-processing, only if surface chemistry box is checked in CHEMKIN mechanism definition.	This file echoes back the surface chemistry reaction set and the surface phase and species names. In addition, detailed error messages are contained in this file in case an error is encountered while processing the surface chemistry input file and surface-species thermodynamic data.
surf.asc	Created during pre-processing, only if surface chemistry box is checked in CHEMKIN mechanism definition.	A "Linking File" used to transfer the pre-processed information to the CHEMKIN-CFD module at run-time. This file is typically not viewed by the user, but may occasionally be requested by Technical Support during problem diagnosis.
<transport_data>.out	Created during pre-processing, only if transport-property box is checked in CHEMKIN mechanism definition.	This file echoes back the transport-data fitting coefficients in formatted text. In addition, detailed error messages are contained in this file in case an error is encountered while processing the gas-phase transport data.
tran.asc	Created during pre-processing, only if transport-property box is checked in CHEMKIN mechanism definition.	A "Linking File" used to transfer the pre-processed information to the CHEMKIN-CFD module at run-time. This file is typically not viewed by the user, but may occasionally be requested by Ansys Technical Support during problem diagnosis.
KINetics-log.txt	Created when the simulation run is initiated in the subdirectory fluentKINlog.	Messages are written to this file that record the progress of chemistry-set pre-processor and CHEMKIN-CFD solver. The printing level during the simulation run can be controlled by Print Level as indicated in Table 1: Summary of Basic CHEMKIN-CFD Parameters (p. 5640).
KIN-CELL_<cell_id>_<iteration_number>.DBG	Created for Monitor Cells (see Setting Up Monitor Cells for the Ansys CHEMKIN-CFD Chemistry Solver (p. 5644)) at every iteration or time-step, any time that the Print Level	Includes debug information, including the actual input sent into the CHEMKIN-CFD module by Ansys Fluent for the particular cell and iteration. This information may be requested by Ansys Technical Support when diagnosing cell failures.

Filename	When File Is Created	Contents Description
	(Table 1: Summary of Basic CHEMKIN-CFD Parameters (p. 5640)) is >0. Also created any time that a cell fails in the CHEMKIN-CFD solver and the `Print Level` is >0.	

C.4. Error Messages Printed in the Ansys Fluent Graphical User Interface

Advanced Parameters Used in the Steady-State Solution Algorithm (p. 5643) lists possible error messages that may appear in the Ansys Fluent Graphical User Interface during run using the CHEMKIN-CFD solver. The table includes recommended actions that may help resolve or narrow down the problem. In some cases, you may be referred to some of the additional diagnostic output files generated by the CHEMKIN-CFD module and listed in Table 3: Diagnostic Output Files Created During a CHEMKIN-CFD Run (p. 5644).

Table 4: Error Messages that May Be Printed to the Fluent GUI

Setting	Value
`Cannot read gas-phase chemistry input file.`	Verify the filename and file path for the gas-phase chemistry input file in the **Import CHEMKIN Format Mechanism** dialog box and re-import.
`Cannot read surface chemistry input file.`	Verify the filename and file path for the surface chemistry input file in the **Import CHEMKIN Format Mechanism** dialog box and re-import.
`Cannot read thermodynamic data file.`	Verify the filename and file path for the thermodynamic data file in the **Import CHEMKIN Format Mechanism** dialog box and re-import.
`Cannot read transport properties data file.`	Verify the filename and file path for the transport-property data file in the **Import CHEMKIN Format Mechanism** dialog box and re-import.
`Cannot read gas-phase chemistry linking data file during gas-phase pre-processing.`	Check the `<gas_chemistry>.out` file in the working directory for error messages.
`Cannot read gas-phase chemistry linking data file during surface pre-processing.`	Check the `<gas_chemistry>.out` file in the working directory for error messages.
`Cannot read gas-phase chemistry linking data file during transport pre-processing.`	Check the `<gas_chemistry>.out` file in the working directory for error messages.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting	Value
Cannot read surface chemistry linking data file during surface pre-processing.	Check the <surface_chemistry>.out file in the working directory for error messages.
Cannot read transport properties linking data file during transport pre-processing.	Check the <transport_data>.out file in the working directory for error messages.
Cannot write gas-phase chemistry output file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Cannot write surface chemistry output file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Cannot write transport properties output file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Cannot write gas-phase chemistry linking data file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Cannot write surface chemistry linking data file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Cannot write transport properties linking data file.	Check file permissions on working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
Gas-phase chemistry file is NULL.	Verify gas-phase chemistry file path in the CHEMKIN Mechanism definition and re-import the chemistry files.
Surface chemistry file is NULL.	Verify surface-chemistry file path in the CHEMKIN Mechanism definition and re-import the chemistry files.
Thermodynamic data file is NULL.	Verify thermodynamic-data file path in the CHEMKIN Mechanism definition and re-import the chemistry files
Transport properties data file is NULL.	Verify transport-data file path in the CHEMKIN Mechanism definition and re-import the chemistry files.
Failure in pre-processing of gas-phase chemistry mechanism.	Check the <gas_chemistry>.out file in the working directory for error messages.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Setting	Value
`Failure in pre-processing of surface chemistry mechanism.`	Check the `<surface_chemistry>.out` file in the working directory for error messages.
`Failure in pre-processing of transport properties.`	Check the `<transport_data>.out` file in the working directory for error messages.
`Failure in CHEMKIN Gas-phase library call.`	Check to see if the Ansys Fluent solution has diverged or has unphysical values for the variables. Try turning `Print Level` > 0 and setting a monitor cell to obtain more information.
`Failure in CHEMKIN Surface library call.`	Check to see if the Ansys Fluent solution has diverged or has unphysical values for the variables. Try turning `Print Level` > 0 and setting a monitor cell to obtain more information.
`Failure in CHEMKIN Transport library call.`	Check to see if the Ansys Fluent solution has diverged or has unphysical values for the variables. Try turning `Print Level` > 0 and setting a monitor cell to obtain more information.
`Need to run CHEMKIN-CFD PrePro-cess first.`	Re-import the CHEMKIN chemistry set and make sure it is selected in the **Species Model** dialog box (under **Setup**/**Models**).
`No surface data for the chemistry set.`	Either de-select the Surface Chemistry option in the **Import CHEMKIN Format Mechanism** dialog box, or make sure that a valid surface chemistry file is indicated.
`No transport data for the chem-istry set.`	Either de-select the Transport Data option in the **Import CHEMKIN Format Mechanism** dialog box, or make sure that a valid transport data file is indicated.
`Failure in writing data into the diagnostics file.`	Check file permissions on the working directory and make sure that there is only one CHEMKIN-CFD process using these files at a time.
`Error in CHEMKIN-CFD model, see diagnostic output file for de-tails.`	Check the `KINetics-log.txt` file in the subdirectory `fluentKINlog` for error messages. See Error Messages Printed in the Ansys Fluent Graphical User Interface (p. 5646) for more information.

C.5. Diagnostic Messages in the `KINetics-log.txt` File

The `KINetics-log.txt` file is a "catch-all" for many diagnostic messages that are generated by the CHEMKIN-CFD module. The most common types of messages are error messages related to setup or cell convergence.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cell-convergence error messages can take a variety of forms. The most common are summarized in Table 5: Other Error Messages in KINetics-log.txt (p. 5649). In general, if there are just a few failed cells at the beginning of a simulation it is safe to ignore them. When the number of failed cells continues to grow with each iteration, there is likely an issue with the problem set-up or with the chemistry data. Table 5: Other Error Messages in KINetics-log.txt (p. 5649) contains some broad suggestions of ways to improve cell-convergence behavior based on the type of cell failure message received.

Table 5: Other Error Messages in KINetics-log.txt

Error Message	Recommended Action
FAILURE INITIALIZING SETTINGS FOR THE KINetics STEADY-STATE GAS-PHASE CHEMISTRY SOLVER	Most likely suggests an error in setting the convergence criteria (that is absolute and relative tolerance) and the pseudo-steady-state time stepping parameters. Check that the user-provided values are reasonable.
WARNING: Exceeded allowed time-stepping intervals in cell	Indicates that a convergence problem was encountered during steady-state solution, where time-stepping is used to help advance the steady-state iterations. In this case, you can either ignore the message (see if the cell convergence recovers in subsequent iterations) or try to increase either the time interval or the number of allowed time-stepping intervals (See Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641) for more information).
KINETICS ERROR: SOLUTION FAILED	Indicates that the cell failed to converge (either steady-state or transient).In this case, you can either ignore the message (see if the cell convergence recovers in subsequent iterations) or try to modify some of the user-controlled parameters to improve convergence (See Table 2: Summary of Advanced CHEMKIN-CFD Parameters (p. 5641) for more information).
Warning - The transient chemistry solver tried 500 steps without convergence in this cell; 500 more steps will be allowed	Indicates that the problem is difficult to converge so that the transient solver is taking extra steps. However, it is only a warning and the cell has not actually failed. If you receive an excessive number of these messages, try reducing the absolute or relative solution tolerances that control the CHEMKIN-CFD solver.
KINETICS ERROR: Problem getting species names; Check that the CHEMKIN files have been processed correctly	Indicates a possible error in the pre-processing of the gas-phase chemistry input file. Check the <gas_chemistry>.out file for error messages.
KINETICS ERROR: Problem getting surface chemistry info; Check	Indicates a possible error in the pre-processing of the surface chemistry input file. Check the <surface_chemistry>.out file for error messages.

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Error Message	Recommended Action
`that the CHEMKIN files have been processed correctly`	
`DASPK:...`	These messages are from the CHEMKIN-CFD transient solver, DASPK. The exact message usually contains more information about the problem.

Note:

During steady-state simulations, once an iteration occurs where there are no failed cells, the effect of previously failed cells in earlier iterations is completely erased.

Appendix D. Nomenclature

A	Area (m^2, ft^2)
$\vec{a}$	Acceleration (m/s^2, ft/s^2)
a	Local speed of sound (m/s, ft/s)
c	Concentration (mass/volume, moles/volume)
C_D	Drag coefficient, defined different ways (dimensionless)
c_p, c_v	Heat capacity at constant pressure, volume (J/kg-K, Btu/lb_m- °F)
d	Diameter; $d_p$$D_p$, particle diameter (m, ft)
D_H	Hydraulic diameter (m, ft)
$_{ij}$,D	Mass diffusion coefficient (m^2/s, ft^2/s)
E	Total energy, activation energy (J, kJ, cal, Btu)
f	Mixture fraction (dimensionless)
$\vec{F}$	Force vector (N, lb_f)
F_D	Drag force (N, lb_f)
$\vec{g}$	Gravitational acceleration (m/s^2, ft/s^2); standard values = 9.80665 m/s^2, 32.1740 ft/s^2
Gr	Grashof number ≡ ratio of buoyancy forces to viscous forces (dimensionless)
H	Total enthalpy (energy/mass, energy/mole)
h	Heat transfer coefficient (W/m^2-K, Btu/ft^2-h- °F)
h	Species enthalpy; h^0, standard state enthalpy of formation (energy/mass, energy/mole)
I	Radiation intensity (energy per area of emitting surface per unit solid angle)
J	Mass flux; diffusion flux (kg/m^2-s, lb_m/ft^2-s)
K	Equilibrium constant = forward rate constant/backward rate constant (units vary)
k	Kinetic energy per unit mass (J/kg, Btu/lb_m)
k	Reaction rate constant, for example, k_1, k_{-1}, $k_{f,r}$, $k_{b,r}$ (units vary)
k	Thermal conductivity (W/m-K, Btu/ft-h- °F)
k_B	Boltzmann constant (1.38×10^{-23} J/molecule-K)
k, k_c	Mass transfer coefficient (units vary); also K, K_c
ℓ,l,L	Length scale (m, cm, ft, in)
Le	Lewis number ≡ ratio of thermal diffusivity to mass diffusivity (dimensionless)
m	Mass (g, kg, lb_m)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

$\dot{m}$ Mass flow rate (kg/s, lb_ms)

M_w Molecular weight (kg/kmol, lb_m/lb_mmol)

M Mach number ≡ ratio of fluid velocity magnitude to local speed of sound (dimensionless)

Nu Nusselt number ≡ dimensionless heat transfer or mass transfer coefficient (dimensionless); usually a function of other dimensionless groups

p Pressure (Pa, atm, mm Hg, lb_f/ft^2)

Pe Peclet number $\equiv Re \times Pr$ for heat transfer, and $\equiv Re \times Sc$ for mass transfer (dimensionless)

Pr Prandtl number ≡ ratio of momentum diffusivity to thermal diffusivity (dimensionless)

Q Flow rate of enthalpy (W, Btu/h)

q Heat flux (W/m^2, Btu/ft^2-h)

R Gas-law constant (8.31447 $\times 10^3$ J/kmol-K, 1.98588 Btu/lb_mmol- °F)

r Radius (m, ft)

$\mathcal{R}$ Reaction rate (units vary)

Ra Rayleigh number $\equiv Gr \times Pr$; measure of the strength of buoyancy-induced flow in natural (free) convection (dimensionless)

Re Reynolds number ≡ ratio of inertial forces to viscous forces (dimensionless)

S Total entropy (J/K, J/kmol-K, Btu/lb_mmol- °F)

s Species entropy; s^0, standard state entropy (J/kmol-K, Btu/lb_mmol- °F)

Sc Schmidt number ≡ ratio of momentum diffusivity to mass diffusivity (dimensionless)

S_{ij} Mean rate-of-strain tensor (s^{-1})

T Temperature (K, °C, °R, °F)

t Time (s)

U Free-stream velocity (m/s, ft/s)

u, v, w Velocity magnitude (m/s, ft/s); also written with directional subscripts (for example, v_x, v_y, v_z, v_r)

V Volume (m^3, ft^3)

$\vec{v}$ Overall velocity vector (m/s, ft/s)

We Weber number ≡ ratio of aerodynamic forces to surface tension forces (dimensionless)

X Mole fraction (dimensionless)

Y Mass fraction (dimensionless)

α Permeability, or flux per unit pressure difference (L/m^2-h-atm, ft $_3$/ft^2-h-(lb_f/ft^2))

α Thermal diffusivity (m^2/s, ft^2/s)

α Volume fraction (dimensionless)

β Coefficient of thermal expansion (K_{-1})

γ Porosity (dimensionless)

γ Ratio of specific heats, c_p/c_v (dimensionless)

Release 2024 R1 - © ANSYS, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Δ	Change in variable, final − initial (for example, Δp, Δt, ΔH, ΔS, ΔT)
δ	Delta function (units vary)
ε	Emissivity (dimensionless)
ε	Lennard-Jones energy parameter (J/molecule)
ε	Turbulent dissipation rate (m^2/s^3, ft^2/s^3)
ε	Void fraction (dimensionless)
η	Effectiveness factor (dimensionless)
η', η''	Rate exponents for reactants, products (dimensionless)
θ_r	Radiation temperature (K)
λ	Molecular mean free path (m, nm, ft)
λ	Wavelength (m, nm, Å, ft)
μ	Dynamic viscosity (cP, Pa-s, lb_m/ft-s)
ν	Kinematic viscosity (m^2/s, ft^2/s)
ν', ν''	Stoichiometric coefficients for reactants, products (dimensionless)
ρ	Density (kg/m^3, lb_m/ft^3)
σ	Stefan-Boltzmann constant ($5.67x10^{-8}$ W/m^2-K^4)
σ	Surface tension (kg/m, dyn/cm, lb_f/ft)
σ_s	Scattering coefficient (m^{-1})
$\bar{\bar{\tau}}$	Stress tensor (Pa, lb_f/ft^2)
τ	Shear stress (Pa, lb_f/ft^2)
τ	Time scale, for example, τ_c, τ_p, τ_c (s)
τ	Tortuosity, characteristic of pore structure (dimensionless)
ϕ	Equivalence ratio (dimensionless)
ϕ	Thiele modulus (dimensionless)
Ω	Angular velocity; Ω_{ij}, Mean rate of rotation tensor (s^{-1})
ω	Specific dissipation rate (s^{-1})
Ω,Ω'	Solid angle (degrees, radians, gradians)
Ω_D	Diffusion collision integral (dimensionless)
